There is a fine passage much earlier in this oration, to give due force to which it does not seem to have been needful for Sir Robert Collier to alter the order of the original. It is where (§ 120, *πέρας μὲν—διδῷ γενναίως*) Demosthenes declares what spirit animated the Athenians in lending aid to Corinth and the Thebans in spite of their ill-conduct in the Decelean war, and in face of the predominance of Lacedæmon by sea and land—to wit, a determination to brave defeat in the cause of freedom and generosity. "To all men," moralizes the orator, "the end of life is death, though one keep shut up in a closet; but it becomes the brave to strive alway for honour with a good hope before them, and to endure courageously whatever Heaven ordains." In the translation before us there is nothing gained by turning it into, "No man can escape death, the termination of all mortal life, by keeping himself hidden in a cellar; the brave should be ever ready to set forth on the path of glory, armed with high hope and courage, prepared to accept without a murmur that fate which Heaven may ordain." There may be doubts whether a better interpretation of *ἐν οἰκίσκῳ* than "closet" or "cellar" (which latter is surely very ignoble) would not be a "bird-cage," or "bird's nest," or a dovecot; and *φέρειν γενναίως* scarcely calls for such tall translation as "prepared to accept without a murmur"; but certainly the natural order of the Greek needed no transposing. We have also come upon two or three passages in the translation before us which call for some correction. In § 4 Demosthenes says of his antagonist that he has the advantage over himself in his accusation in that, having neither position nor repute, *ἐκ περιουσίας μου κατηγορεῖ*. This is only vaguely paraphrased in Sir Robert's rendering, "but as for him he risks nothing which he cannot afford to lose by his wanton accusation"; and we cannot say that Kennedy's, "The prosecution, however, is play to him," is a translation that meets the Greek words. The Simcoxes' version, "I have—I don't say what, but he can well afford to accuse me," catches the drift without conveying it; but to our thinking Mr. Holmes alone does justice to the sense by simply rendering *ἐκ περιουσίας* "at a monstrous advan-

tage," an equivalent which implies the whole of what the others have striven to bring out. Again, in § 23, Philip is described, how *αὐτὸς παρεσκευάζετο καὶ κατὰ πάντων ἐφύετο*, and this Sir R. Collier loosely renders, "was attaining a power menacing to them all." This, we submit, is not translation. What is wanting is some expression to give the idea of growth of power, and of that power swooping down on its victims. "He was waxing powerful," we might say, "to come down upon us all," or "growing up to the downfall of us all." In § 35, too, the sense of *ἐν τοῖν δυοῖν ὀβόλοιν ἐθεωροῦν ἄν* is not given in its full force, which is delicate, with reference to the charge against Demosthenes that he had not moved to exclude Philip's ambassadors from the *reserved seats* at the theatre. It has escaped our latest translator that *ἐν τοῖν δυοῖν ὀβόλοιν* is a figure of speech by which the price of the seats is put for the seats or the place it purchased. "They might," as Brandt puts it, "have paid their money at the door," or, as Messrs. Simcox render it still more literally, "they might have been spectators in the twopenny seats." To render, as Sir R. Collier does, "But without a decree of exclusion they could have seen the performance for two obols," is to make the point obscure, and is not, strictly speaking, correct.

We readily admit, however, that there is evidence of pains and a desire to be accurate on the face of Sir R. Collier's work, which we take to be meant rather as a literary feat than as a permanent assistance to students or non-students. It is the work of a scholar, not indeed of the stamp of the Messrs. Simcox or of the lamented Mr. Holmes, but of one who has carried to the judicial bench a sufficient residuum of Greek scholarship to plead as a set-off against the Greek and Latin verse and various classical accomplishments of others of its occupants.

THROSTLETHWAITE.*

THROSTLETHWAITE will not disappoint the readers of Miss Morley's first novel, *Aileen Ferrers:* but, at the same time, it will not surprise them by the revelation of any new excellences. *Aileen Ferrers* was written with admirable clearness, correctness, simplicity, and refinement. Its strength lay in the singularity of the central situation, and its weakness in a kind of timidity in dealing with all the sides of that situation. The style in *Throstlethwaite* keeps its purity, and with singular self-restraint Miss Morley resists the temptation to use the descriptive material which lies ready to her hand. She takes her heroine to Homburg, in the "age before morality," and says nothing of Russian countesses, haggard gamblers, and the rest of the stock characters of a Kursaal. She makes her heroine pass a night on the Cumberland hills, and, though she does sketch the dawn, the sketch is in two tints, and the brush is not dipped in the gold, azure, and russet of the word-painter's palette. There is thus nothing to divert the reader's attention from the characters and the plot. If the latter is less strikingly original than that of *Aileen Ferrers*, on the other hand there is some improvement in the fact that the action never drags, and that the story steadily increases in interest to the close.

In *Aileen Ferrers* Miss Morley described the perplexities of a girl of character and cultivation entangled in an odd and romantic love affair with an honest fellow far beneath her in station. In *Throstlethwaite* she describes the troubles of Ruth Charteris, a girl of character and cultivation in a position very usual in novels. Ruth discovers that her lover is not worthy of her, and she has with pain to renounce him. It is no part of Miss Morley's plan to describe with much minuteness the pain and struggle in the heart of her heroine. Ruth has to pass a dark hour, to be sure, but she "determines to do her best to be cheerful and happy." Perhaps she succeeds a little too well in this admirable resolve; perhaps Miss Morley's self-restraint has made her almost tame in this as well as in other passages. This timidity or repression is an error, if it be an error, on the right side, and in any case is a proof of the author's respect for her art. But when it is combined with a certain ignorance of the ways of men, scarcely atoned for by a most amusing knowledge of the ways of women, it lessens the charm of a very engaging story. Possibly with the intention of preventing her readers from thinking her heroine too correct, Miss Morley first introduces them to Ruth Charteris when she is doing something by no means conventional. She is the daughter of a house which an American might style one of the "first families" of the Lake district. While she is walking in a wood near "Brideswater" her dog follows a rabbit down a hole, and is lost. To her, at this moment of need, enters a "Laker." Now a Laker in the language of the first families of that country seems to mean a tourist, and to be a creature held in great contempt Nevertheless, the Laker helped Ruth to drag out her terrier, and as the business was a long one, he stood in danger of losing his train, which started from a station at the other side of the lake. As Ruth had a boat, and as the Laker could not row, she pulled him across, and thereby incurred the wrath of Leonard Barrington, with whom she had what is called an understanding. Now as this Laker turns out to be a Harrow and Cambridge man, and as he is skilled in everything, from managing land to making picture-frames, and is a "tall man of his hands," besides, it is not easy to see why Miss Morley chose to put him in the ridiculous position of needing a young lady's help to row a light boat. By way of starting every one fairly, however, she prejudices us against Leonard Barrington too. "What would even Edgar say to your rowing off in that way with any confounded tramping snob who happened to carry a lame dog a few yards for you?" It is thus that Leonard addresses the lady with whom he has an understanding, and, foreseeing that the twain are to be rivals, the reader perhaps inclines to favour the non-rowing Laker.

The nature of Ruth's understanding with Leonard Barrington is so unsatisfactory that one can hardly help sympathizing with the perplexity of his worldly and managing mother and married sister. Barrington has been a companion of the Charteris girls from their childhood, and Ruth has been the confidante of all the phases of his clever and desultory boyhood. This partnership in views has made almost all her education, and when Leonard, after various futile efforts to settle down to business, returns to Brideswater, Ruth and he merge their friendship in an unavowed love. Leonard indeed cannot afford to declare himself, because he has nothing but expectations, and these expectations only begin to look promising at the moment when the story commences. They depend on the death of Frank L'Estrange, the only son of a certain Mrs. L'Estrange who is Barrington's aunt by marriage, and the great lady and moral tyrant of the neighbourhood. As Ruth is sincerely attached both to Mrs. L'Estrange and to Frank, a pleasant boy who does not know that he is dying, she cannot listen with patience to Barrington's speculation about his own chances of becoming Mrs. L'Estrange's heir. Leonard is of so mobile a character, to be sure, that he can abandon the worldly side of the question, and declaim Mr. Tennyson's lines:—

> Oh yet we trust that somehow good
> Shall be the final goal of ill;

the "good" in this particular instance being his own succession to the L'Estrange property. But Mrs. Charteris, Ruth's mother, and Agatha, her sister, are much more plain-spoken; and as Frank L'Estrange grows weaker day by day, look on the understanding with Leonard quite favourably. "Of course it is a dreadful thing for Mrs. L'Estrange," says Agatha, "but as far as the outer world is concerned, I dare say Leonard will do just as well as Frank—and of course he will take the name."

It chanced that the position of land agent to Mrs. L'Estrange's estates fell vacant, and Frank set his heart on having a certain friend, Stephen Powys, of whom he had long lost sight, appointed to the position. This Powys was the son of a bankrupt banker, and was believed to be in need of employment. In compliance with the wish of the invalid, Leonard was sent to town to look for Stephen. He returned without him, declared that he had gone to America, or at all events could not be found, and shortly afterwards the "dreadful thing for Mrs. L'Estrange" happened, and Frank died. Mrs. L'Estrange was well aware of the attachment between Leonard and Ruth, but she was also well aware of Leonard's weakness and extravagance. After a sermon of great severity, she promised to make him her heir if for three years he would stick to business in the local bank, and would pay off his own debts in that time. As Leonard is one of the people who, like Becky Sharp, would have found it "easy to be good on five thousand a year," we can scarcely help agreeing with Agatha, the worldly Chorus of the story, that Mrs. L'Estrange is only "offering a premium on hypocrisy." He determines to do his best, however, and Agatha and her husband take Ruth abroad to distract her mind, and, in short, to put her in the way of a new wooer Now Ruth believed herself to be the last girl to justify the saw, "souvent femme varie":—

> Her conception of the sort of affection which alone could justify marriage, or make it possible, had been of a feeling stronger and deeper than any other, about which there could be no mistake, and which must fill the whole being with all the resistless force of an Atlantic tide wave; a feeling which might or might not have to be struggled against, and might even have to be suppressed and silenced, but which certainly could not have another similar affair just precede or just follow it; which might take years, or might only take days, to grow, but which it *must* take more than days or weeks to kill!

At Homburg, however, events happened which not only killed the old feeling, but started a new "Atlantic tide wave" on its resistless course. She met the Laker whom she had rowed across Brideswater. She found out that he was one of the most honourable, earnest, and meritorious of young men, who had given up excellent chances of getting on well in life to attend to his stepmother, a weak old lady whose advice in money matters had been the ruin of his father. More than this, the Laker proved to be no Laker, but the long-lost Stephen Powys, whom Leonard had actually met in town, but whom, for reasons of his own, he had represented as having emigrated. The motive of this dishonourable conduct really appears to us scarcely sufficient to have driven a man not without some kind of common sense to so mean a course. To put it shortly, Leonard when in town had been taken by a friend to a gambling house. Powys the virtuous had also been led by an acquaintance into the same scene of dissipation. Both were quite unused to the ways of that bad place, but Leonard played and lost, while Powys only looked on in sorrow, and detected some one cheating. A confused scene followed, in which Leonard found out who Powys was, while Powys was left in the dark as to the personality of Leonard. Now is it likely that Leonard could suppose that, if Powys became Mrs. L'Estrange's land agent, he would tell the story of the gambling quarrel, in which he was himself involved? Men do not tell this sort of tale out of school; at all events they do not tell it to old ladies, especially when they themselves are implicated. Leonard, however, as

* *Throstlethwaite.* By Susan Morley. London: Henry S. King & Co. 1875.

we have seen, did not reason in this way, and committed himself to a falsehood.

When Ruth hears of this disgraceful action, she writes at once, though guardedly, to Mrs. L'Estrange, and, more in sorrow than in anger, to Leonard. That shifty youth manages to satisfy Mrs. L'Estrange, but he pains Ruth more than ever by seeing nothing very bad in his own conduct. Time passes, Powys goes to Bridgewater, and takes the agency. Ruth returns to her family, and she and Powys begin to fall in love with each other. Leonard all the time tries to do his best at the bank, and makes some money by writing in the magazines. Mrs. L'Estrange forgives him the gambling adventure, which she comes to hear of in a not very probable way. A certain Jack Anderson who was present at the scene insists on talking about it at the top of his voice, in the presence of a number of ladies at a skating party, neither the sort of company nor the sort of place in which men delight to converse about rather disreputable amusements. No one, however, except Powys, Ruth, and Leonard knows the real extent of the young man's iniquity. The position is thus a difficult one, for Leonard is believed by every one to be engaged to Ruth, while he himself is aware that she knows too much about him, and Powys and Ruth make shy, but obvious, advances to each other.

This state of things might have dragged on for months, if Leonard had not committed himself in a new and scandalous way. Some diamonds had been deposited at the bank in which he was a clerk by a lady who died suddenly abroad. The diamonds were looked for and could not be found, but Leonard's ring was discovered in the drawer where they used to be kept. This happened in his absence, and, as he was expected to return to find a criminal charge against him, Ruth wandered across the mountains in the mist and moonlight, to meet his train at a side station, and give him warning of what was in store for him. Ruth lost her way in the mist, where she was found by Powys. He had been more successful: he had met Leonard before he reached the county town, and found that, as usual, he had a tolerably plausible account to give of the whereabouts of the diamonds. As Powys rowed Ruth across the lake that morning—for he had learnt to row by this time—the pair became satisfied that feelings do not take so very long to kill, and that new Atlantic waves of affection may rise mountains high within a very few months after the old wave has foamed and gone.

Agatha may be allowed to speak the epilogue:—

"Ruth always *was* odd, mamma, you know! And, after all, this is a tolerably harmless form of eccentricity. All things considered, it is not so *very* bad a match for her, especially in her own county, where her position is safe enough. And then, you know, the Barrington's are none of them strong, and very possibly it may all come right as to Throsthethwaite in the end, though, of course, one mustn't say so."

Mrs. L'Estrange, in short, had given up trying Leonard's virtue and resolution, and had wisely determined to put him out of the reach of mean temptations by making him her heir, with a reversion to Ruth in case he should die childless. That young lady is thus left in a position of happiness and prosperity which her sweetness of temper, honesty, and frankness deserve. These qualities have from the beginning been so well marked in her that the reader feels as sure that she will come well out of every trial as he does that certain muscular heroes of action will always be able to knock their enemies down. Perhaps this absolute security somewhat weakens the interest of *Throsthethwaite*. Miss Morley has been almost perfectly successful within the bounds that she has set herself, but then these bounds are rather narrow. One feels the want of more original motives, more passionate characters, more spontaneous humour, a wider circle of interests, a larger air.

FRENCH LITERATURE.

M. TAINE'S new work, so long advertised, has at last appeared; it will no doubt attract considerable notice, and it deserves to be closely and carefully studied. Whatever opinion we may have of M. Taine's theories, all competent critics must agree in doing homage to his talent, and, what is more, to the conscientious manner in which he sits down to his self-imposed task. After having, so to speak, sown his wild oats in the clever but somewhat flippant volume on the French Philosophers of the Nineteenth Century, he has gradually assumed a calmer tone; his History of English Literature, with all its imperfections (and they are many), is a remarkable work, and the volume we have now to notice * strikes us as far superior to his former productions. It is evident that, if we wish to appreciate contemporary France with anything like fairness, we must know its antecedents; we must ascertain how the *bourgeoisie*, the clergy, the working classes, and the peasant population have come to be what we see them at the present time. The new order of things has its *raison d'être* in the Revolution; the Revolution, in its turn, is the result of the *ancien régime*; we have here three elements inseparable from one another, and which ought to be studied with equal care. The present volume, devoted to the description of France as it was before 1789, is therefore only the first instalment of a work which will prove, if continued as it is begun, the author's chief title to permanent reputation. Armed with illustrative documents copied and analysed in libraries and in the French Record Office, M. Taine examines minutely the structure of the political edifice; he then sketches what he terms the "character" of society properly so called—that is to say, the Paris *salons*, their influence and their value as an element in the history of civilization; the third and fourth books are taken up with a discussion of the revolutionary doctrines, their merits, the hold they obtained on the nation, and the means of propagandism they had at their disposal. The concluding part of the volume treats of the proletariate. M. Taine's conclusion is that the history of the privileged classes in France is the history of a long suicide. Suppose a man standing on the top of a very high ladder, and deliberately cutting down from under him the prop by which he is supported; you have in these few words the parable of the *ancien régime*.

Two new periodicals have started in France with the year 1876. It may be remembered that in 1866 the Roman Catholics issued, under the title *Revue des questions historiques*, a quarterly, magazine professedly designed to survey the wide expanse of ancient and modern history from the point of view of the strictest orthodoxy; the editors aimed at showing the hollowness of revolutionary and free-thinking doctrines, and at rectifying what they considered to be the fallacies of the school represented in history by such writers as M. Thiers, M. Henry Martin, Mr. Froude, and Mr Buckle, and in philosophy by M. Renan, M. Littré, &c. The *Revue des questions historiques*, supported by a band of able contributors, has held its ground up to the present time; and the success it has obtained is no doubt the reason why the *Revue historique* * now comes forth as a fresh candidate for public favour. The names of MM. G. Monod and G. Fagniez warrant the belief that the new periodical will be ably and fairly conducted. The editors undertake to deal with historical questions on their own merits, and not to allow themselves to be biassed by religious or political sympathies; but we cannot help doubting the possibility of discussing points of either Church or secular history without giving an opinion about them. In spite of all declarations to the contrary, the *Revue historique* will be immediately set down as the organ of the Free-thinkers; meanwhile its introductory number is attractive. Besides the opening article on the progress of historical studies in France since the sixteenth century, we notice a curious essay by M. Chérue on the relations between Saint-Simon and Cardinal Dubois, and M. Sorel's interesting account of the Duke of Brunswick in connexion with the first French Revolution. Mr. S. R. Gardiner is the English correspondent of the *Revue historique*.

The second periodical of which we have to speak is essentially philosophical, in the French sense of the word—that is to say, it deals with metaphysics, ethics, logic, and psychology, concerning itself with natural science only in so far as it affects those branches of speculation.† M. Ribot, the editor of the *Revue philosophique*, professes complete neutrality; he begins by remarking that no common ground has as yet existed in France where the various schools of metaphysics could put forward their respective claims and contend for their several views of truth; this difficulty is now removed, and no one will be able to complain that he has no opportunity of making himself heard. In addition to a few notices of books and journals, the present number contains three important articles—one by M. Taine on the acquisition of language by children and by primitive races; another, from the pen of M. Janet, on final causes; and a third, by Mr. Herbert Spencer (translated into French), on comparative psychology.

M. Claudio Jannet ‡ tells us that he has closely observed the social and political life of the United States of America, and he comes to the conclusion that they are in a condition of decay, which began to manifest itself shortly after Jefferson's Presidency, but which the War of Secession has rapidly developed. M. Le Play introduces the volume by a remarkable preface. The causes of the ruin which threatens the United States, says M. Le Play, are identically the same as those which have been so injurious to France; and the admiration with which De Tocqueville and other Liberals regard the institutions of North America is, he considers, an error against which it is impossible to protest too loudly. To begin at the beginning, the intervention of the French Government in 1778 between England and its colonies was an act of suicide on the part of Louis XVI.; and the treaty negotiated through the mediation of Franklin was a flagrant violation of the principles of international law. Whilst La Fayette, carried away by a foolish admiration of Republican principles, did his best to encourage contempt for authority, Jefferson endeavoured, on his side, to destroy the notions of order, religion, and morality which the early colonists had brought with them from the mother-country; so that, whilst in England, thanks to the influence of Johnson and Burke, the governing classes made rapid strides in the right direction, the contrary has been the case on the other side of the Atlantic, where even religion itself is gradually losing its hold on the population. La Fayette and De Tocqueville fell into the error of believing that the early prosperity of the United States was the result of Republican institutions, whereas it really originated with the virtues of men trained under the English monarchical *régime*. M. Le Play is of opinion that since the publication of Rousseau's *Contrat social* no work has done so much harm as De Tocqueville's *Démocratie en Amérique*, and M. Jannet's volume is taken up with a demonstration of the same

* *Les origines de la France contemporaine.* Par H. Taine. Vol. I. L'ancien régime. Paris and London: L. Hachette & Co.

proposition. Our author, whilst discussing the affairs of the American Union, professedly writes for the edification of his own fellow-citizens. His remarks on the sovereignty of the people, and on the necessity of limiting universal suffrage, are obviously intended as applicable to France, and M. Gambetta is sharply criticized under the person of General Grant.

The third series of M. Van de Weyer's *Opuscules** is a posthumous work, and it is accompanied by a biographical introduction which is full of melancholy interest. The essays themselves are of the most varied kind, including short philosophical papers, literary articles, one or two political critiques, and even poetical effusions. M. Van de Weyer has left behind him a reputation which many public characters might envy; and all who had the pleasure of his acquaintance will readily endorse the following remarks uttered by one well qualified to speak on the subject:—"He was singularly truthful, simple, and gentle-hearted. A rare quality of unselfishness was peculiar to him, acting upon a principle which was implied but never expressed, that the duty and happiness of man lay, after all, in living for others, and not for himself." The article entitled "Il faut savoir dire non" is an excellent specimen of M. Van de Weyer's literary talent, and it enforces a precept upon which even the kindest-hearted persons often find it necessary to act.

At the present time information about Montenegro and the Herzegovina is specially valuable, provided it be trustworthy. We have therefore turned with interest to the new volume† published by M. Plon. Nor have we been disappointed. Messrs. Foilley and Wlahovitj are not to be confounded with the usual herd of tourists. A residence of five years in the Slavonic provinces of the Ottoman Empire enables them to give us a mass of information as to the institutions, government, and political life of those districts which travellers in general would either be unable to supply or would perhaps consider as dull and heavy. A valuable historical introduction opens the volume; details on physical science come next; and, after having described the habits and customs of the Montenegrins, and taken us on a tour from Trieste to Ostrog, the authors devote a series of chapters to political considerations. The particulars given respecting Prince Nicholas I. are unusually interesting. The descriptions of the microscopic Court of Montenegro, with its mixture of feudal and Eastern manners, the narrative of the insurrection of 1869, and the discussion of the claims of the Montenegrins to independence, are all well calculated to arrest the attention of the reader. The volume is illustrated with a good map and ten woodcuts.

One of the most interesting series of volumes in the late M. Jannet's *Bibliothèque Elzévirienne* was the collection edited by M. A. de Montaiglon under the title *Recueil de poésies françaises des quinzième et seizième siècles*; it had reached its ninth volume, and was intended to be completed by one more, containing a glossary and index. But in the meanwhile M. James de Rothschild placed at M. de Montaiglon's disposal a large number of poems belonging to the same category which had the merit either of extreme rarity or of having never been printed before. Thus it is that the *Recueil de poésies*‡ will extend probably to twenty volumes instead of ten, and the learning of M. de Rothschild is now called in to supplement that of the accomplished lecturer at the École des Chartes. The present duodecimo‖ contains twenty-three pieces, all extremely curious and of rare occurrence; some of them had escaped Brunet's notice; of others only a single copy was known to exist; most lay concealed in the libraries of Paris, Geneva, and London; a few are taken from the private collections of bibliophilists. At a recent sitting of the Académie des Inscriptions et Belles-Lettres, M. N. de Wailly pointed out the philological importance of the volume before us; some of the pieces, although written in the sorriest doggrel, are highly valuable in an historical point of view, and the annotations and introductory remarks deserve also to be mentioned.

M. Eugène Réaume has made a special study of the French authors of the Renaissance period; in 1869 he published a volume of notices devoted to the prose writers of that time, and he has since been engaged on an edition of Agrippa d'Aubigné's works. The present book §, got up in the most unpretending manner, is intended for school purposes; it is an excellent protest against the popular fallacy of holding up the great writers of the seventeenth and eighteenth centuries exclusively to the admiration of young students; and its aim is to answer the requirements of the educational programme of 1874, which at last places Montaigne, Amyot, Ronsard, and L'Hôpital on the list of authors to be studied by the pupils of the French Lycées. The volume begins with a short historical preface on the general character of the Renaissance and Reformation era; a philological essay comes next, in which the author discusses the principal features of sixteenth-century grammar; then follow the illustrative extracts, each contributor being dealt with in a concise biographical sketch, and the prose writers being separated from the poets by dramatic specimens to which Jodelle, Larivey, Garnier, Grevin, and others have supplied various choice pieces. M. Réaume's account of the old French stage, added as a preface to this part of the volume, is not its least interesting feature. The notes are copious, the glossary of archaisms is very complete, and the alphabetical index of persons quoted or alluded to terminates what we must pronounce to be one of the best school books lately published.

M. Meunier, Professor of Geology at the Paris Museum of Natural History, has brought out two works which deserve far fuller notice than we can now give them. The lectures on comparative geology must be named first*, and although the word "geology" may perhaps be objected to as unsuitable in a book treating, not of the earth alone, but of all the planetary bodies, it is difficult to say what other word could have been selected. M. Meunier's researches into the phenomena connected with light, and into the mass, the rapidity, and the general characteristics of the planets, are highly interesting; but perhaps the most striking thing in the work is the chain of inferences derived from the author's observations. Adopting a cosmogonic theory akin to that of Laplace, which he, however, completes, M. Meunier considers our solar system as one grand geological whole; the planets are fragments of it, successively detached from the central mass, this mass itself still subsisting as an incandescent substance in the sun.

Another work† for which we are indebted to M. Meunier may be considered as forming part of the history of Paris. Cuvier and Brongniart had already examined the geology of that city and its environs in a book the last edition of which was published forty years ago. Vicomte d'Archiac's *Histoire des progrès de la géologie*, issued in 1851, contains also a chapter on the same subject; but even since that comparatively recent period discoveries of every kind have been made in the various branches of geological science, so far as Paris is concerned, and we have to thank M. Meunier for giving us the result of these discoveries. Not that he appears in this volume as a mere reporter of other men's researches; on the contrary, many of the observations made are entirely his own, and they bear evidence to his scientific attainments.

The Académie Française has already twice awarded a prize to Mme. Blanchecotte for her useful contributions to ethical science; and the present volume‡ sustains her reputation. As the title sufficiently shows, it is the result of observations made during a life-time. Man, says Mme. Blanchecotte, may be compared to a traveller *en route* for eternity; he sketches, whilst on his way, the most striking landscapes; he notes down the best hotels, the safest encampments, the shortest roads; he records likewise the dangerous and treacherous paths; and generously bequeaths to those who shall follow him the results of his experience. Remarking on the frequent cases of suicide which appear in the columns of the French newspapers, the author traces them to the want of faith characteristic of the present generation; it is high time, she says, that some attempt should be made to raise men from the depths of selfishness and materialism into which they have sunk; and Mme. Blanchecotte's ambition is to play her part, however small, in the work of regeneration. Hence this book, composed of detached thoughts classified under various heads; we recommend especially the chapter entitled "Lettres à nobody."

"Sonnet . . . c'est un sonnet," exclaimed Trissotin of yore. In the volume before us § we find no fewer than one hundred and forty of these small poems. They are divided into sets of ten; eight sets representing the period comprised between Mellin de Saint-Gelais and Jean-Baptiste Rousseau, whilst the nineteenth century claims all the rest. We have it on Boileau's authority that

> Un sonnet sans défaut vaut seul un long poème;

and some of those included in this collection are certainly gems of this kind; a few made quite a commotion at the time when they appeared, and persons acquainted with the French literature of the *Précieux* style could tell us how the Uranistes headed by Voiture, and the Jobelins conducted by Benserade, fought it out in Mme. de Rambouillet's *salon*. We cannot say that sonnet literature improves as we draw nearer our own days, and there is not one of these compositions belonging to contemporary authors that can be compared with the *chefs-d'œuvre* produced by Ronsard, Clement Marot, or even Charleval. The famous sonnet composed by Desbarreaux after his conversion has never yet been equalled, and Scarron's *sonnet comique* is in its way a perfect wonder. M. Asselineau, the learned editor of this volume, has given in an excellent historical introduction a complete account of sonnet-writing in France since its origin, and the notes supply likewise a variety of useful illustrations; but we are bound to say that the poems contributed by our own epoch might very profitably have been curtailed.

After MM. Ducis, Letourneur, Guizot, François-Victor Hugo, E. Montégut, and Benjamin Laroche, another scholar has endeavoured to grapple with Shakspeare, and to clothe him in a French dress. The difficulty which M. Alcide Cayrou had to overcome was unusually great, for his translation‖ is not a commonplace prose rendering of the original; he applies the formal Alexandrine to the English dramatist, and the necessities of rhyme oblige him more than once either to sacrifice accuracy or

to introduce superfluous words belonging to the class of what our neighbours call *chevilles*. The plays selected for translation are *Hamlet*, *Macbeth*, *Othello*, *Romeo and Juliet*. M. Mézières, recently elected a member of the French Academy, and thoroughly acquainted with the dramatic literature of the Elizabethan era, has added a preface, which is somewhat disappointing by its brevity and meagreness. M. Guyrou's enthusiasm for Shakspeare is most creditable; but we must say that, whatever liberties may be taken with the Racinian Alexandrine (and they are such in these two volumes that several of the passages read like prose), it utterly fails in the present instance. German is the only adequate language for a metrical translation of Shakspeare and the French must remain satisfied with a prose version aiming solely at accuracy.

M. Marius Topin is already favourably known by a volume on the Man with the Iron Mask. We reviewed it some time ago, and did justice to the author's learning, although we could not satisfy ourselves that he had solved the mysterious problem which has puzzled so many before him. On the present occasion he attempts * to prove a thesis put forth originally by M. Cousin, to the effect that Louis XIII. really countenanced Richelieu's policy, and admired it, instead of being the weak, wavering monarch that historians represent him to have been, obliged to bend under the Cardinal's yoke. M. Topin has had the opportunity of studying upwards of two hundred letters in the King's own handwriting, addressed to Richelieu, and it is chiefly on this mass of evidence that he takes up his position for the purpose of rehabilitating the memory of Louis XIII. The volume before us is divided into three parts; the first being devoted to a brief sketch of the reign. With the help of documents found by him in the French Foreign Office, M. Topin is enabled to correct many blunders which had been received as facts by the best writers, even by M. Cousin and M. Avenel, the learned editor of Richelieu's correspondence. The second part of the work comprises the letters discovered by M. Topin; they embrace the period of twenty years beginning with the death of Constable de Luynes, and are copiously illustrated with notes and historical commentaries. Finally, we have an account of the last days of Louis XIII. and Richelieu, ending with a general estimate of the King and his illustrious Minister. If Richelieu obtained such extraordinary power, it was merely, says our author, because the King was actuated by enlightened patriotism, and the Cardinal was unreservedly devoted to the interests of France. It need scarcely be proved that Richelieu's unquestionable genius is in no way diminished by the fact that Louis XIII. was not a *roi-fainéant*.

M. Jules Arène, who has spent some time in China, now gives us the result of his impressions.† We are not asked here to study the "Celestial Empire" in its classical dress, as the works of MM. Stanislas Julien and Panthier present it to us. M. Jules Arène's Chinaman is the regular "heathen Chinee" of the nineteenth century—that is to say, a specimen of all the worst qualities which belong to the human race; the poetry he writes is as inferior to that which we have been accustomed to admire as the famous "willow-pattern" dinner service is to old china; and if under the Ming dynasty John Chinaman's code of morality was of a somewhat loose character, it suggested at any rate lyrics and tales far superior to those quoted by M. Arène.

It is possible, however, that our traveller may have calumniated the ladies of the "Celestial Empire," just as M. Ernest d'Hervilly, if report speaks truly, has grossly misrepresented *mesdames les Parisiennes*. We hope, at all events, that the objectionable stories introduced by M. d'Hervilly in his volume will not be regarded as specimens of Parisian life in the best sense of the word.

The January number of the *Bibliothèque universelle* is§ a good beginning of the volume for 1876. M. de Montalembert's essay on Spanish history, rejected by the *Correspondant* on account of its Liberal tone, and M. Tallichet's biographical sketch of Alexandre Vinet, are excellent articles.

ADVERTISEMENTS.

THE SOCIETY of PAINTERS in WATER COLOURS.—The FOURTEENTH WINTER EXHIBITION of SKETCHES and STUDIES is NOW OPEN, 5 Pall Mall East. Ten till Five. Admission 1s.
ALFRED D. FRIPP, Sec.

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the PRAETORIUM," with "Dream of Pilate's Wife," "The Night of the Crucifixion," "La Vigne," "Soldiers of the Cross," "Christian Martyrs," "Gaining Calvary," &c.—DORÉ GALLERY, 35 New Bond Street. Ten to Six. Admission, 1s.

ELIJAH WALTON. WINTER EXHIBITION now OPEN.—A Large Collection of Fine Water-Colour Drawings on VIEW, and for SALE. Burlington Gallery, 191 Piccadilly. Ten till Dusk. Admission, including Catalogue, 1s.

QUEEN'S COLLEGE, 43 and 45 Harley Street, W.—Mr. W. G. CUSINS, Professor of Instrumental Music, will give TWO MUSICAL RECITALS, on Wednesday, February 9 and 23, at Four P.M. Tickets and Programmes may be had on application to Miss GROVE, at the College Office.
E. H. PLUMPTRE, D.D., *Principal.*

CHELTENHAM COLLEGE.—TWELVE SCHOLARSHIPS. Eight £40; Four £20. Election, Second Week in May.—Apply to the SECRETARY, the College, Cheltenham.

RADLEY COLLEGE SCHOLARSHIPS.—An ELECTION to the SEWELL SCHOLARSHIP, value £55, and FOUR other ENTRANCE SCHOLARSHIPS, Two of £50, One of £30, and One of £28, will be held on Wednesday, May 10, 1876. They are all tenable for Four years.—Apply to the BURSAR, Radley College, Abingdon.

CLIFTON COLLEGE SCHOLARSH will be open to COMPETITION at Midsummer, 1876, value from £25 to £50 a year, which may be increased from a special fund to £80 a year in cases of Scholars who require it.—SECRETARY, the College, Clifton, Bristol.

ALDENHAM GRAMMAR SCHOOL (near Watford). Founded A.D. 1597.
Under the New Scheme, Nine Exhibitions are founded, of the value of £50 per annum for Three Years.
Also, Ten Junior and Ten Senior Platt Scholarships are to be established, the first to defray about one-half, the latter nearly the whole, of the expense of maintenance and education in the School.
Further information will be given on application to the Rev. ALFRED LEMAN, Head-Master.

TORQUAY.—HOREST HALL, Warberry Hill, PREPARATION for the PUBLIC SCHOOLS and UNIVERSITIES, under the Rev. T. R. R. STEBBING, M.A., sometime Fellow and Tutor of Worcester College, Oxford, First and Second Class Classics, First Class in Law and Modern History, and formerly Tutor and Assistant Master at Wellington College. The situation is lofty and salubrious. The Pupils are treated as members of the Family. Fees under Fourteen, 150 Guineas; over Fourteen, 200 Guineas.

HURSLEY, WINCHESTER.—A. M. HEATHCOTE, B.A. Oxford, prepares BOYS, between Seven and Twelve, for Public Schools. Terms, 100 and 120 Guineas. Holidays as at Winchester College. After Easter he can receive Two or Three Boys.—Address, Home Close, Hursley, Winchester.

HANOVER.—PRIVATE TUITION.—The ENGLISH CHAPLAIN (a Cambridge M.A., with Mathematical Honours), who undertakes the Care and Education of Four PUPILS, has VACANCIES. A German resides in family.—Address, Rev. R. G. WILKINS, 5 Bohmer Strasse.

WOOLWICH, LINE, CONTROL, COOPER'S HILL.—Rev. Dr. HUGHES (Wrang. Cam.), who has passed over 300, has VACANCIES for the next Examinations. Classical, Science, French, German, and Drawing Tutors. He can also receive (quite distinct) younger PUPILS for a more extended course.—Ealing, W.

PRIVATE TUITION and COMFORTABLE HOME.—The RECTOR (Married) of a small Country Parish, an old Rugbeian and Graduate of Trinity College, Cambridge, who takes FIVE PUPILS, has Vacancies. Classics, Mathematics, French, and thorough German. Peculiar advantages for young men fond of country life and pursuits. Shooting, fishing, and hunting, if desired. Terms (inclusive), 150 to 200 Guineas. Address, Rev. H. R. L., Woldgate Rectory, Much Wenlock, Salop.

PRIVATE TUITION.—The Rev. F. W. YOUNG, M.A., Oxon, Scholar of his College, three of whose Pupils (11, 13, and 15 years) have recently gained open Public School Scholarships, Receives a few high-class PUPILS. He is assisted by an Eighth Wrangler, an Oxford Honourman, and other [illegible] every facility for the Modern Languages, and unusual advantages to B. to Parents of Position. Inclusive terms, 100 Guineas.—Cherbourg.

COMPETITIVE EXAMINATIONS.—Army, Ceylon Writerships, Indian Forests, Chinese Interpreterships, Factories, &c.—Mr. W. M. LUPTON, Author of several Manuals for the Competitive Examinations, has been most successful in passing Candidates for the above.—9 Rathbone Place, Oxford Street.

TO MILITIA OFFICERS and CANDIDATES for COMPETITIVE EXAMINATIONS.—Captain CHAWNER (late 27th Regiment) will have THREE VACANCIES after the December Examinations. Terms on application, and references.—The Manor House, Newton Valence, Alton, Hants.

SCARBOROUGH.—A LADY and GENTLEMAN wish to receive into their Family One or Two LITTLE GIRLS, of about the same age as their only Daughter, who is now Six, to be brought up and Educated with her, and of whom they would take entire charge. The highest references.—Address, W. E., Theakston's Library, Scarborough.

THE OPENING OF THE SESSION.

A SESSION which will certainly not be devoid of interest, but which may perhaps be free from any serious party excitement or contest, was opened on Tuesday by the QUEEN in person. It is some years since the QUEEN has felt herself equal to the discharge of a duty which, however gifted she may be with the qualities necessary to perform it with dignity and grace, must still be inevitably onerous and trying. It is always a satisfaction to the public when circumstances permit HER MAJESTY to go through any of the great ceremonials of State without the tax on her strength being unduly severe; and there is a general feeling that a Session begins well when the QUEEN presides at its opening. On the present occasion she had to touch on a subject deeply interesting to herself as well as to the nation, and the success of the visit of the PRINCE OF WALES to India has been so indisputable that there was no reason to fear lest anything she might say should evoke even a whisper of dissent. By a pure accident the occasion of the QUEEN'S visit to Westminster was also the occasion of the signal collapse of a KENEALY demonstration; and it is not perhaps a bad beginning of a Session that an incident at its opening should seem to warrant the supposition that even the humblest and most ignorant of the QUEEN'S subjects can ultimately detect a vulgar imposture. Foreign affairs necessarily took up the greater part of the Speech from the Throne, and the list of home measures was unusually brief. Mr. DISRAELI, during the debate on the Address, justified its brevity by observing that, if the Government furnished a long list of measures which it proposed to carry, experience showed not only that it is impossible all should be carried, but that the world very unjustly forgets those which are carried to remember exclusively those which are not carried. The path to glory seems, therefore, to lie in proposing to do scarcely anything, and then every achievement beyond these modest bounds will come as a surprise, and the country will be delighted to find itself in the hands of a Ministry which does, not merely what it proposes to do, but a great deal more. The constitution of the Final Tribunal of Appeal, and the replacement of the temporary regulations passed last Session with regard to merchant shipping by a permanent Act, were objects which the Government was pledged to accomplish in the most satisfactory way it could devise. The inclosure of commons and the management of prisons are, no doubt, in themselves matters of importance, but scarcely of the importance which might have been expected to secure them notice in the QUEEN'S Speech. It is different with the regulation of the Universities and the organization of primary education. Their importance is unquestionable, and the Ministry has shown commendable boldness in attempting to deal with them. Whatever is proposed is sure to run counter to the feelings, prejudices, and beliefs of innumerable critics, and perhaps no two subjects could be named on which it would be harder for the Government to hit the exact point of moderation which will satisfy, not cliques and sects—for to satisfy them is impossible—but the nation at large.

Ill-luck in the ballot for the order of precedence of the Bills of private members has determined Mr. OSBORNE MORGAN to withdraw his Burials Bill and to substitute a Resolution. It may turn out to be advantageous for all parties that this course should have been forced on him, as it may lead the House to determine a preliminary question which it is desirable to have decided. The objection to the Burials Bill may be, that it proposes to take away from the Established Church the exclusive custody or ownership of churchyards; or the objection may be that, if this exclusiveness were impaired, there would be no security against scenes painfully jarring on the feelings of reverent and pious people. If the first is the objection entertained by the majority of the House, it is obvious that there can be no Burials Bill at all; if it is the second that is entertained, then the question will be what valid securities can be suggested by the promoters of the Bill. The Irish members appear to be more fortunate than Mr. MORGAN, and a long list of Bills has been announced which different Home Rulers are to bring forward. Ireland was not noticed at all in the QUEEN'S Speech, and the seconder of the Address in the Commons, representing an Irish constituency, noticed this at once as a novelty and as a sign that things were going on well in Ireland, and that the country was becoming peaceful and prosperous. Nothing could be more vexatious to Home Rulers than that this assumption should be supposed to be warranted. Mr. RONAYNE especially set himself to combat it. He presumed that Mr. MULHOLLAND was judging of all Ireland from the point of view of Belfast. Even as to Belfast he could state that he had heard much growling as to the state of trade there, and certainly, if no place is to be held prosperous until all growling has ceased in it, it is hopeless to dream of prosperity anywhere. Whatever may be the truth as to Belfast, nothing can be more foolish in the eyes of Mr. RONAYNE than to talk of the rest of Ireland being prosperous. No doubt, as he admitted, the amount of deposits in the banks rapidly increases, but that is only because the farmers pull their hoards out of old stockings, and take them to the banks. That such a process should conduce to the wealth of the country has not entered Mr. RONAYNE'S innocent and virgin mind. It is true, as he also admitted, that wages in Ireland have risen considerably; but he urged that the labourer was no better off, for the prices of everything had also risen; and in the next place the labourer was better off, but this was only because half the population had been killed or driven away. In time perhaps Mr. RONAYNE may suspect that it has been a gain to him that the absence of Home Rule has obliged him to address an audience with which arguments flagrantly conflicting do not have much weight.

The course taken by the Ministry in referring the questions involved in the Slave Circulars to a Royal Commission is open to very serious objection. The Government has entirely abandoned the first Circular, owning its responsibility, but stating that its issue was a blunder into which it was betrayed by the erroneous opinions of its Law Officers. But the second Circular has been framed in accordance with the deliberate opinion of the highest legal authority at the command of the Government, that of Lord CAIRNS. The Ministry contend that it was necessary to issue some Circular, and that the Circular now in force is a thoroughly proper Circular, based on the proper legal doctrines. If this is so, what is there for a Royal Commission to do? There is nothing whatever for it to discover which the Government does not know already. It is ridiculous to ask a Commission to inquire whether Lord CAIRNS is right in point of law. Our existing engagements and treaties, and all the contents of all previous Circulars, are perfectly well known to the Foreign Office. The Royal Commission may be of opinion that much more discretion

than the Circular contemplates should be given to captains of ships of war; but this is the very point which the Government has decided, and it is for Parliament, not for a Commission, to say whether its decision is right. The only kind of suggestion which Lord DERBY could make as to the possible utility of the Commission was that it might give hints as to what new treaties or engagements the Crown should be recommended to make if other nations will accede to them. But this is precisely the duty of the FOREIGN SECRETARY, and not of any one else. And this is especially a case where the Foreign Office ought to act, and to act in its own way. To deal rightly with the questions which the retention of fugitive slaves raises is to deal rightly with a great many small practical matters, differing very greatly in different places. It is very undesirable that England should lay down fixed general rules specifying what she requires and claims either as to her treatment of fugitive slaves or the extraterritorial character of her men of war—that she should announce these rules to the world and call on the world to acknowledge them. We shall almost certainly get into quarrels with foreign Powers if we act in this way, and we shall be quite certain to do much less than we otherwise might for the benefit of the fugitive slaves. It is equally undesirable that the history of all that the Foreign Office has done in the matter on past occasions should be revealed; and if it is not revealed, and the Royal Commission is silent as to much of which it gains knowledge, the public will have no means of judging on what grounds any decision has been arrived at, and it will be unable to derive any comfort from the labours of the Commission. For the moment perhaps the Government, by shirking its due responsibility, may gain a sort of ease, and may please itself with the hope that, by the time the Commission reports, the Slave Circulars will have been forgotten. It would be saying too much to say that this hope is an illusory one. In a few months the public may have forgotten the Slave Circulars; but it will not have forgotten that the Government showed weakness when it ought to have announced a decided and defensible policy, and that the FOREIGN SECRETARY, instead of doing his duty, has asked other people to tell him how to do it.

MINISTERS ON THE SUEZ CANAL AND TURKEY.

IT had been foreseen that the debates or speeches on the Address would relate chiefly to the two questions of foreign policy which have for some time past occupied general attention. The Suez Canal purchase will be more fully discussed on Monday next, when the CHANCELLOR of the EXCHEQUER asks for a vote of the money necessary to indemnify Messrs. ROTHSCHILD; but the papers which have been published contain the meagre history of the transaction, and Lord DERBY and Mr. DISRAELI, while they touched lightly on the financial character of the investment, sufficiently explained both the general reasons for the purchase and the motives for immediate acceptance of the KHEDIVE'S offer. Lord DERBY repudiated the interpretation which had been not unnaturally placed on his Edinburgh speech. He now explains that he only denied that the purchase was a departure from the habitual policy of England, and was connected with any project of an Egyptian protectorate, or of participation in the dismemberment of Turkey. It appears that negotiations are in progress which may perhaps result in securing to the English Government a share proportioned to its interests in the management of the Canal; but if such an arrangement is for any reason deferred, the acquisition of nearly half the capital will not fail to confer corresponding influence on the owner. As Lord DERBY said, those who hold the opposite opinion assume the position of a man who denies that two and two make four. M. DE LESSEPS furnished a sufficient justification for the purchase when, either relying on the support of the French Government or wishing to test its policy and resolution, he threatened in 1874 to stop the traffic of the Canal. In days when French ambition was more restless the experiment might probably have succeeded. According to Mr. DISRAELI there was some difficulty in inducing the SULTAN and the KHEDIVE to despatch a force to protect the navigation from interruption. It is not likely that the KHEDIVE would have determined to undertake the management of the Canal in the face of a French protest. The aid which the French Ambassador had, under the instructions of his Government, afforded to M. DE LESSEPS during the sitting of the Commission at Constantinople was professedly given because the greater part of the capital of the Company was held by French shareholders. If the English Government had previously effected the purchase, either a different policy must have been adopted or a new explanation must have been devised. If M. DE LESSEPS treated the undertaking as French while nearly half the shares belonged to the KHEDIVE, he would more plausibly have appealed to national pride and jealousy if either a French Ministry or a body of French capitalists had anticipated the action of the English Government.

As the Duke of SOMERSET truly said, the risk which was barely averted in 1874 was one of the complications which Lord PALMERSTON had formerly anticipated. The difficulty might have assumed a still more serious form if M. DE LESSEPS, instead of closing the Canal, had refused admission to the vessels of any nation which objected to the augmentation of tolls. France would have accepted the increased tariff, and Russian ships would, if necessary, have been franked through the Canal by means of a Government subsidy. The indignation which would have been caused by the exclusion of English shipping would have been more formidable than the plausible objections to the purchase which are expounded in the *Edinburgh Review*. One or two propositions to which Lord HARTINGTON seemed to commit himself exhibited less than his usual caution. It was a waste of ingenuity to attempt to prove that the shares might have been bought cheaper; and it was unnecessary to announce that the KHEDIVE would be bound in time of war to close the Canal to all belligerents. Mr. DISRAELI, who judiciously declined to anticipate the contingencies of war, may probably have reflected that, when a great struggle was proceeding, the stronger combatant would certainly not allow the Egyptian Government to exercise an independent discretion. As far as the amount of the purchase money is concerned, it would have been impolitic as well as undignified to drive a hard bargain; and the KHEDIVE would rather have raised four millions at ruinous interest than a smaller sum on the moderate terms which were offered by the English Government. It is satisfactory to learn from the Ministerial statements and from the published Correspondence that foreign Governments are perfectly satisfied with the good faith of the transaction. The French might be excused if their complacency was in the first instance disturbed. The Russian theory that the purchase was an instalment of the partition of Turkey was a figment intended exclusively for domestic purposes.

On the propriety of the adhesion of the Government to the Austrian project there was little difference of opinion. Lord DERBY showed that there had been little room for choice among four possible courses of action. The English Government might have withheld its concurrence; it might have proposed a Conference; or a competing scheme of reform might have been tendered. A refusal to co-operate with the three Imperial Courts would have been followed by a Turkish rejection of Count ANDRASSY'S Note, and by ulterior consequences which can be but vaguely conjectured. A Conference is, like a Royal Commission on the law of slavery, only a device for procuring delay; and in this instance such a proposal would almost certainly have been rejected by the three allied Courts. If a Conference had been held, there would have been a majority in favour of the reforms demanded in the Note; and, with or without a Conference, it would have been idle to produce an alternative project of reform. There is little doubt about what the Porte ought to do, though there has been much dispute as to the best method of inducing the Porte to do anything. The Turkish Government itself provided the strongest argument for concurrence in the Note by intimating a wish that England should not stand aloof. It is not surprising that Turkish statesmen should be anxious to postpone or avert a collision with formidable neighbours. If foreign Powers are to intervene in the administration of Turkish provinces, it may well be thought desirable that the most sincere friend of Turkey should have the opportunity of sharing in the arrangement. Lord DERBY took occasion expressly to repudiate the inferences which have been deduced from the conduct of the Government by the implacable partisans who assail Turkey in the press:—"It is quite within our power, "I do not say to withdraw, for there is no withdrawal in "question, but to abstain from further action, without any "one being able to say that we have either disappointed ex- "pectations which we have created, or broken any engage-

"ments we have made." It was time to disclaim responsibility for the rash pledges of inconsiderate partisans.

It is premature, and it would perhaps in any event be useless, to inquire how far the spirit of the Austrian Note is consistent with the reserves of the Treaty of 1856. Lord DERBY was justified in saying that thus far there has been no infringement of the Treaty. Any Power may, at the risk of giving offence, but without violation of the common law of nations, advise any other Power to deal justly and benevolently with its subjects. In the Treaty of Paris it was proper to guard the concessions promised by the SULTAN by the provision that no foreign Government should interfere with the internal administration of the Empire. Thus far Russia, Austria, and Germany have not exceeded the license of the Treaty, inasmuch as their advice to the Porte is not enforced by any overt threat. Lord HARTINGTON reminded the House that Lord PALMERSTON himself had admitted the moral right of the European Governments to remonstrate if the promises of the SULTAN were not performed. The communication to its allies of its own good intentions to its subjects was an acknowledgment by the Porte that they had some kind of interest in the matter. A suggestion that its benevolence should assume a certain form is an additional encroachment only because there is a suspicion of force in the background. Lord HARTINGTON'S quotation from a speech of Mr. GLADSTONE delivered twenty years ago was less instructive than his reference to Lord PALMERSTON'S opinion. Mr. GLADSTONE thought in 1856, as he thinks now, that the juxtaposition of Christians and Mahometans involves difficulties which will survive the present generation. Lord PALMERSTON and the English nation have always been aware that there were two hostile creeds in Turkey, though Lord PALMERSTON'S hope that their relations might be equitably adjusted has been in great measure disappointed. Mr. GLADSTONE is not to blame for his inability to discover a remedy for the evil which he points out and deplores; but those who share his opinions ought to regard with tolerance the cold-blooded policy which acquiesces in an unavoidable evil. Foreign Governments will collect from the cautious phrases of Mr. DISRAELI and Lord DERBY their substantial adherence to the long-established policy of England. When any practicable contrivance for abating the antagonism of Turks and Christians is devised, it will be time enough to speculate on the extirpation of the Mahometan faith or the expulsion of its votaries from Europe.

GERMANY.

THE Session of the German Parliament has been brought to a close, and the main work assigned to the Parliament during the Session, that of passing the new Penal Code, has been accomplished. Before, however, the close of the Session, Prince BISMARCK appeared on the scene in the character which from to time he assumes, and generally with imposing effect, that of a person really in the secret of things, who knows what no one else can know, sees dangers where to other eyes all seems safe, and offers to take care of every one on the indispensable condition that he is allowed to act in his own way as the mysterious and magical saviour of society from an abyss. There can be no doubt that, at more than one epoch of his life, Prince BISMARCK really has had a policy the bearing of which he could not prematurely disclose, for the prosecution of which he was obliged to persuade or coerce bewildered people to find him the means, and the ultimate success of which has made Germany what it is now. But what was once a necessity has become a habit, and Prince BISMARCK is never weary of exhibiting himself as a gloomy prophet whose mission must be attended to or the globe will collapse. He is a sort of MAHOMET of culture, and the Angel GABRIEL is only too assiduous in his attendances on him. The Parliament had excited his wrath by rejecting certain clauses in the Bill by which it was proposed to deal very sharply with Socialists—that is, with members of secret Societies, and all persons in any way causing confusion by advocating opinions hostile to property, the family, and marriage. The Parliament thought this a scare, and the German public is just at present tired of scares. One of the clauses was rejected and Prince BISMARCK was furious. He came down on the House with a whole armoury of thunderbolts. He warned his hearers that he knew perfectly well what he was about. He had got his palm-leaves, he could decipher the characters on them, and his palm-leaves told him distinctly that the clauses must be passed. The German Parliament has not yet got the length of setting itself up against GABRIEL when that tutelary being is brought directly on the scene. It appears to have given way, and to have passed the clauses with what modification, if any, is not yet known, and the PRINCE, being restored to good humour, thanked the Parliament for the efficient and satisfactory way in which it had discharged its duties. The text of Prince BISMARCK'S speeches has not as yet reached us, except in an imperfect form, and no opinion can therefore be offered as to the value of his arguments and the significance of his statements; but if the general tenor of what has been reported of them is correct, the PRINCE used language which will supply both his enemies and his friends with curious matter for reflection.

Although, however, the Penal Code has been passed and Prince BISMARCK is good enough to say that he is satisfied with it, the severity of the original draft has been considerably mitigated. As it stood in its first conception, DRACO, could he have come back to earth, would have chuckled over every line of it. That stern person would, it may be imagined, have been especially tickled with a clause rendering it a criminal offence to give any encouragement, inducement, or assistance to emigration; so that, as it was remarked, a shipowner advertising cheap fares to New York might any day wake with his hair clipped and nothing but bread and water to live on. In this instance the Parliament felt sure there was something wrong about the palm-leaves, and struck the clause out altogether. There was also some opposition to two sets of provisions—those by which a change was made in German law corresponding to that forced by Germany on Belgium, and those by which misdoings like those imputed to Count ARNIM were made henceforth punishable as criminal. As these, however, were points not touching Germans generally, but touching Prince BISMARCK personally very much, the clauses, with some slight changes, were passed out of compliment to him. The position of Count ARNIM himself cannot of course be affected by the new law, and as he will not come back to Germany, the sentence already passed on him remains inoperative for the present. He thinks he has been very badly used, and Prince BISMARCK thinks he has got much less than his due punishment, and there is an end to it. The last stage in this diplomatic passage of arms has been the publication of two letters written in 1872 and 1873 by Prince BISMARCK to the EMPEROR, which certainly show that Prince BISMARCK has long disliked and distrusted Count ARNIM, but do not show much more. What their publication was intended to show is not easy to say. Except to those who have a clue which the letters themselves do not afford they are very puzzling documents. In the first Prince BISMARCK reminds the EMPEROR that Count ARNIM was much distrusted by His MAJESTY. It is the EMPEROR who appears as convincing Prince BISMARCK, or almost convincing him, that Count ARNIM ought not to be at Paris. In the next letter everything is turned round, and the EMPEROR is reminded that Prince BISMARCK had always warned him against Count ARNIM. The change of tone might naturally suggest the supposition that, in the interval between the dates of the two letters, Prince BISMARCK had not found the EMPEROR'S memory as to his own prepossessions against Count ARNIM quite so lively and fresh as Prince BISMARCK had anticipated, and that it seemed more in accordance with the Imperial recollection that Prince BISMARCK had warned His MAJESTY against a person whom the EMPEROR regarded with a friendly eye. However this may be, there can be no doubt that the letters show that Prince BISMARCK'S eminent position enabled him to address his Sovereign with a complete absence of reserve; and that in the unsparing discharge of his duty, Prince BISMARCK saw no reason why he should not say what he pleased, and not only deal sharply with Count ARNIM, but make a painful reference to another friend of the EMPEROR whom death has long removed. Even in addressing his Sovereign Prince BISMARCK appears never to forget that he has got GABRIEL at his back.

There is one passage in Prince BISMARCK'S letters which has a peculiar interest for us in England. The PRINCE reminds the EMPEROR that at one time there had been a

notion of sending Count ARNIM as Ambassador to London, but that the project had been abandoned because it had been discovered, when the usual steps were taken to ascertain how the appointment would be received here, that Count ARNIM's appointment would be unwelcome, as it was thought that he was so unscrupulous in his departures from truth that no one could believe a word he said. If this merely means that, when Count ARNIM's appointment was being discussed, a German official here, guessing perhaps Prince BISMARCK's own sentiments, sent a report more or less adverse, no one need be astonished. But this is not what the passage would naturally be taken to mean. It would be supposed to imply that this was the opinion of the English Foreign Secretary, and that Lord GRANVILLE had not hesitated to express it. There is something very astonishing in this. Certainly no disposition existed in the Foreign Office at the time to criticize very rigorously any proposal made by Germany. Politeness in its highest and most cordial form was the order of the day between the representatives of the two countries. Count ARNIM belonged to the first society of Berlin, and was supposed to stand exceedingly well with his own Court. Lord GRANVILLE must have strangely forgotten his usual courtesy, and lost in a moment his habitual tact, when he ran the risk of giving very serious offence by making a grave personal imputation against a person whom the Emperor of GERMANY thought worthy of the dignified post of English Ambassador. Had Prince BISMARCK had the advantage of knowing Lord GRANVILLE as well as Englishmen know him, a suspicion must have crossed his mind that there had been some mistake in the information sent to Berlin. But even if this had not been the case, and Lord GRANVILLE had expressed the opinion about Count ARNIM which it is suggested that he expressed, we are at a loss to understand how Prince BISMARCK can think himself now entitled to communicate such an opinion to the world. Personal objections to proposed ambassadors are very delicate things. They must be made in complete confidence. They are only possible if those who know what is said never reveal what they know. If Lord GRANVILLE ever said that he doubted Count ARNIM's veracity, he can only have said this in the full belief that he was safe in making a statement of the most strictly confidential character. The free and friendly intercourse of the highest representatives of different Powers would be at an end if it could be supposed that references to the private character of individuals were going to be published in the newspapers. Even if Prince BISMARCK has not injured Count ARNIM by allowing it to be supposed that Lord GRANVILLE went to the extraordinary length of objecting to receive him on account of his want of veracity, while Lord GRANVILLE never said anything of the sort, still Prince BISMARCK has set a very bad precedent. He has violated a confidence which Lord GRANVILLE had every reason to believe sacred. This is an injury to the whole civilized world. It degrades diplomacy. It makes honourable men in high office doubt whether they can ever be safe. The course which Prince BISMARCK has now taken is one which on other occasions he has denounced with the utmost vigour, and it is much to be regretted that he has been hurried by personal pique and passion into doing what, if done by any one else, would have met with his sternest reprobation.

COUNT ANDRASSY'S NOTE.

THE publication in full of Count ANDRASSY'S Note proves the inaccuracy of the statements which had been made as to its substance and character. Having once for all verbally recognized the independent sovereignty of the SULTAN, the Austro-Hungarian CHANCELLOR proceeds, in the name of the three Imperial Courts, to dictate in peremptory language the methods of administration which are to be adopted in Herzegovina and Bosnia. The undisguised contempt which is expressed for the late reforming decree of the Porte has been hastily regarded as a proof that the document cannot have been issued in deference to the advice of the Russian Ambassador. It is possible that General IGNATIEFF may have intended both to subject the Turkish Government to humiliation, and to remind it that the most liberal concessions would not avert foreign interference. It has been reasonably objected that the firman purported to apply to the whole Empire, instead of simply providing for the redress of grievances in the disturbed provinces. The three allies might be accused of perpetrating a similar anomaly in extending their solicitude to Bosnia, which has hitherto for the most part remained at peace, while the insurrection has been almost entirely confined to Herzegovina; but they would perhaps reply with truth that of their earnestness there can be no reasonable doubt. Their profound distrust of the sincerity of the Porte is concealed by the most transparent veil of conventional courtesy. Count ANDRASSY more than once remarks that the Christian subjects of Turkey repose no confidence in the good faith or sincerity of the Government; nor is it even thought necessary to disclaim participation in their disbelief. It may be inferred that no laws or regulations will satisfy the exigency of the Imperial Courts. If Count ANDRASSY'S Note were adopted by the Porte and verbally reproduced in the form of a firman, the Turkish Government would in no degree have met the implied charges of perfidy or incapacity. If the accusation is well founded, Russia and Austria, and perhaps Germany, will after a short interval have to repeat their suggestions with an additional demand for satisfaction in respect of a breach of promise. On the other hand, it is possible that the evident imminence of foreign intervention may strengthen the hands of the Turkish Government in dealing with its Mussulman subjects. The more or less liberal decrees of the late and the present SULTAN are thought to have been disobeyed on the ground of their inconsistency with the precepts of the Koran; but superior force furnishes an excuse for disregard even of divine commands. Toleration of infidels ceases to be a crime when the alternative is the final establishment of infidel supremacy.

The main cause of the grievances which produced the present insurrection is the possession of the land by owners of a different creed from the majority of the population. The political and administrative oppression of the Christians arises partly from local antipathies, and perhaps principally from the belief in their own superiority which is common to Turks and to Slavonic Mahometans. The remedies proposed by Count ANDRASSY fail to reach the root of this evil. He could scarcely have recommended the expropriation of two-fifths of the inhabitants of Herzegovina; and for the present he only suggests the palliative of facilitating the acquisition by the Christians of waste lands which seem to be at the disposal of the Government. When the peasantry have become purchasers of petty freeholds, they may, according to Count ANDRASSY, use their discretion as to becoming or remaining tenants of their Mussulman neighbours. It is probable that, if the owners were driven to choose between the cultivation and the abandonment of their lands, they might often be disposed to sell them on easy terms. An indispensable part of any feasible scheme of reform of course consists in the admission of Christians to social and legal equality. It is not to be endured that their evidence should be rejected in courts of justice; and they are entitled to a real as well as a nominal voice in local administration. In matters of this kind the only peculiarity of the advice contained in the Note is that it is virtually a command. The interference of the three Governments in fiscal administration is more novel, and therefore more significant. Count ANDRASSY considers that the provinces have just cause of complaint in the remittance to Constantinople of the revenue arising from taxation. He requires that in future the whole proceeds of the direct taxes shall be applied to provincial purposes, while the Porte is still graciously allowed to profit by excise and other indirect imposts. Chambers of Agriculture and disappointed followers of Sir MASSEY LOPES may envy the relief which is to be afforded to the Herzegovinian ratepayer at the expense of the national revenue. Count ANDRASSY'S demand may possibly be equitable, though the reasons by which it is justified are not explained; but no part of his Note is so incompatible with the independence of the Turkish Government. The distinction between the purposes of direct and indirect taxation is entirely arbitrary; and the proposed rule would probably finally complete the insolvency of the Porte. English holders of Turkish bonds may possibly think that their own vested interests are as important as philanthropic measures for the benefit of Herzegovina. If the Porte accepts the Note without qualification it will have pledged itself to account to the Imperial Governments for the disposal of its revenues. It may be doubted whether any European State has established for

itself the fiscal distinction which is to be imposed on Turkey.

Disregard for diplomatic reserve is exhibited not only in recitals of that distrust of the Porte which is attributed to its Christian subjects, but in the intimation that the insurgents are about to profit by reinforcements or diversions. Count ANDRASSY has anticipated the many newspaper Correspondents who propagate hostility to Turkey in the announcement that Bulgaria and Crete are preparing for insurrection in the spring. The Greeks, whose aid would be regarded as indispensable by Cretan insurgents, will receive with surprise a prophecy which has an evident tendency to fulfil itself. It is less surprising that the Porte should be threatened with withdrawal of the restraint which has hitherto been imposed on Servia and Montenegro. It is not certain whether the authors of the Note were aware of the negotiations by which the Porte is now endeavouring to buy off the dangerous enmity of Montenegro. The Prince of MONTENEGRO and his subjects may congratulate themselves on their political adroitness, if their ambiguous conduct during the insurrection procures for them the coveted possession of a port on the Adriatic, as well as other desired extensions of territory. The concessions made by Turkey may perhaps be prudent, if any security can be obtained for future immunity from Montenegrin hostilities. All the reasons which are commonly assigned for rendering aid to kinsmen and coreligionists will remain in force notwithstanding any material advantages which may have been obtained by the Principality. The warlike tendencies of the population will scarcely be abated by a transaction which will have proved that it is profitable as well as praiseworthy to give assistance to neighbouring insurgents. If it is true that the Bulgarians and Cretans are preparing for revolt, it is difficult to understand why they should accept concessions to the Christians of Herzegovina and Bosnia as redress for any grievances of which they themselves complain. The implied encouragement to rebellion which is contained in Count ANDRASSY'S warning amounts to a reversal of the traditional policy of Austria. The last Cretan rebellion was only encouraged by Powers which were at that time entirely opposed to Austrian policy.

Impetuous sympathizers with the insurrection prematurely denounced Count ANDRASSY'S Note as nugatory, because it was known that his recommendations were not enforced by a definite menace of intervention. The substance and the tone of the communication supersede the necessity of a formal threat. The Note could only have been addressed to a Government which was required to obey on pain of the most serious consequences. Austria and Russia can have no possible right to dictate the application of Turkish revenues, unless they consider themselves at liberty to enforce the acceptance of their advice. The Porte will be required to submit to all the commands of its imperious neighbours, nor will negotiation on details be permitted. Resistance to superior force would be imprudent, though it might perhaps cause some embarrassment to the Imperial allies. The Austrians can at any time occupy Herzegovina and Bosnia; and probably their administration of the provinces would be for the moment the best solution of innumerable difficulties; but any measure of the kind would be practically irrevocable; and it would furnish a precedent for the further dismemberment of the Turkish Empire. It can only have been under a supposed pressure of necessity that Austria, which, as Count ANDRASSY lately said, is identified with England in policy and interest, can have concurred in the policy which has always been pursued by Russia. Probably neither Power favours the extension of Servian dominion, and Austria would regard with suspicion the aggrandizement of Montenegro, which acknowledges an informal Russian protectorate. The union of the three Imperial Governments, as long as it lasts, renders opposition to their measures practically impossible. France is for the time indisposed to an active policy, or perhaps is inclined to cultivate the good will both of Austria and of Russia. The protection which England has for a century accorded to Turkey has always been rendered on the assumption that Austria was opposed to Russian encroachments. The transfer of one or more Turkish provinces to Austrian dominion would not in itself have been regarded with disfavour. It is still probable that, when circumstances change, the existing combination may be dissolved. As it was impossible, and perhaps undesirable, to defend the Porte, the English Government judged wisely in not encouraging resistance. The Porte, which at once submitted to the demands of the three Powers, would have been embarrassed by an intimation that, in the opinion of England, the required concessions were excessive in themselves or inconsistent with the dignity of the SULTAN. It may perhaps have become impossible to adhere to the established policy of maintaining the independence of Turkey. If Austria continues to act in union with Russia, it will only remain to break or to disguise the fall of the Empire.

LANDED PROPRIETORS.

THE official list of landed proprietors will not put an end to the agitation against the present system of tenure; but it will render new arguments necessary. The 30,000 owners, half male and half female, recorded in the Census, who have so often offended Mr. MILL and Mr. BRIGHT, would, although their possessions were unequally divided, have averaged about 1,000 acres apiece. Their average is now reduced to 35 or 36 acres, although the great majority in number own nothing but a house and perhaps a strip of garden. Careful study of the Blue-book will probably show that the greater part of the land belongs to comparatively few proprietors. Until the statistics of personalty are collected with equal completeness, it will be impossible to know whether other kinds of property are more equally distributed. An examination of the share-registers of public Companies would probably exhibit a preponderance in value of the holdings of the larger capitalists; but there are reasons for much wider differences of amount in landed estates. A dividend warrant for 5*l.* is as conveniently received as one for 5,000*l.*, nor is it more liable to deductions. A man who sells a railway share, unless he uses the money for commercial or industrial purposes, will not find his income increased, except at the cost of additional risk, by an alternative investment; but almost any landed proprietor, large or small, has the power of becoming richer by sale of his estate. On the other hand, the universal appetite for land extends to no other form of property, with the exception, in some cases, of objects of art and luxury. There is no sentiment about interest on bonds or dividends on shares; and such securities are therefore bought and sold with exclusive regard to the income which they produce. The advocates of the division of land into small freeholds, even when they admit that large properties are more profitable, hold that a cultivator of the soil is happier and more independent when he is also the owner of his tenement. Some economists further contend that spade husbandry is more productive than farming on a large scale; but they are almost always deluded by the fallacy of reckoning gross returns of produce instead of net profits. There can be little doubt that corn and cattle are produced more cheaply on the large farms of England than in any part of the Continent. If farm-labourers were converted into small freeholders, two or three times the actual number would, as in France, be employed in raising the present amount of produce. The part of the population which is set at liberty from the land by cultivation on a large scale earns a much larger income than the same number of farm-labourers.

Estimates of the comparative economical advantage of different systems of land tenure by no means exhaust the question. If it were possible to convince a French peasant that large farms and large estates promote national wealth more effectually than petty freeholds, he would remain not less immutably attached to his fragmentary ownership of the soil. Nevertheless the subdivision of land in France is only maintained by the operation of positive law. The compulsory division of the land among the children of the former owner is a thoroughly artificial arrangement. One result in the cessation of growth of the rural population would be regarded as an evil, except by the school which holds the doctrines of MILL. The universal thrift of the peasantry is a mixed advantage. The experiment of education has not been fairly tried in French rural districts. When the mass of the population learn to read and write, and when some of them aspire to more complex studies, it is at least possible that the general attachment to the soil may be rapidly impaired. It is found in the Eastern States of the American Union that the descendants of former occupiers of land throng more and more into the towns. Ploughing and sowing are healthy occupations

which suffice for those who understand nothing else, but they tend to become monotonous and dull. A young Englishman who should deliberately devote his life to the cultivation of fifteen or twenty acres of his own would provide for himself a dismal career. As long as his case is exceptional, he may easily add to his income by working for others; but if the greater part of the country were divided into little freeholds, there would seldom be a demand for hired labour. With a neighbouring proprietor ready to give him perhaps 1,000*l.* for his property, the occupier of his own land would practise singular self-denial if he persisted in living on the produce. For another class, and especially for tradesmen and mechanics, small holdings of land are highly desirable. It is a great advantage when freeholds are comparatively easy to be obtained in the neighbourhood of small towns and villages; and small capitalists who can afford to indulge their tastes not unfrequently outbid large proprietors; yet it would scarcely be practicable to establish varying systems of land tenure in different parts of the country.

The operations of Building Societies and similar organizations during the last twenty years probably account for a considerable portion of the 900,000 properties in the Blue-book. The same machinery would have been applied to the purchase of small agricultural freeholds if there had been a genuine demand for the means of peasant cultivation. The occasional purchase of their own farms by rich tenants would, even if the practice were more general, produce no permanent change in the distribution of property. For one or two generations the race of comfortable yeomen may last; but the numerous children of English households require provision, and it is difficult to maintain the practice of primogeniture on an estate of three or four hundred acres. The alternative of splitting up the farm into fragments would involve great waste of money in the erection of new buildings; and in the majority of cases it would greatly diminish the value of the land. The tenantry who from time to time betray jealousy of the landlords may be well assured that large farms will not survive the subdivision of large estates. Except for a large proprietor or for a landowner who has other sources of income, the permanent investment of the greater part of a man's property at 2½ or 3 per cent. involves an exercise of self-denial. It is not surprising that the happy recipient of annual thousands should prefer a comparatively unremunerative investment which gives him the greatest possible amount of pleasure in addition to a sufficient income.

The returns will throw no light on the only controversy relating to land which has for the moment any practical importance. The tenant-farmers have, without any extraordinary exercise of sagacity, discovered that the Ballot has transferred to their class the control of the county representation. Their late victory in North Shropshire is likely to encourage them in future contests; and the enthusiasm which was expressed for Mr. READ on his retirement from office proves that the tenantry are not indisposed to mutiny against the Conservative party. Only a few of their number will trace the connexion between the actual distribution of property and the custom of occupation; but the advantage of increased security of tenure, and of a larger share in the profits and conveniences connected with land, is readily discerned. No official statistics were needed to inform the farmers that they have for the present no reason to fear the multiplication of small freeholds: but their most formidable adversaries in the future are not the owners of the land. It would be difficult to ensure a sufficient supply of hired labour if small holdings became numerous. The remedy which Count ANDRASSY urges on the Porte for the discontent of the labouring class in Bosnia is not yet proposed in England. The Blue-book will be more interesting to social reformers who are in the habit of discussing the abstract right by which property in land may be held, but the stability of titles is likely for some time to remain exempt from practical dispute. The great inequality of landed estates, though it is not now disclosed for the first time, will be used as an argument in favour of measures which might facilitate periodical dispersion of property. The class which has perhaps most to apprehend from changes in legislation consists of unborn children; but the principle of settlements will be defended by those who own property in land or in personalty, and they will resent the disturbance of their habits by speculative economists. Revolutionary proposals for dealing with land are not yet proposed in England; nor can they become formidable until agricultural labourers acquire political power to be manipulated by agitators.

M. GAMBETTA AND THE CHURCH.

THE usually sluggish course of French electioneering preparations has this week been varied by an important speech from M. GAMBETTA. He is a candidate for the representation of Lille, a city which has for him the special attraction of being associated with the resistance of the Army of the North under General FAIDHERBE, and on Sunday he addressed the electors for the first time. His speech is characterized by all the moderation which he has at length taught the French Radicals to expect from him, but it differs from most of those which have preceded it in containing a clear statement of his position on the ecclesiastical question. Considering how dominant this question is in the controversies of the time, it is creditable to M. GAMBETTA's dexterity that he should have been able to keep clear of it so long, and the reasons why he has been anxious to do so are easily to be divined from the speech itself. M. GAMBETTA has apparently conquered the tendency to misconceive and misrepresent his opinions which for so long a time has been ingrained in the moderate Conservatives of France. Perhaps the issue of the Senatorial elections has convinced them that, as M. GAMBETTA is certainly a man with whom they will have to reckon, he is also a man whom it may be worth taking some trouble to understand. At all events, to whatever it is to be attributed, there is a remarkable change of tone in the moderate Conservative organs as regards this particular speech. A year ago—even a month ago—it would have stood a good chance of being set down as a timely disclosure of the atheism and impiety which underlie M. GAMBETTA's assumed superiority to Radical passions. It would have been of little avail to talk about Church matters before a public which was sure to misunderstand him, because anything that he said would have been represented, first to, and then by, the French clergy as a direct outrage upon religion; and as the clergy have to a considerable extent the ears of the peasantry, the evil done by the speech at second hand might have been greater than any good that it might have done at first hand. Now that this systematic perversion of everything that comes from M GAMBETTA has apparently been abandoned, there is more chance that his words may be left to make their way unaccompanied by ecclesiastical glosses; and, when they are fairly considered, they will probably find favour with a good number of the country curés and with a still larger number of the peasantry. M. GAMBETTA introduces the ecclesiastical part of his speech by a definition of the word Liberal. By Liberal, he says, I understand a man who respects all varieties of religious belief, including their ministers and all the practices which spring naturally, even if remotely, from religious opinions. Such a man will not be disposed to tolerate encroachments by the ministers of any religion upon the domain of secular affairs. The Church must remain the Church, and not attempt to obtain Parliamentary influence. She must resign herself to her proper sphere of administering spiritual consolation to her members, and not interpose herself as a discordant and dividing influence between parent and child, or between husband and wife. It is this that has made the Church a political danger in so many countries, and has brought upon her attacks which are, after all, only reprisals. So long as the struggle between faith and reason, between science and revelation, is confined to books, to pulpits, and to academies, politicians, as such, have no concern with it; it is when it sits by the side of a Minister, and penetrates into the working of an office, that it becomes no better than a suppressed civil war.

M. GAMBETTA's view of the position of the Church in the State must be compared with the views of the Extreme Radicals before its significance can be rightly appreciated. There is all the difference between him and them that there is between Mr. BRIGHT and Mr. BRADLAUGH. The Radicals who have lately been plying the Paris candidates with questions, shrieking against the black coats, and denouncing the wickedness of being married in church, must be as much shocked at M. GAMBETTA's language as at anything that could be said by M. VEUILLOT. To talk of regarding religion or the ministers or practices of

religion with respect is, in their estimation, a compromise too mean and too immoral to deceive a single honest man. To them religion has no proper place; she is equally to be hated in the spiritual and in the temporal sphere. It is nonsense therefore to talk of confining her within specific limits; from a properly constituted society she must be altogether and definitively banished. This is the sort of language which Frenchmen have been accustomed to associate with Radicalism; and when they hear of the very different language used by M. Gambetta, it is likely to give him a new title to their confidence. There is no reason to believe that the peasantry of France are in the least priest-ridden; on the contrary, they are exceedingly jealous of any trespass on the part of the priest upon matters which they regard as specially their own. And even the less distinguished curés have probably some sense that the association of the Church with politics has been a fruitful source of the distrust with which their ministrations are often received. They are supposed to be political agents even when they are not really concerning themselves with politics, and the unpopularity which attaches to them in this capacity often extends to them in their purely spiritual capacity. To a man who is really acting as a political agent, the hope of serving the cause he wishes to see triumph may be a sufficient consolation for losing the confidence and goodwill of his parishioners; but to a man who is not a political agent, and who merely enjoys the reflected discredit of being one, the loss remains wholly unbalanced. He would be quite satisfied, if left to himself, to let the world go its own way and to make the spiritual needs of his people the sole object of his labours. It is hard that he should be prevented from doing this by the determination of his more ambitious brethren to take the world in hand and convert the Church into a powerful political influence. When men of this type hear that the leader of the Left professes his respect for the beliefs, the ministers, the practices of religion, and only dislikes the identification of religion or its ministers with politics, they will not feel under any very strong inducement to push the prospects of some Conservative candidate who may adjure them to resist M. Gambetta and his party as they would resist the Devil himself.

M. Gambetta's attack upon the liberty of University education was not worthy of the rational statesmanship he has lately sought to display. If the clergy are to remain dissociated from politics, politicians must take care not to deny them their just rights. Otherwise they will come into the political sphere to regain them, and once there, they may not be so willing to retire. It is unreasonable to expect that French Catholics would for ever remain content with a University system which committed the whole higher education of the country to the State. Upon any theory of Liberalism parents have a right to bring up their children in any system of religion or philosophy that they may choose, and we cannot see why they should be forbidden to delegate this power to others. M. Gambetta would not forbid a father to teach his son that the sun goes round the earth, but he is distressed at the notion of this same parent sending this same son to a college which teaches that the sun goes round the earth. Perhaps he will say that it is not the teaching he objects to so much as the claim put forward on behalf of the Church to have this theory stamped with the State seal, and put in all respects on a level with the more accurate, though less orthodox, theory. No doubt, if the State were compelled to give degrees to men who passed an examination in either kind of astronomy, M. Gambetta's dislike of the law would be perfectly reasonable. But, as a matter of fact, the difficulty is always evaded in one of three ways. Either University degrees are conferred by a mixed Board, in which case the theory of the earth's motion is sure to be recognized; or the orthodox University is allowed to confer degrees of its own, and so no one is deceived, because it is known that an orthodox degree means that a man has been brought up in the belief that it is the sun that moves, and not the earth; or the subject is excluded from the examination, and then those callings which require astronomical accuracy institute a special examination in astronomy. All these ways are open to cavil, but any one of them seems to be better than a system which does its best to isolate the orthodox student, and so to shut him out from that amount of knowledge on other subjects which those who have the charge of him are willing that he should obtain. The most extreme conceivable instance has purposely been chosen in order to show that the case of the opponents of freedom of the higher education breaks down even when Ultramontanism has been allowed to do its worst. Even if the Ultramontane student were taught to renounce the doctrine of Galileo, we should still say that it is better for him to be taught to renounce it at a University than in some local seminary. If he remains ill taught on this one point he may still be well taught upon others, and the mere fact that he is brought into relation with the triumphs of human knowledge in certain departments will be likely in some degree to excite his curiosity to know what it has done in the forbidden department. The hostility which French and Irish Liberals bear to freedom of University education seems to be the offspring of a distrust of that very learning which they wish to extend. Instead of feeling that an educated Ultramontane is at all events better than an ignorant Ultramontane, they seem to fear that the more an Ultramontane knows, the more dangerous he will become. This view would be intelligible if it were preached by Ultramontanes themselves. But to declare that the only way of rendering your adversary harmless is to keep him ignorant involves a strange misconception of the influence of education. The details of the French law which concedes freedom of University education may be faulty enough, but the principle on which it is based is more really liberal than the opposite principle maintained by M. Gambetta. Still the fact that he does not apply the common sense which characterizes other parts of his speech to the subject of the higher education does not destroy the importance of a change which, almost for the first time in later French history, exhibits Radicalism and moderation in conjunction upon the question of religion.

THE COST OF EDUCATION.

THE announcement that the expenditure of the London School Board for 1870 will necessitate a rate of 4½*d* in the pound, coupled with the reasonable suspicion that even this sum may fall short of the actual outlay of the year, will excite a natural uneasiness in the minds of the ratepayers. It is clear that to bring elementary education within the reach of every child is a more costly process than was at first expected. Before the passing of the Education Act, zealous educationists naturally tried to make us little as they could of the burden, while those who were not zealous educationists did not know the statistics of the question well enough to have any opinion about it. Three unforeseen sources of expense have been discovered since that time. First, there is the inevitable overlapping of voluntary and Board schools in large towns, and most of all in London. In country parishes it is easy to ascertain whether sufficient accommodation for every child is already provided in voluntary schools; and, where this is the case, things go on much as they would have gone on if the Education Act had never been passed. But in London, where it is known beforehand that the voluntary schools are altogether inadequate to the educational needs of the population, and a corresponding vigour of effort is expected from the School Board, it is plainly impossible to calculate with any nicety how many children are already provided for and how many remain to be provided for. Possibly the London School Board may not in all cases have been careful enough to ascertain whether schools were wanted before determining to build them. But, even if they had exercised all possible caution in this respect, they could not have helped building some schools which, as things have turned out, are not absolutely required. Another element of increased expense is the advanced conception of elementary education which is a necessary result of the position which the controversy has taken. It is impossible to turn elementary education into a great political battle-field without making each party maintain that they have a higher idea of education than their adversary. The secularist taunts the Churchman with being indifferent to the children's progress, provided only that they can say the Catechism by rote. The Churchman retorts on the secularist that the beggarly elements of secular knowledge as taught in Board schools do not even supply that intellectual learning to which the religion of the children is sacrificed. Consequently both parties are anxious to make the list of subjects taught in their schools as complete as possible, and the more subjects are taught, the

better qualified must be the teachers that teach them. A third element of increased expense is the rise in the value of teachers consequent on the increased demand for them. Not only are more teachers wanted, not only must the teachers be themselves better educated, and therefore able to ask better terms, but the ordinary teacher of five years ago is no longer to be had at the price of five years ago. Schools have increased at a rate with which the increase of teachers has not kept pace. None of these items of expense are likely to grow less as years go on; or, if the last should happen to decrease, it will probably be balanced by a further increase in one or both of the other two.

This consideration will perhaps have weight both with Parliament and with the Government in determining the character and fate of the various Education Bills which will be introduced this Session. For example, Mr. DIXON will have some good stiff work cut out for him if he wishes to prove that the ratepayers will be better off if School Boards are universally established. The ideas of a School Board and of a school are not inseparable, but they are very closely allied; and it is not likely that, if they were set up in every parish, they would all be content to do nothing beyond passing by-laws to help the parson in filling the Church school. The advocates of free schools will be equally at a loss to justify their rejection of school fees. It must cost considerably more to teach a child for five years who never pays a farthing all that time than to teach a child for the same period who never fails to produce his threepence every Monday morning. It will be a matter of some interest to see how Mr. DIXON meets this objection. An array of free Board schools rising up in every direction side by side with voluntary schools may rejoice the hearts of educationists, but it will make an equally forcible appeal to the pockets of the ratepayers. What, for example, would the education rate amount to in London if there were no voluntary schools and no school fees? Even if we concede that under these circumstances the education given to the children would be very much better than it is, and consequently that the ultimate gain to the community in the shape of diminished Poor rates and fewer prisons would more than counterbalance the loss in the shape of an increased Education rate, would it be prudent to submit the issue to the ratepayers until they have been trained to submit to present outlay in consideration of future returns? If the outlay is suddenly imposed on them before they have mastered this lesson, there is reason to fear that, in the reaction against extravagant expenditure, much that is included in strictly reasonable expenditure would be swept away. There is so much remaining to be done which must entail further expenditure that it seems imprudent to quarrel with any agency that is really doing good work, even though it may not be doing it in the best conceivable way. Of course there must be a limit to this endurance, as in the case of Ragged Schools. When a certain end has to be attained, it is not wise to be particular about the uniformity of the means taken to attain it, provided that they all have the essential quality of bringing those who adopt them to the common goal. If they fail to answer this definition they have no claim to be considered as means to that particular end. When Lord SHAFTESBURY defends Ragged Schools on the plea that, though they do not give the education which Parliament has determined shall be brought within the reach of every child, they give something which is much more valuable, he puts himself out of court. He may be right in thinking that the Ragged School managers know their business better than Parliament, but this does not alter the fact that the function of Parliament is to make laws, and the function of school managers to obey them. When, however, the Ragged School managers tacitly withdraw this pretension, and only ask for time in which to make their schools efficient, the situation is entirely changed. No one except an inveterate formalist denies that they have played, and are capable of still playing, a very useful part in the machinery of education; and provided that they will not insist on resting satisfied with a lower standard of education than is demanded of other schools, no one desires to injure or annoy them. Schools which to a considerable extent feed and clothe the children attending them must have means of inducing, if not of enforcing, attendance which are wanting to schools which only give education; and in proportion as attendance becomes regular the difficulty of bringing children up to the prescribed standard will probably disappear.

The lesson of the London Education rate may also be commended to the Government. The mention of primary education in the QUEEN'S Speech seems to indicate that there is something more in store than a mere alteration of the conditions under which the Parliamentary grant is distributed, and Mr. CROSS's views about compulsion give some ground for hope that a further advance in this direction is in contemplation. Certainly the more costly education becomes the more important it is that none of the money spent on it should be wasted. If we have every year to pay more money for teaching, let us at least make short work with the mischiefs which are alleged to flow from children not being taught. Even the loss on the school fees of the absentees is not to be altogether despised. It costs as much to provide school accommodation for five hundred children who play truant as for five hundred children who attend regularly; but the return of the children's payments in the two cases presents a very different aspect. There is no necessary association between compulsion and School Board schools; indeed, the more thoroughly the attendance of children is enforced the more it will be expedient to leave parents free to choose the schools which they wish their children to attend. The failure of the Agricultural Children's Act to answer the purpose which its well-meaning framers designed it to answer has been too unmistakable to leave any doubt as to the uselessness of indirect compulsion, unless it is accompanied by a very complete, and consequently very costly, system of inspection; and even if this were provided, it would not touch the cases of children who are kept at home for the sake of their work or their pleasure, instead of for the sake of their wages. But, even if inspection would completely remedy the evil of non-attendance at school in agricultural districts, it would be a most short-sighted policy to have recourse to it. Compulsion brought to bear on the employer can only be a temporary substitute for compulsion brought to bear on the parent. After all, it is the parent's business to see that his child is properly brought up, while, except in a very general sense indeed, it is not the employer's business. If the promised measure of the Government ignores this obvious but fundamental distinction, and proposes to spend money on making the Agricultural Children's Act efficient, the work will certainly have to be done over again by and by.

THE SOUTH KENSINGTON BREAKDOWN.

THE fact that certain notorious enterprises at South Kensington, which had their origin in the surplus of the Great Exhibition of 1851, are at the present moment in a condition of hopeless financial collapse, would not be in itself a matter of much consequence if it affected only those who are immediately interested in these unfortunate projects. It happens, however, that a large sum of public money has thus been grossly misapplied, and that the Royal Commissioners, who are to a certain extent responsible for this discreditable result, were appointed to act on behalf, not of private speculators, but of the community at large. It would seem, therefore, that the time has come when the Royal Commissioners should be called upon to render an account of the funds entrusted to them, and that the truth with regard to the various South Kensington Exhibitions should no longer be concealed with the connivance of the Government. The Duke of EDINBURGH remarked the other day in reference to a sham Aquarium at Westminster, which has turned out to be merely a drinking-bar in disguise, that this precious institution was "a natural result" of the PRINCE CONSORT'S benevolent projects; but those who have any genuine respect for the PRINCE'S memory will probably hesitate to believe that he contemplated the results which have actually been produced, and will be disposed to think that the persons who are responsible for these results have formed a very imperfect appreciation of the objects which he had in view. It was arranged that the profits realized by the first Great Exhibition should be applied to promote the general advancement of science and art; but it appears that the greater part of the fund has been bestowed on such projects as the Horticultural Gardens and the Albert Hall, and no one can pretend that science or art has profited by such an application of the money. The Horticultural Society has long ago abandoned even the pretence of doing anything for horticulture in its scientific aspects, and the Gardens have become a mere pleasure-ground for the use of

neighbouring residents. As for the Albert Hall, it has never served, or attempted to serve, any purpose beyond that of competing in the ordinary way with the other concert-rooms and music-halls which are kept up by private enterprise; and it is difficult to see why it should be supported out of public funds. At the present moment both the Horticultural Society and the proprietors of the Albert Hall have absorbed a large part of the Royal Commissioners' resources, and are making no return. Indeed they are both in such a desperate condition that they are endeavouring to break the bargains which were originally made with their subscribers, and to compel the latter to pay over again for privileges which have become a wretched mockery. The Horticultural Society, which is supposed to be managed by noblemen and gentlemen of high position, has fallen so low, both in purse and conscience, that it has actually defrauded the poor gardeners of the prize-money by the promise of which they were deluded into sending contributions to flower-shows which were profitable to the Society. The meeting of Fellows on Thursday is described by the reporters as, "if not of a discordant, of a very inharmonious character"; and Lord ABERDARE, in taking the chair, remarked that "in the present state of feeling amongst the Fellows" it would be impossible for him to go into past events. It seems that the Society is at such a low ebb that its *Journal* has been discontinued, and it has now to depend for "a medium of communication between the Fellows" on the charity of the newspapers. Moreover, the prize-list has been cut down to a merely nominal amount. The last resource of this distinguished body is now, it would appear, to stake its fortunes on a skating-rink, which must be admitted to be a very curious method of promoting science and art.

Under these circumstances, it is evident that the Horticultural Society and the Albert Hall are in possession of public property on false pretences. It is stated that the Horticultural Society holds ground from the Royal Commissioners valued at more than 100,000*l.*, and that it is now heavily in debt to the Commissioners for unpaid rent. The financial position of the Albert Hall is at present surrounded with greater mystery; but it is clear that it is financially in a very bad way, since it has avowed its design of asking Parliamentary sanction for a plan of levying a new tax on the unfortunate victims who have already purchased useless boxes and stalls at a high figure. If these enterprises had been carried out by the private speculators who are at the bottom of them in their own names, they would no doubt have been wound up long ago, and it is only by trading in a despicable manner on a respected memory, and obtaining the use of public money on empty pretexts, that they have been enabled to prolong a scandalous existence. It is only just that, as far as possible, the public property which has thus been misapplied should be recovered for the use of the nation in some honest and respectable way, and that the cover of a Royal Commission should be stripped from institutions which would then be exposed in their true colours. Whatever may have been the original intention with which the South Kensington estate was taken up by the Commissioners, there can be no doubt that their management of it has practically taken the form of a mere building speculation. Whether it will prove to be for the public convenience that the natural history collections should be removed from the centre of the town to this remote suburb remains to be seen; but it can readily be understood that the scheme of concentrating museums and pleasure-grounds on this spot is highly acceptable to the owners of house property in the neighbourhood, and this is the only class which has profited by the large expenditure which, by a gross abuse of authority, has been diverted from the true objects to which it was dedicated. It would be interesting to know what form of science or art is supposed to have been promoted by the gimcrack mansions of South Kensington. In a town which grows so rapidly as London it is always a pity that any piece of open ground should be swallowed up, and there might be reason to regret the conversion of the Horticultural Gardens into streets and squares. It is clear, however, that, whatever is to happen, the Horticultural Society has forfeited its right to the continued possession of this property, by its flagrant abandonment of the purposes for which it was pretended to be established. Some arrangement might perhaps be made between the Commissioners and the householders of the district for a lease of the ground; but in any case public money ought not to be applied to purposes of merely local convenience. The National School of Music is another offshoot of the same rank soil as that which has nourished the other fungi. It enjoys distinguished patronage, and bears the usual delusive trade-mark of science and art; but it should not be forgotten that it practically involves an attack on an older institution which, in the face of many difficulties, has done service of the highest value in the cultivation of musical taste and skill, and which an attempt is now being made to supersede, in order to provide further accommodation for the omnivorous COLE family, and a platform for the display of pushing professionals and distinguished patrons in search of a popular reputation. There seems to be something in the atmosphere of this district which covers the institutions springing from its soil with a thick coating of parasitical incrustations. It is the great nursing-ground of jobbery and humbug. From the early days of the Brompton Boilers a claptrap parade of enthusiasm for the promotion of science and art has been systematically kept up, with a view to diverting public money and patronage to this quarter for the benefit of an interested clique; and for the credit of public administration it is necessary that the abortive speculations which have resulted from this system should be cleared away. There might be no harm in such exhibitions if their character as commercial enterprises were candidly announced; but it is a scandal that such a system of mismanagement and imposture should be placed in any degree to the credit of public administration.

AFFECTATION.

ALL epithets which commonly imply the existence of a feeling of slight approval or disapproval in the speaker's mind for the thing named are apt to be used very vaguely, and the term "affected" is no exception to this rule. Some people seem to call anything in another "affected" which they dislike, just as they term anything "nice" which they happen to like. Still even the most foggy minds probably attach some dim connotation to the term affectation, while by some few persons it is always used with a fairly distinct apprehension of its correct meaning. Hence it does not seem to be a hopeless task to attempt to define the term a little more exactly, and to find where its peculiar value as an ingredient of a well-sorted vocabulary really lies. In making this attempt we must obviously have recourse to the Socratic method of definition by an induction of various examples of the well-recognized application of the term.

Affectation is most commonly employed in reference to the details of external behaviour. To take a familiar instance, any trick of bodily gait or of manual or facial movement may be deemed affected. A man may have an affected way of bringing his forefinger to the side of his nose after the foreign manner, or a lady may have a way of seeming to relieve her trachea from some irritant by a characteristic "hm," which strikes us as being affected; or again a young girl may appear to be affected when she gives herself a certain dignity of deportment. Some people are able to keep up an affected condition of behaviour for a considerable period. Thus we know ladies who regularly assume and maintain a curiously unnatural tone of voice when entertaining their male visitors. In such a case as this it obviously requires intimate knowledge and close observation to discover the affectation. In these instances, and in many others resembling them, we call an action affected because it springs from a deliberate wish to impress another person, instead of from some unreflecting impulse or mechanical habit. With respect to polite behaviour, it may be added that we look for a certain fixed habit of courtesy in people, and do not, for example, call a lady affected who uniformly adopts a gracious manner to her guests. So that what we mean by an affectation of elegance in behaviour is the conscious endeavour to assume something which does not flow easily from the fixed sources of habit. It follows from this that affected behaviour is very frequently a conscious imitation of something foreign to the person, more especially of something a little above his reach. Children's amusing affectations always show themselves as rather too obvious attempts to don the pretty manners of their elders. Imitation passes into affectation as soon as it becomes a conscious process, and this change seems to take place very early in the child's development. Affectation in adults as well as in children owes much of its ludicrousness to a conscious imitation of the words and actions of a superior age or social rank. It is this simple type of affectation which has so often been ridiculed in fable.

Another department of human life which offers a good field for the discovery of affectation is the region of emotional expression. When, for instance, a child or an adult expresses admiration of some spectacle by a long chain of extravagant superlatives and absurd images, we call the language exaggerated and affected. The expression is felt to be out of proportion to the feeling to be expressed. Again, a person may go on urging, so to speak, the presence of a

certain emotion on his hearer long after the feeling has had time to relieve itself. A lady is expressing her regret at some little inconsiderateness, and, instead of making her apology in a few words, continues to reiterate her assurance of vexation, much to her companion's discomfort. Another common form of this affectation of sentiment is the habit of flowing over into feeling on every possible occasion. Some men and women seem to affect, for instance, an extraordinary degree of risibility, since the least provocative—something quite microscopic perhaps to others—sends them into long fits of explosive laughter. Then there are the young women who seem to be afflicted with a plethora of æsthetic sentiment, and are for ever breaking forth into gushing rhapsodies over the scenery last visited and the works of art last inspected. Judging by the ordinary standard of human nature, we are unable to believe in these excessive effusions of sentiment. What strikes one as most significant of affectation in these sentimental persons is that they appear to be equally excited by the most powerful and by the most insignificant stimulants. The very funny youth who sees a comical element in all kinds of things laughs just as uproariously and persistently at what seems the merest trifle as at something which others are able to recognize as really ludicrous. In all these instances the affectation lies in a suspected forcing of a feeling beyond its natural bounds by an act of deliberate volition. It is the doing with a conscious purpose a thing which we expect to be done instinctively by the mere force of feeling itself.

A case of affectation in sentiment which at first sight looks very different from those just specified is that of a person who does not so much seek to increase the visible dimensions of a feeling as abstain from checking a feeling within becoming bounds. Thus we are apt to call a lady affected who makes no visible effort to subdue a feeling of trepidation, or of a fastidious aversion at the sight, or even mention, of certain harmless little creatures. So, too, we call a young woman affected who apparently makes no effort to overcome her natural bashfulness in the presence of strangers. Whenever the term is carefully employed in reference to these cases, it seems to connote a positive as well as a negative element of volition. For we invariably suspect that the person would control the feeling but for a lurking wish to display as much sensibility or sentiment as possible. It is this latent intention to appear sensitive which really justifies the use of the epithet in such an instance; for, strictly speaking, we employ it incorrectly if we imply merely a moral weakness of will. And so we find that in these examples also the essence of affectation is the substitution of a conscious purpose for an instinctive process. The sentiment is deliberately nursed, so to speak, by an artificial expansion of its external expression.

It is to be observed that there seems to be a well-recognized distinction between affectation and hypocrisy in the expression of sentiment. If the hollow profession of sentiment is likely to deceive, and also to injure by misleading, we scarcely speak of it as an affectation, but apply to it some stronger term of opprobrium. Moreover, though we are accustomed to regard as affectations mere exaggerations in the expression of certain feelings, such as those we have been describing, we should sometimes speak of a wholly illusory profession of the same sentiment as insincere or false. If a lady is rather too voluble in the expression of her regrets, she is said to be affected; if we have reason to believe that she feels no regret at all, we rather call her hypocritical. This shows that the term affectation, as applied to feeling, implies only a slight or harmless kind of simulation—a petty species of pretence which is rather comical from its patent hollowness, as well as from the silliness and vanity of its motive, than morally reprehensible. It is also worth noting, perhaps, that in the case of sentiment, as in that of mere external behaviour, we recognize such a thing as second nature—that is, a fixed habit of expressing a feeling on a certain occasion without any reflection at the moment. The rules of a rigid courtesy demand, for example, that we should always manifest a certain friendly interest in anything which our guest happens to be talking to us about; and so long as we do not exceed this quantity we are not likely to be accused of affectation. On the other hand, if we lay ourselves out to be specially sympathetic towards a person with whom we really have no particular interests in common, our conduct is rightly said to be affected; unless indeed it has some ulterior purpose besides that of simply making an impression on our guest's mind, in which case it will probably be characterized by some stronger epithet.

We may now pass to the second great region of affectation, that of literary and artistic style. When we accuse a writer of having an affected mannerism, we clearly liken him to those who show themselves affected in personal behaviour and in the profession of sentiment. The clearest case of affectation in art is where there is conscious imitation of another's manner. The usual form which this naturally takes is an attempt to array oneself in the fine plumage of more brilliant birds. The group of young aspirant poets and poetesses who uniformly follow in the wake of a leading popular poet, eagerly catching at all his peculiarities of manner, are rightly said to be affected. There is of course a vast deal of unconscious imitation of style in art, and it would be absurd to term every musician, for example, affected who instinctively follows some one model of style. Where the imitation is seen to arise from a natural affinity of mind, it is not said to be affected. Not only so, even conscious imitation of style does not always amount to affectation. It is unreasonable to expect that every writer should always abstain from introducing an echo of some previous master's melody. The field of perfect originality in art is not large enough to allow us to make such a demand. If only the selection of the particular model is seen to be made with an intelligent purpose, from a conviction that the manner selected is most suitable for the object in hand, it has nothing unseemly. In short, only such imitation of another's style is affected as is consciously executed, and, moreover, springs from mere mental impotence and a silly propensity to try to appear more than one really is. The style of a writer or a painter may, however, be affected without being imitative. Just as an original eccentricity of behaviour becomes affected as soon as it is studied, so oddities of artistic manner grow into affectations when consciously cultivated for their own sake, and without any reference to their fitness or utility. Hence it is sometimes permissible to call an eccentricity of literary manner affected after it has been distinctly brought before the author's notice by adverse criticisms, though before this it may have been a wholly unconscious habit of mind. Nobody, for instance, can doubt that some of the later uncouthnesses of Mr. Carlyle and Mr. Browning are correctly styled affectations. It is absurd to suppose that a writer can be wholly unconscious of mannerisms which have frequently been thrust as it were under his very eyes; and when one sees an author persevering in such eccentricities after these criticisms with rather more energy than before, and in cases where no other eye than his own, however kindly, can discover any advantage in their employment, it seems a fairly safe inference that the writer is obstinately affected. Yet it is no less clear that it is always more or less hazardous to predicate this quality of any man's style. For, after all, a man may bring himself to believe that his favourite mannerism is not only useful but essential to his art. In speaking, then, of artistic style as affected, we assume that the selection of all details of style should be a half-unconscious process guided only by the exigencies of the subject in hand. This idea is clearly indicated in the common expression, "naturalness of style." A literary style is natural when it springs from the author's individual nature, and is directed exclusively to the best expression of the idea of the moment. It is artificial and affected when it is made a distinct object of pursuit for its own sake, whether it be the original product of the person who uses it or consciously borrowed from another. So that, in this class of cases also, affectation connotes the presence of consciousness and deliberate volition with respect to a thing which ought, so to speak, to take care of itself by means of an instinctive or mechanical process.

In the affectations of art as well as in those of social life we may see the distinction between a comparatively harmless and a culpably insincere profession. Thus with respect to artistic imitation we draw a sharp line between affectation, or the adoption of another's style, and plagiarism, or the adoption of another's ideas. The latter term conveys a grave accusation of intellectual dishonesty, while the former is only in a very slight degree condemnatory. This difference is probably explained by the consideration that the borrowing of ideas is never, like the borrowing of style, to be excused on the ground of the limitation of the individual mind, for nobody has any business to write who has no ideas of his own to convey; also that the filching of an author's ideas is much more likely to impose on readers, and far more difficult to detect, than the adoption of an element of his style which lies patent, diffused, so to speak, over the whole surface of his writings.

We conclude, therefore, that the term affected has only a very slight amount of ethical force. In some cases it does no doubt imply the presence of some amount of falsification or simulation, but this is not of a serious character calling for stern disapprobation. On the other hand, people certainly do very often mean to express their strong dislike by this word, and we may reasonably infer that, as employed by the more refined and discerning, it strikes, so to speak, at a certain quality of deformity in the behaviour or action so described. In other words, an affectation is something which offends our æsthetic sentiment. This inference is fully borne out by a consideration of the essential qualities of affected actions. We have seen that they are such as possess a certain unnaturalness, being the result of conscious study and voluntary endeavour, instead of the spontaneous outflow of native or acquired disposition. The æsthetic charm of a good deal of human action resides in its unconsciousness. A man whose every action was directed by deliberate purpose and reflection would be intensely wearisome to the æsthetic eye, which loves before all other things in human character and conduct spontaneity and ease. There is, too, in all affected conduct a further repulsiveness which is connected with a recognition of illusion and pretence. Contradiction is always unsightly, and the deliberate simulation of a natural quality strikes us as an æsthetic dissonance. At the same time there are many examples of affectation which do not so much displease our sense of fitness and harmony as awaken our feeling for the ludicrous. This holds good especially of all the attempts of people to robe themselves in the unsuitable manners of their superiors. Of course this interpretation applies only to the term as employed with a certain degree of precision by thoughtful persons. Unfortunately, however, these are very few, and the greater number of people who use the term do so in the most slovenly manner. It naturally follows that these same people are utterly careless in making sure that the persons they thus vaguely characterize have the quality attributed to them. It will be seen from what we have said that it is often a matter of great delicacy of insight to decide whether a particular ingredient of a man's behaviour or an oddity of style is really an affectation.

THE FIRST DAY IN THE HOUSE OF COMMONS.

IT is natural that when the Sovereign appears in person at the opening of Parliament attention should be chiefly concentrated on the more gorgeous Chamber in which the pageant is enacted. And yet the House of Commons is perhaps, in its way, an equally curious, if less dazzling, object of contemplation. The usual contrast between the sober, work-a-day look of the Lower House and the elaborate grandeur of the Upper is of course heightened on such an occasion. The House of Lords is in its fullest splendour. The throne is uncovered, and the whole area flooded with rainbow tints—peers in red cloaks, diplomatists in uniforms and stars, great ladies in velvet, diamonds, and feathers, entering into a bewildering chromatic competition with the blazoned windows and gilded roof. The Usher of the Black Rod and his servitors are in the ascendant, the company is marshalled with courtly propriety, and ceremony and precedence are enforced. When we pass from this spectacle of pomp and ordered state to the House of Commons we enter upon a very different scene. The House itself has that sort of blinking appearance which reminds one of a theatre by daylight when the actors are lounging about waiting for rehearsal, and when everything and everybody has an air of undress. It is barely noon, but there is already a throng of members in the House, some trying the familiar seats, with possibly premonitory symptoms of the weary aches of much sitting later on, but, for the most part, standing about as long as they can, like railway travellers who stretch their legs before they are shut into their compartments. There is a loud buzz of gossiping, broken by occasional bursts of laughter, as the funny men make their way from point to point; and it will be observed that all have their hats on, as if in the street, although, in compliance with a superstition which is too strong even for the coldest day, their overcoats have been hung on the pegs which line St. Stephen's cloister. There is no Speaker as yet, and the gathering is therefore only a casual mob under the care of the doorkeeper. Even, however, when the Speaker comes, the House is only half a House until the Queen's Speech has been read. Prayers, indeed, are read, and places secured, but till the Royal messenger comes the Speaker is not entitled to ascend his elevated chair, but must sit at the clerk's table in a private, informal way. Unless impelled by their own curiosity, there seems to be no reason why members should attend on this occasion at all. There is nothing more characteristic of the loose, casual growth of great constitutional arrangements in this country than the manner in which a House of Commons comes together at the opening of Parliament, as if it were merely a fortuitous concourse of atoms. No official notice is sent to the members that they are required to meet, nor is the time of meeting intimated to them in any form different from that in which other people learn these particulars—that is, from the columns of the newspapers. When the Sovereign reaches the House of Lords, the Royal commands are sent to the Commons to attend immediately in the other House; but, oddly enough, there is no preliminary summons to the Commons to assemble, and it is only by the accident of members reading the newspapers, or by the circulars emanating from their leaders, that they discover that on such a day, if they are at Westminster, they will some time or other hear a summons from the Usher of the Black Rod. As far as official forms are concerned, therefore, it might happen that when "the honourable House" was called upon to attend the Sovereign, there would be no House ready to attend. Such members of an existing Parliament, however, as may have turned up are capable of assuming a sufficiently vertebrate form, under the qualified presidency of the Speaker, to receive the Usher of the Black Rod when he knocks at the door, and to go in a body to the House of Lords. But in the case of a new Parliament even this rudimentary degree of organization does not exist; for there is then no Speaker at all, and the House without a Speaker is still only in its first jelly-fish stage, a flabby lump of almost inanimate matter. It is true, indeed, that the Chief Clerk at the table is on such occasions entitled to exercise a vague authority over the company; but he is not allowed to open his mouth, and, at the utmost, can only indicate by pointing or other gestures what he means. It is impossible to say what would occur if a dispute on a point of order happened to arise in the course of a debate on the election of Speaker. The Chief Clerk would then be dependent on his proficiency in the art of pantomime for conveying any opinion or instruction to the bewildered assembly, and the highest authorities are, we believe, in doubt whether he would be allowed to resort to anything so articulate as the deaf and dumb alphabet of the fingers. It is to be hoped that dexterity in dumb show is not omitted in the list of qualifications for a seat at the table of the House. It might even happen that the Clerk, in attempting to keep order, would himself commit some breach of discipline, such, for instance, as calling out a name, which the House would only not resent because it possessed no mouthpiece to express its resentment. It has never happened, in point of fact, that this extraordinary state of things has led to any serious practical inconvenience, but still it is a curious example of the anomalous character of an important part of the British Constitution.

The explanation of the omission of any specific official invitation or command to members of Parliament to meet at an appointed hour, beyond the general notification in the *Gazette*, may no doubt be traced to that traditional jealousy of the Commons themselves in regard to the authority of the Crown which prompts them to adhere to the rule that "the first day of every sitting, in every Parliament, some one Bill and no more, may be read a first reading for form's sake," before the House will enter upon the consideration of the Queen's Speech—that Bill being always one with the mysterious title of Clandestine Outlawries, of which no more is ever heard afterwards. The Sovereign is entitled to summon Parliament, but a command to members separately to come to Westminster might seem to imply a right to compel them to come. One difficulty would of course be, from whom the order to meet should emanate. The head of the Government and the leader of the Opposition send round circulars to those whom they consider their supporters, asking them to be present at the evening sitting; but in this respect the Premier and the leader of the Opposition are acting only as private members of the House, and their circulars do not apply to the opening of the Session, but only to the business to be done after the House has been duly constituted. The House itself, when opened, has of course a right to compel the attendance of members, when it thinks proper to do so, by the form known as "a call of the House," and this power has been repeatedly exercised, though seldom in modern days. Hatsell, speaking of the latter half of the last century, remarks that, "notwithstanding the great anxiety, trouble, and expense which many persons put themselves to to obtain a seat in the House of Commons, it is inconceivable how many of these very persons neglect this duty by not attending and taking a part in the business that is depending; and with what difficulty they are prevailed upon to give up their amusements and other less important avocations for this which, whilst they continue members, ought to be their first and principal object." This, however, is not one of the grievances of the present day; indeed, the grievance now is rather the other way—that on important occasions the attendance is apt to be greater than there is comfortable room for, if room at all. The early hour on last Tuesday at which members began to present themselves certainly showed anything but want of relish for Parliamentary duties or reluctance to attend. Before ten o'clock in the morning one member had made his appearance, and left his hat on a seat which he particularly coveted, and by noon the benches of the House might almost have been supposed to be set out for a competitive exhibition of the hatter's art. No places are specially allotted to members in the House of Commons, except that the front bench to the right of the Chair belongs to the Privy Councillors and the members for the City of London. In process of time this bench has become the peculium of the persons composing the Government, whether Privy Councillors or not, while courtesy assigns the corresponding bench on the left to the corresponding members of the Opposition. As late, however, as Sir Robert Walpole's time, the Premier and the leader of the Opposition both sat as Privy Councillors on the same bench. It is easy to understand that such proximity was found inconvenient, and the present Prime Minister once expressed his satisfaction that there was a table between him and the excited leader on the other side. Members who have received the thanks of the House in their places are allowed to keep them permanently, and a few fortunate members possess their habitual places by a polite understanding. A member is, however, entitled to mark his seat for the night if he has been present at prayers—a condition which may be supposed to promote, if not the piety of the assembly, at least its observance of pious forms.

While the regular attendance of members in the House of Commons is a custom which may deserve to be encouraged, it must be confessed that in some other respects this branch of the Legislature has been in recent years drifting into certain habits which by no means tend to raise its character. It is to be hoped that the scandals of last Session will not be repeated during the present; but, apart from actual disorder, there has been a growing tendency to set aside conventional amenities which cannot be ignored, and which it should be the object of all who have its reputation at heart to try to arrest by every means in their power. There is happily at present only one Keneally in the House of Commons, and the police may be left to deal, as they did promptly and effectually on Tuesday, with the gang of roughs and pickpockets who serve as his bodyguard in the streets. The treacherous subserviency to the mob which characterized the Executive during Mr. Gladstone's reign has fortunately come to an end, and members are no longer allowed to be insulted on their way to the House by attempts at ribald intimidation. Within the House, however, the observance of reserve and decorum might perhaps be more steadily cultivated. In such a body, while every member is no doubt theoretically on an equality with others, there are grades of personal importance and authority which, though no one would think of sharply defining them, are easily understood, and which ought to be respected. There are speakers to whom it is a privilege for the House to listen, and there are other speakers who, though they have the privilege to speak, are bound to use it with consideration to others and with some thought of the relative value of what they have to say to that of public time. The disorderly scene which occurred on the first day of the present Session when the members of the House of Commons were on their way to attend the Queen in the other Chamber may perhaps be taken as emblematic of the spirit which is unfortunately manifested by a certain class of members at other times. In going to the House of Lords, the Speaker, preceded by his mace, leads the way, while the Ministers and the chief men on the other side are supposed to attend him closely, and the rest of the members follow in the order of balloting. On Tuesday, although the Speaker was allowed his start, he had, from the headlong chase of the members behind him, some difficulty in

keeping it, and Mr. Disraeli, for one, was jostled out of the running and prevented from reaching the bar of the Lords. It is impossible to imagine anything more discordant with the tone of ceremonious dignity which ought to prevail on such an occasion than the tumultuous rush of members across the lobby in order to get well to the front in the other House. But much the same spirit may sometimes be detected even in the ordinary proceedings of the House. There is a want of respect for the leading men, a self-important obtrusiveness on the part of some members who might be content to remain in the background until they had in some way proved their right to a more prominent position. The usefulness of such a body as the House of Commons must necessarily depend in a large measure on the respect in which it is held by the public, and this will in turn depend on the respect which it shows for itself. It is not required that what are called private members should efface themselves, but simply that they should show a little reticence and modesty in using their opportunities of display.

PARISH REGISTERS.

THE domestic history of the English people for three hundred years before the accession of the reigning Sovereign is recorded, with more or less accuracy and completeness, in about ten thousand sets of volumes, each set consisting at the least of five separate books, and many of them comprising a much larger number. These invaluable and almost unique records are preserved in as many different places as there are sets. An extremely valuable set, just where the London smoke begins to give way to fresh air, was a few years ago lodged in convenient proximity to a patent stove. A very large number are stored in iron boxes, which may be supposed by ill-informed and worse-intentioned persons to contain plate; and a number nearly, or quite, as large as this may be found under the more immediate eye of their legal custodians in private houses. These volumes are, as our readers know, the parish registers of England and Wales. To a certain extent, but it is believed very imperfectly, their contents are preserved in duplicate in the various diocesan registries; but as original public records of almost priceless value, the safeguards for their protection are what we have above described. From the time of the passing of the Registration Act of 1836, the value of the parish register as a public record has been materially lessened. The registration of births and deaths has, for legal purposes, superseded that of baptisms and burials; and the well-known pair of long green books, the visible bane of bridal veils and the hidden stumbling-block of modern novelists, with their compendious introductory work of fiction, narrating under Parliamentary sanction the blissful crowning of the loves of William Hastings and Sophia Ann Mitchell on the 17th of March, 1836, by an entirely apocryphal "Vicar of Mary-le-bone," have replaced in much more elaborate form the single and simple old record how "Thomas Bishop and Susana Goodier were marryed by Banns Januar y^ 27." It would be unfair to future reviewers if we were to indicate the way in which these duplicate, or, as they are in fact, triplicate, entries have proved fatal to the literary claims of many a carefully constructed plot; and in charity to one or two well-known writers we will not tax our memory for instances in point.

The usual set of parish registers consists, as has been said, of five volumes. The first is the general register, which is probably best known by the regulations made with respect to it in the Seventieth Canon. This book, or series of books, commencing at various dates, as will be presently shown, contains all the recorded baptisms and burials till the year 1812, and all the marriages publicly solemnized till the passing of the Marriage Act of George II. in 1753. The second book is the Register of Marriages under the last-mentioned Act from 1754 till the general Registration Act of George III. in 1812; and the three others are the Marriage Register of 1813-1836 and the Registers of Baptisms and Burials still in use. In comparing the value of the personal information contained in these various books it may be said generally that the later registers are very much fuller than the earlier in their record of marriages; that they are on the whole more complete as regards baptisms; and that they fall behind the original registers to a most unsatisfactory degree in the very important matter of burials. They do indeed give the age of the person buried, which is seldom stated in the older books; but, except the mention of his place of abode, they give no other detail by which he may be identified. The greater freedom of an open page, as compared with spaces barred and fettered by lines and columns, was perhaps favourable to the descriptive entries which are frequently found in the old books; and, while "a poore vagabond boy unknown" is a description at least as definite as a workhouse name or an alias, the personality of "Old Francis who work'd in the Gravel Pit" stands out much more clearly, in a register near London, than if the entry had been "Francis Pitman, 70." From the same register may also be gathered many evidences of the practice of sending delicate children from the city to be "nursed" in the fresh air of the villages round.

The chief historical or antiquarian interest belonging to these records centres necessarily in the earliest register of the group, the "one parchment book" of the Canon. However unwelcome its first introduction may have been, and whatever may have been the resistance in some places to State intrusion within the province of the Church, especially where the tax-gatherer appeared in the background, there can be no doubt that the old register is now so highly prized as a local treasure that the shadow of a proposal to transfer the original volumes to the Public Record Office would be the signal for a unanimous protest of angry refusal. When, therefore, we venture to revive a suggestion which was made in official quarters, and locally advocated with some zeal, about a century since, the only form in which it can now be presented is that it would appear very desirable that official copies of the whole of these precious documents should be made, and preserved among the Public Records, illustrated to some extent, and in special cases, with pages in facsimile. For a brief and clear account of the eighteenth-century arguments upon this subject we are indebted to Dr. Nash, the historian of Worcestershire. This able and learned antiquary was fortunately possessed by a Herodotean love for all sorts of incidental digressions from his immediate subject; and he was engaged upon the history of Claines, a parish adjacent to Worcester, when the idea of an excursus upon Parish Registers seems to have occurred to him, suggested, as usual with him, by some local neglect. It appears that a pamphlet had been written by Somerset Herald of the time, Mr. Bigland, "a learned antiquary," containing some curious illustrations of the slovenly way in which the registers were then kept, and many valuable hints for their better management. "All entries," he had urged, "should be more descriptive"; assigning as a reason that their importance as evidence had increased, since "inquisitions *post mortem* are determined by Act of Parliament, and there has been no Heraldical visitation since the Revolution." The magnate of Doctors' Commons could not be expected to think much of the multitude without "coats," whose interests would only be indirectly served by his criticism; but it was by "others," not by Mr. Bigland, that a distinct proposal had been offered, that the Heralds' College should serve as a public repository for the registers. Complaint is made that at that time the registers were "carelessly kept, and often entrusted to the custody of an ignorant conceited parish clerk, who may neglect to make entries, or give what nicknames he pleases." "Old Mother Pummell" and "Tipling Tomlinson" are thus instanced by Somerset Herald, together with "Dr. Johnson's lady," an entry which would more directly provoke his official censure on the ground of its uncertainty.

The original orders for the provision of parochial registers date from 1538, and were rendered necessary in consequence of the dissolution of the religious houses and the cessation of their registers. The first was issued by Thomas Cromwell, the King's Vicar-General; and this order was continued by injunctions of Edward VI., Elizabeth, and James I. In the more important places, and in many other parishes of less note, the registers date from the time of the original order; but this is not found to be the case with the smaller and more retired parishes, and the Canon of 1604 indicates the beginning of the reign of Elizabeth as the earliest date from which the general record might be expected to exist. The register was to be compiled "so far as the ancient books can be procured, but especially since the beginning of the reign of the late Queen." Still the registers were ill kept to a great extent. Parliament interfered under the Commonwealth; registrars were appointed; and the curious entries which must be familiar to many of our readers, beginning "The purpose of marriage having been published," evidence the interposition of the civil power in relation to marriages. At the Restoration the charge of keeping the registers once more devolved on the parochial clergy; but it seems not to have been till after the Revolution that the subject again engaged the attention of Parliament, and in 6 and 7 William III., a duty being imposed on the various entries, the negligent clergy appear to have been for the first time exposed to the terror of the common informer. The commencement of the registers in many of the smaller parishes during the last decade of the seventeenth century is evidently traceable to this cause; but changes were slow to take effect in remote rural districts, and an Act of Indemnity was found necessary for the protection of the defaulting clergy in 4 Anne, c. 12. Instances may be found of the gradual awakening of the country parishes to the liabilities of the clergy under the Act of William in the fair-hand copies of several years in the existing registers, obviously made from very imperfect original memoranda—the name, and occasionally even the sex, of a baptized infant being in some cases left blank.

Except in some central and considerable places it is probable that few of the original registers are now in existence, most of the earlier records being represented by copies, made at various times, from the reign of Elizabeth to that of Anne. Sometimes these copies have led to singular antiquarian mistakes. In a small, but ancient, West Midland market-town the traces were believed to exist of an incumbency of almost patriarchal duration, from the pages of the register successively signed, "per me, A. B., Rector.", till some sceptical visitor discovered that the great majority of these signatures were preceded by a hieroglyphic which proved to be "ext^" *i.e.* "extractum." The town registers are of course far more complete and valuable records of English life than those of the country parishes, and those of the suburban parishes, again, are more complete than the provincial. In the original register of a parish near London there appears a record of the execution of Charles I. in its exact place, so entered with a blank margin on every side as to suggest the intention of the writer to surround it with a black border as soon as he could safely do so. A question of some interest in the history of religious opinion is raised by the continual occurrence, in the burial entries of a country town in the early part of the seventeenth century, of the phrase "a creature of Christ." Entries of the burial of infants by name abound; while children who never

lived are described by a word now used only as a medical or legal form; and it has been suggested with some show of reason that the unusual description just quoted may indicate children dying unbaptized. But apart from any matter of historical or public interest which the old registers may contain, many trifling, yet by no means worthless, traits of personal character may be gathered or inferred from them. The neat and precise incumbent is at once distinguished from his offhand or slovenly predecessor; the man of scholarly attainment is known by his little bits of Latin; the seventeenth-century High Church ecclesiastic marks the birth or baptism of his own child by the Church Festival as well as by the day of the month. The domestic parson carefully tells us of a time of home anxiety happily ended, "undecimâ horâ noctis"; and in the case of his eldest born, perhaps, writes "Deo juvante" as well. One incumbent in 1691 has left the really interesting detail of his induction to his benefice "per Thomam Fox, Decanum Decanat: de ffroome," thus indicating a time and place where the official existence and action of the Rural Dean was recognized. A century later, a scholarly archdeacon from Oxford notes from time to time in a few words of graceful Latin the character of some quiet life passed away, or heads the record of his baptisms with a hope adapted from the Greek of the Apocalypse touching another Book wherein *τὰ ὀνόματα αὐτῶν γεγραμμένα εἴη*: while his churchmanship almost gets the better of his charity as he relates, with a too manifestly implied inference, how a parishioner was drowned on the evening of a day when he had been measuring the ground for the new Baptist Chapel.

Now and then the use of the register as the parson's commonplace book produces an effect bordering on the grotesque. On the first page of the Baptismal Register now in use in a small country parish is inscribed, "The Black Italian Poplar by the Fish-pond was planted on the 14th day of January, 1818, being then six feet high, By me, R. E. O——, Curate." "Proh pudor!" adds his successor in 1822; "is this the place for registering a Black Poplar? J. R——, Curate." In the pages of these simple chronicles of bygone time even the ghosts of "the lost eleven days" may almost be recognized as they flit silently and mournfully across the scene; and although an isolated inference here and there is not sufficient to prove a trace of a once obstinate rural resistance to an innovation upon established custom, it is possible that, on a wider comparison of the registers of 1752, some interesting evidence on the subject might be brought to light. But enough may have been already said to show that, on many and very widely differing grounds, it might prove both desirable and useful to inquire into the details of the history of the domestic and social life of England which are still preserved, though practically hidden from sight, in the parish registers.

DIETRICH OF BERN.

WE have no wish to war with the dead, nor should we willingly rake up again a controversy eleven years old either with the dead or with the living. When Mr. Kingsley was Professor of History at Cambridge, we had occasion to speak more than once with some degree of strength of some of the writings which he put forth in that character. The mere fact of his death cannot make those writings better or worse; but a fact which happened some while before his death made a wide difference in the way in which any fair critic would look at them. One act of Mr. Kingsley's life might well be taken as wiping out all old scores on the ground of anything that he said or did as Professor. To put the matter in plain words, he was appointed to an office for which he was unfit, and, when he found out his own unfitness, he gave up that office. We are not speaking without book when we say that Mr. Kingsley gave up his professorship, not from caprice, not from weariness, not from the ambition of any higher post, but from the honest conviction that he had made a mistake in accepting the office at all. An act like this may fairly be set against the original mistake and against any other mistake that followed it. It was the act of a just man, and something more than a just man. It was the act of a man who had clearness of moral vision enough to see what was right even when it told against himself. And it is an act which as yet stands by itself. It is an act which as yet had no imitators, even where an imitation of it would have been most for the welfare of learning. It would be easy to name Professors who are at least as unfit for their posts as Mr. Kingsley was, but whom it has not been found so easy to convince of their own unfitness as it was to convince Mr. Kingsley. We have been led into these remarks on a subject to which we should not have gone back of our own accord, because, in a preface to a new edition of *The Roman and the Teuton*, Professor Max Müller has made some remarks which bear directly on our criticisms of that work when it appeared eleven years ago, and which start one or two points which seem worth examining on their own account. We are not going to review the book again. Indeed we really do not see that Professor Müller's estimate of it really differs very much from our own. We spoke strongly in criticizing the work of a living writer which we thought was likely to do harm to sound learning. Professor Müller writes gently and apologetically in editing the work of a deceased friend. But the two estimates are really as nearly the same as they could be when they were written from two such opposite points of view. Professor Müller "doubts" whether Mr. Kingsley would have wished *The Roman and the Teuton* to be handed down to posterity; from the fact that Mr. Kingsley resigned his professorship we infer that he would not have wished it. But we have no need to argue this point; we have no need to review the book again. Our present business is with Professor Müller, and not with Mr. Kingsley, and if we have to mention Mr. Kingsley's name again, it will be purely accidentally, and because we cannot help it.

We do not find, however, that we have any real question, either of fact or of opinion, to dispute with Professor Müller. Indeed we are not quite sure whether Professor Müller, in defending his deceased friend from certain adverse critics, really referred to ourselves or not. Professor Müller says:—"For instance, Kingsley's using the name of Dietrich instead of Theodoric was represented as the very gem of a blunder, and some critics went so far as to think that he had taken Theodoric for a Greek word, as an adjective of Theodorus." Now it is perfectly true that we did represent the use of the name Dietrich in this case as "the very gem of a blunder"; indeed we used it in illustration of the doctrine that only an ingenious man can make a good blunder. A dull man, we expressly said, would not have spoken of Theodoric as Dietrich in this particular way. But it was not we who hinted that Theodoric had been taken for a Greek word as an "adjective of Theodorus." Indeed we do not know what is meant by Theodoric being an "adjective of Theodorus." What we did hint was that the form Dietrich was used under the notion that Theodoric was, not a Greek word, but a Greek corruption of the Gothic name, and that to write Dietrich was in truth to restore that name to its proper form. Our notion was that the form Dietrich was used because it was the form used in the Nibelungen Lied and by German writers generally, and because it was thus thought to be the truest and most correct form of the name of the Gothic King. Now we need hardly say that Dietrich, the High-Dutch form of the name, was not and could not be the true form of the name of a Goth, and that the usual form Theodoric, even if its vowels have been a little tampered with to give it a Greek look, keeps the right consonants, consonants which are equally Gothic and English. To call Theodoric Dietrich seemed to us to belong to that peculiar class of blunders in which a man, in striving to correct a common usage, goes himself much further wrong than the common usage. Blunders of this kind are always especially amusing, but we repeat that it is not every man who can make them. They can only be made by those who combine half knowledge with real ingenuity. Perhaps we are wrong in our inference. It may have been, as Professor Müller thinks, some quite different line of thought which led to the use of the word in this case; but, granting that the line of thought was what we thought it was, the use of the form Dietrich in this case certainly was a very gem of a blunder of this particular kind. The usual form was the right one; the attempt to correct the usual form was the immediate source of error.

But it is quite possible that we were wrong, and that Professor Müller is right. It may be that the name Dietrich was preferred, in perfect knowledge of the difference between the High-Dutch and the Gothic form, but with the object of pointing out the connexion between the Theodoric of history and the Dietrich of legend. Professor Müller admits that, in such a case, "a few words on the strange mixture of legend and history might have been useful." We should have said that they would have been not only useful, but absolutely necessary. Still it may be as Professor Müller suggests. But he leaves out of sight that we spoke of the use of the form Dietrich as not standing alone, but as being one among several strange descriptions of other people. We thought that, when Theodoric was called Dietrich, it was of a piece with calling the Eastern Emperor the "Kaiser of Byzant," a formula of which Professor Müller gives no explanation. It is possible that it may have been done to suggest the continuity between Justinian and Francis the Second; but here, again, a few words of explanation would certainly have been useful.

But our question with Professor Müller goes a little further. The case is this:—Theodoric, allowing for a slight change in the vowels, is the Low-Dutch, the Gothic and English, form of the same name which in High-Dutch is Dietrich. The obvious rule would be that, in speaking of persons bearing that name, an Englishman should say Theodoric and a German Dietrich. We may add that a Frenchman would say *Thierry*, and a Hollander *Dirk*, those being the forms which the name has finally taken in their several tongues. This is the rule on which we commonly act, when there is no particular reason to the contrary. The conqueror of England will naturally appear as *William*, *Wilhelm*, *Guillaume*, or *Willem*, according to the tongue in which he is spoken of. According to this rule, we should not be at all surprised at finding any German writer speak, like Johannes von Müller, of Theodoric as *Dietrich von Bern*, any more than we should be surprised at his speaking of an English king as *Wilhelm* or *Heinrich*. To speak of Dietrich in English would, from this point of view, be much the same as to say that Abbot *Friedrich* was deposed by King *Wilhelm*. But the case of Theodoric and Dietrich is not quite the same as this. It comes nearer to the case of *Karl*, *Charles*, or *Charlemagne*: but it is not quite the same as that. There is a great historical Theodoric—*Thiederik*, if we mean to be perfectly right—who stands out in history by that particular form of the name above all other bearers of it. There is also a mythical person who stands out as conspicuously in legend by the other form of Dietrich. Here, then, there would at first sight be reason for always speaking of the historical hero as Theodoric, and of the legendary hero as Dietrich. It would seem to be so important to distinguish them that it might be thought

well to call the historical person Theodoric, even in writing High-German, and the mythical person Dietrich, even in writing English. Then comes in the fact that the mythical hero also appears, in another branch of Teutonic literature, in a form which, as contrasted with Dietrich, we may call the same as Theodoric; the *Thjodrekr* of the Edda. And there comes in the much more important fact that the Theodoric of history and the Dietrich of legend have got inextricably rolled into one. The real or supposed deeds of each have been attributed to the other. In speaking of Theodoric, we must not forget his connexion with Dietrich; in speaking of Dietrich, we must not forget his connexion with Theodoric. The thing therefore becomes really puzzling. Unless the matter in hand is so perfectly clear as to exclude all cavil, it is almost dangerous to speak of either hero by either name, without some kind of explanation. One form may be best for the initiated, and another for outsiders. Local nomenclature comes in also as well as personal nomenclature. It is pleasant to find old Tschudi thinking it needful, when he speaks of Verona, to explain that he means "Dietrichsbern in Lamparten." To call Verona *Dietrichsbern* is a short way of calling up a whole crowd of associations in those who know all the Dietrichs and all the Berns; but such a way of speaking would be meaningless to the world in general.

There is then, as far as we can see, no real difference between ourselves and Professor Müller. Professor Muller allows that an English writer should not call Theodoric Dietrich without some explanation. We can conceive cases where it might be well to call Theodoric Dietrich, provided some explanation were given. All that Professor Muller has to say about the name, though very curious and instructive, hardly bears on the point from which the controversy, if we may so call it, first started. The different forms of the name, as collected by Professor Muller, make an amazingly long list, and yet we conceive that it is only meant as a list of forms applied to the one great Theodoric. For it would be easy to make it longer still by taking in all the forms borne by all the bearers of the name. And to Professor Muller's researches we might add that the Gothic name seems, oddly enough, to have got more thoroughly Hellenized in Latin than in Greek hands. In Malchos and Zosimos he appears as Θευδέριχος, which is one degree nearer to the Gothic, though not to the English, spelling than the Theodoricus of the writer whom we are glad to be taught to call the annalist of Ravenna, instead of the awkward formula of the "Anonymus Valesianus ad calcem Ammiani Marcellini." Then the Ravenna annalist tells us that the plate by means of which the King used to sign his name had four letters engraved, for which four letters the annalist gives us five, "Theod." *Th* then was expressed by one letter; but was it, as is commonly assumed, a Greek Θ, or was it the Gothic equivalent which looks more like Ψ? So again it is perfectly true that proper names do not always conform to Grimm's Law, and we might talk for a long while on the question in dispute between Grimm and Professor Muller as to the respective antiquity of High and Low Dutch. It is a great point for Professor Muller's view if he has caught a *Deudorix* and a *Teutiorix* much older than the East-Goth Theodoric, though at the same time we might whisper in his ear not to forget Teutates and Orgetorix. But all this has very little to do with the matter in hand. Let us grant that proper names often sin against Grimm's Law, as they must do when they are carried bodily from one people to another. Let us grant also that the High-Dutch forms may be as old as the Low, or older. But in this particular case, as between the two forms Theodoric and Dietrich, Grimm's Law is strictly observed, and the Low form is, at least in existing writings, older than the High. We are always glad to hear anything that Professor Muller has to say on the subjects of which he is so great a master; but what he says now has really very little to do with the original matter in hand.

But in the last two or three pages of the preface Professor Muller goes away into matters of which he is not so thoroughly master. It is always a weak line of argument to defend the mistakes of a modern writer by saying that he followed the lead of some great earlier writer. Nor is it quite the line of historic study which we should chalk out when Professor Muller says, "The permanent interest attaching to these lectures does not spring from the facts which they give; for these students will refer to Gibbon." There was a time—it may be past—when even the general reader not only referred to Gibbon but read Gibbon. Students, we may hope, will read their Gibbon, and will also refer to, and sometimes even read, Gibbon's authorities. To call Odoacer and Theodoric Kings of Italy, still more to say, as modern writers so constantly do, that they "took the title of King of Italy," turns the history of the times so utterly upside down that the example of Gibbon himself cannot justify it. But it is to be noticed that it is only incidentally that Gibbon ever calls them Kings of Italy. He points out quite clearly, though less prominently than might have been wished, that they never called themselves so. They were kings, but not Kings of Italy; indeed a territorial title like King of Italy was unknown till ages later. The Teutonic king was in formal style "Rex" simply. He is rhetorically "Gothorum Romanorumque regnator," and we even read of Odoacer that "regnavit Italiæ"; but "Rex Italiæ" they never are. The oddest thing of all is that, where Procopius, in describing the death of Totilas, makes the young Goth say to his slayer Asbados, τί τοῦτο, ὦ κύων, τὸν δεσπότην τὸν σαυτοῦ πλήξων ἔρριψας, this appears in Gibbon as "spare the King of Italy." Milman, in a note, points out the strange perversion, and Professor Müller might have added that in *The Roman and the Teuton* Milman is followed and not Gibbon. What Professor Müller means when he says that Gibbon shows how Odoacer "was determined to abolish the useless and expensive office of viceregent of the Emperor" we cannot in the least guess. What Odoacer did, what Gibbon distinctly shows that he did, was to substitute a nominal viceregent of the Emperor—practically, of course, an independent King—for a separate Emperor in Italy. Professor Müller again says:—"In speaking of the extinction of the Western Empire with Romulus Augustulus, Kingsley again simply followed the lead of Gibbon and other historians; nor can it be said that the expression is not perfectly legitimate, however clearly modern research may have shown that the Roman Empire, though dead, lived." This last sentence we do not understand; but to speak of "the extinction of the Western Empire with Romulus Augustulus" undoubtedly is, if properly explained, perfectly legitimate. But if Professor Muller refers to anything that we have said, we can only say that the phrases to which we objected were quite different. We objected to speaking of Augustulus as "the last Emperor of Rome," and to recording the formal reunion of the Western Empire with the Eastern with the comment, "So ended, even in name, the Empire of Rome."

We have only to add that Professor Muller speaks throughout of his reasons for not altering or correcting this or that in the book for which he wrote a preface. He would of course have been quite wrong to correct or alter anything in the text, whatever he might do in the way of corrections, after Dean Milman's fashion, in a foot-note. We cannot say that we agree with Professor Muller as to its being worth while to reprint *The Roman and the Teuton*; but there can be no doubt that, if it was to be reprinted, it was right to reprint it word for word as its author left it.

THE QUAKER'S HAT.

A VERY big book might be written on the part played by the hat in history. If the Mad Hatter of *Alice in Wonderland* had undertaken to write a history of the world, he could have summed up the leading epochs in the development of European civilization under headings designated by the prominent headpiece of each epoch. What better symbol for the old Greek epoch than the *Stephanos*, for the old Roman epoch than the civic crown, for the Byzantine Empire than the diadem, for the middle ages than the Papal tiara, or for the Revolution than the *bonnet rouge*?

Perhaps no other human headpiece has been the cause of so much stir in society as the hat of George Fox, the founder of Quakerism. We have seen the pilgrims at Thonon, in Savoy, kiss the hat which the eager Francis de Sales forgot to put on his head when he started upon his preaching mission against the Calvinists. What would one give to see the far more important hat which George Fox first refused to put off in the presence of the magistrates and ministers of Cromwell's reign? "Proud flesh," says George Fox, "looks for hat honour." The refusal to uncover the head before magistrates, like many other parts of the Quaker ritual, had been intermittently attempted by some of the earlier Puritans. "Saltmarsh was the first," says Dr. King, in his Life of John Locke, "that began to be scrupulous about the hat." It appears, however, from Camden's Annals, that more than a century earlier Hachet and some of the first Marprelates refused, in Elizabeth's reign, to take off their hats before the magistrates. That which was undefined and tentative for a few here and there among the forerunners of Quakerism became a fixed and hard ritual for thousands when it was adopted by the powerful mind of George Fox. He claimed a Divine commandment for his apparent want of respect and politeness. "When the Lord sent me forth into the world He forbade me to put off my hat to any, high or low. O the rage that was then in the priests, magistrates, professors, and people of all sorts! But the Lord shewed me that it was an honour invented by men in the Fall and in the alienation from God, who were offended if it were not given them, and yet would be looked upon as saints." His disciples accepted at once and without hesitation the command to pay no "hat honour" to their neighbours, and were satisfied with the arguments produced by their leader. Before they came into conflict with the higher powers upon this point they had to endure "blows, punches, and beatings for not putting off their hats to men," and often "had their hats violently plucked off and thrown away." Many a good Quaker, George Fox tells us, lost a good hat through his resolute obedience to this novel unsocial ritualism. Many Quaker tradesmen lost their customers at the first, for "the people were shy of them, and would not trade with them, when Friends could not put off their hats, nor bow, nor use flattering words in salutations, nor go into the fashions and customs of the world; so for a time some Friends that were tradesmen could hardly get money enough to buy bread." But when it was discovered that the yea of these queer persons "was yea, and their nay was nay," their customers returned, until the complaint became common in the North of England amongst "envious professors, If we let these Quakers alone, they will take the trade of the nation."

The first occasion on which the Quaker's hat came publicly and officially into trouble was at the Launceston Assizes in the year 1656, before no less a person than Chief Justice Glynn. "When we were brought into the Court," says Fox, "we stood a pretty while with our hats on, and all was quiet, and I was moved to say, 'Peace be amongst you!' 'Why do you not put your hats off?' said the Judge to us. We said nothing. 'Put off your hats,' said

the Judge again. Still we said nothing. Then said the Judge, 'The Court commands you to put off your hats.'" George Fox, with amazing simplicity, asked for some Scriptural instance of any magistrate commanding prisoners to put off their hats. He next asked to be shown, "either printed or written, any law of England that did command such a thing." Then the Judge grew very angry, and said, "I do not carry my law books on my back." "But," said Fox, "tell me where it is printed in any statute-book, that I may read it." The Chief Justice cried out "Prevaricator!" and ordered the Quakers to be taken away. When they were brought before him again, the Chief Justice asked Fox whether hats were mentioned at all in the Bible? "Yes," said the Quaker, "in the third of Daniel, where thou mayst read that the three children were cast into the fiery furnace by Nebuchadnezzar's command with their coats, their hose, and their hats on!" Here was a proof that even a heathen king allowed men to wear hats in his presence. "This plain instance stopped him," says Fox. "So he cried again, 'Take them away, gaoler;' accordingly we were taken away, and thrust in among the thieves, where we were kept a great while." After nine weeks' imprisonment "for nothing but about their hats," as the Chief Justice told them, they were again brought before him, grimly wearing the offending headgear. "Take off their hats," said the Judge to the gaoler. "Which he did," says Fox, "and gave them unto us; and we put them on again. Then the Judge began to make a great speech, how he represented the Lord Protector's person, and that he had made him Lord Chief Justice of England." The Quakers were incorrigible. They were sent back to prison, but not really so much for the wearing of their hats as for the suspicion that they were Royalist emissaries affecting religious singularity in order to win their way amongst the extreme Puritans. Indeed, a Major Seely actually gave evidence—false enough—that he had heard George Fox boast that he "could raise forty thousand men at an hour's warning, involve the nation in blood, and so bring in King Charles."

These first public prosecutions for the sake of the hat happened in 1656. In the following year John ap John was put in prison at Tenby for wearing his hat in the church. George Fox went to the mayor, justice, and governor of the prison, and asked them why the Quaker was imprisoned, while the Puritan minister was left in freedom; he had seen the minister "in the steeple-house, with two caps on his head, a black one and a white one, while John ap John had but one." The brims of "the priest's" hat were cut off; the brims of the Quaker's hat were left on "to defend him from the weather." Was the difference in brims cause enough for imprisonment? "These are frivolous things," said the governor. "Why then," replied the patriarch of the Quakers, "dost thou cast my friend into prison for frivolous things?" In the year 1658 many Friends were in trouble in London with Sir Henry Vane, "who, being Chairman of Committee, would not suffer Friends to come in, except they would put off their hats. Now, many of us having been imprisoned upon contempts (as they called them) for not putting off our hats, it was not a likely thing that Friends, who had suffered so long for it from others, should put off their hats for him." Vane, however, did not make so much ado about it as the country justices or the high legal officers had done. After some slight word-conflict, he allowed these quaint irreconcilables to plead before him with covered heads.

George Fox speaks of the Restoration of Charles II. as a judgment-day "upon that hypocritical generation of professors, who, being got into power, grew proud, haughty, and cruel beyond others, and persecuted the people of God" (his periphrasis for Quakers) "without pity. O the daily reproaches, revilings, and beatings we underwent amongst them, even in the highways, because we would not put off our hats to them!" The Restoration did not bring about a total cessation of Quaker persecution, but it brought some amelioration of their condition. The easy-going Charles II., always personally tolerant, was much more amused than offended when the Quakers refused to uncover their heads in his presence. Not only upon Fox himself, but upon Hubberthorn, Ellis Hooke, and several others, the King made a very pleasing impression. In December 1660 Charles granted an interview to Thomas Moore, of Hartswood, who had been a justice of peace, in order to receive a petition upon Quaker suffering. There was much debate amongst the courtiers, in the presence of the King, what they should do with this sturdy Quaker's hat. All agreed that he could not be called in with his hat on, and that he would never take it off himself. Some proposed that it might be removed gently by the Clerk of the Council. The King, the greatest gentleman of them all, declared that the hat should not be taken off at all, unless Thomas himself chose to remove it; no other should take it off. "When I saw the King at the head of the table with the rest of the Council," says Moore, "I made a stop, not knowing but that I might give offence; when one of the Council spoke to me and said, 'You may go up; it is the King's pleasure that you may come to him with your hat on.'" His whole account of the interview shows that there was not a particle of rudeness or impertinent self-assertion in the sturdy Quaker. Six years later, when Adam Barfoot "came out of Huntingdonshire to warn the King," he met Charles at Whitehall, "betimes in the morning, going a hunting." Adam "stopped to the coach-side," says Ellis Hooke, in a letter to Margaret Fell, "and laid his hand upon it, and said, 'King Charles, my message is this day unto thee, in the behalf of God's poor, afflicted, suffering people.'" When he came to the coach-side, the footman took off his hat; "but the King bid him give the man his hat again, and was very mild and moderate." Similar testimonies to the good-natured and gentle manner of Charles II. from men who were the very opposite of courtiers and cavaliers, occur frequently in the autobiographies and letters of the first generation of Quakers.

They were quite as determined to remain covered before Charles's Parliament as before Charles himself. In May 1661, Edward Burrough and two other Quakers were cited before a Parliamentary Committee. There were "some obstructions," says Burrough, "about our hats, which at last were taken off by one of them." A few days later, some members procured four Quakers admittance to plead at the bar of the House against the proposed Bill to "compel certain persons called Quakers to take lawful oaths." By the vote of the House they were called in; "and after some little debate at the door by some of the members about our hats," says Burrough, "the sergeant came and told us, we might come in with our hats on or off, which we would. So into the House we were conducted by him, with our hats on; and within the House near the bar he took them off." The hat had, in fact, become the war-standard of this quaint army of non-fighters, and its victorious maintenance is chronicled always with a kind of gleeful and quiet humour by the Quaker autobiographers.

In the seventeenth century it seems to have been as usual for men to keep the hat on in some assemblies which were not religious as it is now for women to wear their hats or bonnets at all public assemblies. In the account of the meeting of the English "Academy, or Royal Society," in the Travels of the Grand Duke Cosmo, in the year 1669, it is implied that the fathers of scientific congresses conducted their business with their hats on. "They observe the ceremony of speaking to the president uncovered, waiting from him permission to be covered." The refusal of hat-honour by the Quakers was at first a chance testimony against supposed worldly and unreal courtesy; but in time the negative refusal to take off the hat was fossilized into a kind of positive ritualistic symbol; it became the duty of a Friend of God to keep his hat on. When William Penn, a man of utterly different spirit from George Fox, was at the Court of the religious Princess Elizabeth at Herford, in 1677, he argued against hat-honour in the language of his spiritual master. "The hat cloketh" (he said to "a certain Great or Earl") "because it telleth tales. It telleth what people are; it marketh men for separatists; it is a blowing a trumpet, and visibly crossing the world; and this, the fear of man cannot abide." But, when he was closeted with his own sovereign, he spoke of the Quaker's hat in a more courtierly and less pretentious tone. The King asked Penn to give him his own explanation of the difference between their religions, Roman Catholicism and Quakerism. The Quaker answered by pointing out the symbolical difference between the hats worn by the King and by himself. "My hat," said he, "is plain. Thine is adorned with ribbons and feathers. The only difference between our religions lies in the ornaments which have been added to thine." No Quaker of the Commonwealth period could have brought himself to give utterance to such a mild definition of Popery. The Quaker's peculiar hat, after lingering long as an exterior sign of the religion of the wearer, has now nearly wholly disappeared. Whether the refusal of hat-honour is disappearing with the broad-brimmed symbol, we do not know, but we believe that there are some "Friends" who remove their hats to ladies, and we know that there are some who take them off when they visit a church.

We must not omit to mention that the fiercest controversy within the Quaker sect itself in Fox's time was also connected with the hat. The once famous John Perrot determined to out-quaker Quakerism, and to develop it along those lines which Fox had pleased to cut short. Fox often speaks bitterly of this schismatic and of "those that run out from truth with him." Perrot naturally asked, Why, if it were no true honour to neighbours and magistrates to remove the hat to them, it can be true honour to God to remove the hat to Him?—which Fox and his disciples invariably did in prayer. God, said Perrot, does not demand hat-honour, but heart-honour. He spoke too late, however. At the close of the seventeenth century there was no longer sufficient raw material in England for the formation of new sects; the amazing religious productiveness of the nation had come to an end. The general Quaker body remained content with the casuistic arguments provided by their leader for the retention of the inherited habit of uncovering the head in worship. Fox's latest declaration on the subject of the hat was made at Harlingen, in Friesland, in 1677. We quote it for the proverb which he cites:—"The very Turks," says he, "mock at the Christians in their proverb, saying, 'The Christians spend much of their time in putting off their hats, and showing their bare heads to one another.' Now is not the Turk's proverb a reproach to the Christians, and have not you (the Burgomaster and Council of Harlingen) fined and imprisoned many because they would not put off their hats to you, and show you their bare head?"

DR. SCHULTE ON CLERICAL CELIBACY.

THE appearance of a work from Dr. Schulte's pen on Clerical Celibacy (*Der Cölibatszwang und dessen Aufhebung geschichtlich*, Bonn, 1876) is both an important fact in itself, and marks a new phase in the Old Catholic movement in Germany. And, accordingly, the review of it which has just appeared in the *Allgemeine Zeitung*, evidently from a friendly hand, directs

attention to its object and probable influence, as well as to its intrinsic interest. It may be remembered that, at the Old Catholic Synod held last year at Bonn, Schulte deprecated any immediate action in this matter, and especially insisted, with obvious reason, that individual priests should not, like Father Hyacinthe, take the law into their own hands. His chief motives for counselling delay were, first, that it was not yet clear how far men's minds were made up as to the compatibility of a married clergy with the Catholic ordinances of the Mass and the Confessional; secondly, that in some countries the Concordats with Rome might involve practical difficulties about the abrogation of the law. He now announces that, if it should happen that the community, whose wishes he is desirous of ascertaining, agree with him, and if no legal difficulties stand in the way, he shall be one of the first to vote for the change, and shall consider that the right time for making it has arrived. On this question of policy it is unnecessary, and indeed scarcely possible, for us to pronounce any definite opinion. It must obviously depend on many detailed considerations of which the Old Catholic leaders can alone be in a position to form a competent judgment. But Dr. Schulte is not a mere agitator or pamphleteer. He does not write to advocate a theory, still less to appeal, as in dealing with so delicate a question would be easy enough, to popular prejudice or passion. He is a canonist and historian of no mean order; and if he desires to see an alteration in what has been for many centuries a fundamental disciplinary institution of his Church, it is because, in the first place, he is prepared to show that, on historical and canonical grounds, the measure is abundantly justified. And here we are glad to observe that his reviewer, whose name is not given, but who speaks as one having authority among the Old Catholics, is quite in accordance with him. He, too, abstains carefully from claptrap arguments or invective, and expressly disclaims all idea of taking a Protestant standpoint. His appeal is to "Holy Scripture and the Œcumenical Councils of the ancient Church," by whose verdict he exhorts the Old Catholics to let themselves be guided. "But as it is clear, and admitted by all Catholic authorities, that the law of celibacy is neither based on Scripture nor on any ordinance of the Universal Church, as also that all decrees on the subject emanated originally from local Synods, and afterwards from Popes, and finally that the invalidity of clerical marriages was first established by a civil law and introduced into the Latin Church by a Papal Constitution at the Lateran Council of 1123, Old Catholicism would condemn itself by indefinitely postponing a decision on this point." There is a slight inaccuracy about the last statement of fact. The earliest sanction of a General Council may have been—though we half suspect the writer was thinking of the smaller Lateran Synods of 1059 or 1074 given at the first Lateran in 1123, but Hildebrand some forty years before had taken the decisive step of making clerical marriage invalid as well as unlawful, which was the turning-point in the whole history of the institution of celibacy. On this we shall have a word to say presently. Meanwhile, we are glad to observe that Schulte's reviewer appeals, as we have no doubt he does himself, not simply to his own party, but to the great body of Roman Catholics. It is certain, he observes, that there are hundreds and thousands of members of the Roman Church who are by no means in harmony with the decrees of the Vatican Council, and would readily lend a hand to any scheme which they thought feasible for the reform of the Church: but the first condition of the success of any such undertaking is the abolition of the law of celibacy, which keeps the clergy in slavish dependence on their superiors, and, above all, on the Pope, who could at any moment abrogate it, but will never do so without having some very strong pressure brought to bear upon him. The writer adds that he will never abandon the hope of seeing the clouds of Vaticanism disperse, and the light shine once more on the millions who are at present overshadowed by it. And he quotes with satisfaction Schulte's assurance that, in publishing this book, he has meant "to discharge a duty to his Catholic brethren and his fatherland, while he leaves the result with confidence in the hands of God." Before noticing the contents of the work, it may be worth while briefly to recall to our readers' recollection the main historical facts of the case.

It is often assumed by Roman Catholic writers and others that clerical celibacy has from the first been the rule, or at least the all but universal practice, of the Church, while they are silent as to any evil consequences or dangers resulting from it, if indeed they do not—as is often the case—indignantly repel such a charge as libellous. Yet only the most complete ignorance of Church history, ancient, mediæval, and modern, can explain or excuse so paradoxical a contention. It is unquestionable that during the early ages bishops and clergy were free to marry, though it is also true, as Mr. Lecky points out, that a feeling, based on certain well-known passages in the New Testament, had existed from the beginning that celibacy was *per se* a higher state than marriage, and therefore better suited for the consecrated ministers of the altar. But that view, whether right or wrong, is a totally different thing from the obligatory rule afterwards imposed in the West. It is also true that from the earliest times the second marriage of priests was discountenanced, if not positively forbidden, being held to conflict with St. Paul's injunction in 1 Tim. iii. 2, 12. This again is, however, quite a different question. Then gradually the notion grew up that married priests should cease after ordination to cohabit with their wives; but the Council of Nice, when appealed to on the subject, refused to impose any such restriction upon them, though some local Synods had already enjoined it. Towards the close of the fourth century Pope Siricius issued in 385 the earliest authentic decretal still extant, strictly interdicting the marriage of the clergy, and Hefele argues that this was rather intended as a confirmation of the existing rule than as creating a new one. Be that as it may, clerical marriage continued for centuries afterwards to be openly practised in the West, though a stigma attached to it; in the East it became the rule that secular priests should be married once, but bishops should be taken exclusively from the regular clergy, who were of course celibates. We may pass over the dark night of immorality and violence which had settled over the Latin Church before the Hildebrandian reforms—"the heavens all blood, the wearied earth all crime," when it was popularly believed that the Last Judgment was at hand—with one quotation from Ratherius, a bishop of the tenth century, who says that, if he were to enforce the canons against unchaste persons administering sacred rites, none but boys would be left in the Church, and if he enforced the canons against bastards, they also would have to be excluded. A Roman Catholic Bishop of our own day, appointed to a South American see, is said to have made a very similar remark on taking possession of his diocese; and the late Archbishop English of Trinidad was generally believed to have been poisoned by his clergy, whose irregularities he was endeavouring to restrain. This brings us to the great reform at the end of the eleventh century which has made the name of Gregory VII. one of the most famous in history, and has drawn upon him such passionate eulogies and such virulent abuse. On the whole, there can be no doubt whatever, among those acquainted with the history of the period, that his panegyrists are much more nearly in the right than his assailants. But that is too wide a question to linger upon here. As regards the particular point we are immediately concerned with, one fact alone, on which two writers so unlike each other and both so strongly opposed to the principle of clerical celibacy as Mr. Lecky and the late Dean Milman are agreed, goes far to justify the energetic, not to say cruel, policy by which he enforced on the priesthood the observance of what had then long been the canonical rule of the Western Church. There was at the time a real and very imminent danger of the clergy sinking into an hereditary caste, which would have destroyed their spiritual influence altogether, and thereby removed the only available check in that feudal age on a crushing tyranny fatal alike to moral and material civilization. That Hildebrand himself was keenly alive to this danger there is ample proof, and it furnishes the best apology for his conduct in the matter, though it supplies no pretext for the perpetuation of his policy under circumstances radically different. We cannot but think that modern assailants of clerical celibacy, in their zeal for a righteous cause, are apt to be unjust to his memory.

It must be admitted, however, that if such desperate measures were, as would seem to be the case, necessary in the eleventh century, the remedy soon proved almost worse than the disease. Scarcely a Council, local or general, met during the next four centuries which did not ring with complaints of the twin clerical vices of simony and incontinence. It actually became a common custom, as it is still, or was very recently, in parts of Germany, for the people to insist on their priest taking a concubine for the protection of their families. There is even a canon extant of a Spanish Synod held at Palencia in 1322, condemning laymen who compel their pastors to do so. The same custom prevailed in Switzerland. And Nicholas de Clemangis, who took a prominent part in the General Council of Constance in 1414, not only notices the practice as a common one, but roundly asserts that the laity were persuaded that priests *never* lived a chaste life, and, where no evidence of concubinage could be detected, assumed as matter of course their indulgence in more heinous sins. The passage is a very startling one, but will hardly bear quotation, even in the original Latin. We shall not proceed here to examine the moral condition of the Roman Catholic clergy in our own day, but it is quite certain and perfectly well known to the ecclesiastical authorities that in some parts of Europe, and still more in South America, their manner of life is only too like what was openly denounced by a host of mediæval writers. At the same time it would be most unfair to deny that there is another side to the picture, and that the celibate system, in its action on higher natures, has produced very different effects. As Mr. Lecky puts it, "no body of men has ever exhibited a more single-minded and unworldly zeal, refracted by no personal interests, sacrificing to duty the dearest of earthly objects, and confronting with undaunted heroism every form of hardship, of suffering, and of death." Yet it is obvious to remark that, on the one hand, even such advantages may be too dearly purchased, and on the other, that men may, and often do, voluntarily dedicate themselves, like *e.g.* the late Bishop Patteson, to a single life of unselfish devotion to the spiritual and temporal welfare of their fellows when no rule of celibacy is imposed. However, we are not now engaged in discussing principles, but in recording facts.

Professor Schulte, as we gather from his reviewer, has carefully examined the bearings of the existing rule on the position of the clergy of his Church, and is prepared to show that it is on the whole most prejudicial to their character and influence. He will probably carry with him many of his co-religionists in his strictures on the mischievous effects, both moral and intellectual, of the narrow system of separate seminary education of the clergy from early boyhood, which is said to be rendered necessary by the celibate rule. He complains that one consequence of this method of training is that the majority of them read nothing but a few Ultramontane newspapers and religious books, and are wholly

devoid of literary culture or capacity. Another very disastrous result—which is indeed notorious—is that the great majority are drawn exclusively from the lower classes of society, and that their tastes are coarse and frivolous when not actually vicious. He adds, reasonably enough, that the present system of clerical education conspicuously disqualifies the priesthood for the office they are always anxious to claim, and do very frequently discharge, of educating others. And he appears to anticipate that an important step would have been made towards the ultimate reunion of the Catholic and Protestant Churches if this great difference of practice had ceased to exist between them, though he takes care to guard himself against being supposed to advocate any merging of Old Catholicism in Protestantism. We have probably said enough to convince our readers that Dr. Schulte's work is remarkable both in itself and in the circumstances of its appearance. We shall watch with interest the impression it produces on those to whom it is primarily addressed. Nor will Roman Catholics generally be able altogether to ignore such a challenge issuing, for the first time almost since the Reformation, from a learned and influential writer in their own ranks, who has grown up and lived to mature age in the midst of the system which he comes forward to condemn, and who was for years the authorized exponent, under high ecclesiastical sanction, of that canon law to which it owes its origin and its validity. They may perhaps remember the saying of a canonized Saint, whose name has escaped our memory, that two-thirds of the priesthood would lose their souls, one-third for avarice, the other for incontinence. That seems a startling comment on the operation of the existing law.

THE STORY OF THE BREMERHAVEN EXPLOSION.

THE magistrates of Bremen have published a long statement of the result of the inquiry made by them into Thomas's proceedings, and they have collected many curious particulars, although they have not made any important addition to the facts which were known soon after the explosion. It appears probable that Thomas had made money by running the blockade or otherwise during the American war. He married and lived for some years comfortably, but his means were reduced by unlucky speculations, and, to retrieve his fortune, he contrived a plan of fraudulent insurance, and, when this last hope was defeated by the premature explosion, he yielded to despair and attempted suicide. The magistrates of Bremen do not know, and therefore cannot tell us, who were the confederates or what were the means on which Thomas relied to make his murderous scheme adequately profitable. Neither at Southampton nor anywhere else in England have the goods been discovered which Thomas stated were to have been sent on board the *Mosel*, nor has any trace been found of his alleged accomplice, Skidmore.

He made the acquaintance of his wife at St. Louis in 1865. He was then wealthy and popular in good society. After a short acquaintance he married her. He evaded such questions as she asked as to his previous life. They came together to Germany in January 1866. Their movements from place to place in Germany are traced from that time to the occurrence which made these movements interesting. They visited various places together, and he went to more places alone. During visits to Leipsic and Dresden he associated with the most respected American families, and there are no signs that he had communications with suspicious persons. Apparently rich, good-natured, and jovial, he was cultivated, but without success, by gamblers, and plied with begging-letters. His domestic life was on the whole happy. In 1868 he deposited with a banker at Leipsic 35,000 thalers, which he afterwards transferred to Messrs. Baring, who became his bankers in 1869. This balance in their hands gradually declined until by the end of 1873 it was only 1,619 dollars. When this sum was gone Thomas was supposed to be devoid of means, and dishonoured bills of his are now in the hands of German bankers. There is no proof that he planned the destruction of ships previous to 1875. The *City of Boston* was lost in 1870 between New York and Liverpool, but it has not been proved that Thomas had any interest in her cargo or received any of the insurance money paid on it. Early in 1873 Thomas, who then lived in Leipsic, called upon a clockmaker of that city to inquire whether he could be supplied with a noiseless clock that would run eight or ten days and then strike a single blow. The order was declined, but by the end of 1874 he had a clock made to suit him at Vienna. From this clock, as model, a large instrument was made at Bernburg, and this was destroyed in the explosion. In December 1874 Messrs. Krebs, manufacturers of dynamite, at Kalk, near Cologne, received a visit from a gentleman calling himself Garcie, of Kingston, Jamaica, who ordered a quantity of lithofracteur. Garcie was an *alias* for Thomas. In March 1875 the same person appeared at Kalk, and received seven hundred pounds of lithofracteur wrapped in parchment and packed in pasteboard boxes of five pounds each. It appears that boxes containing the lithofracteur thus obtained were brought by rail to Leipsic and placed in a storehouse rented by Thomas in the courtyard of the Hôtel de Pologne. He purchased a chest, and a journeyman cooper who assisted him saw it partly filled with small parcels in grey paper. When the chest was packed, it was sent by rail to Bremerhaven, where it was put on board the German Lloyd steamer *Rhine*, which left for New York on 5th June. The chest was stated to contain hardware. On 4th June Thomas wrote to Messrs Baring requesting them to insure for property shipped by him on board the *Rhine* value 9,000*l.*, and Messrs. Baring, on the 7th of June, informed him that they had insured accordingly, adding that they would be glad to know the nature of the property and how it was packed. To this letter no reply was sent. Thomas went to Liverpool *vid* London, and on the 10th of June embarked for New York, where he found the *Rhine* and in it his chest. It was placed in bonded warehouse for re-exportation, and being opened for this purpose Thomas declared that it contained cement. No clockwork was noticed at the hasty inspection made by the Custom-house officers on this occasion. On the 26th of June Thomas returned to England, and in August he joined his family at Dresden. About the same time he purchased a further supply of lithofracteur and some other articles of Messrs. Krebs, and had some additional apparatus made at Dresden. In October he spent a week in Liverpool, having with him two chests, two small boxes, very heavy, and a bag. He took a ticket for New York in the steamer *Celtic*. He then instructed agents to insure for him two chests full of twenty-dollar pieces, worth 6,000*l.* The Company to which the agents applied wished to have the dollars counted out before them, on which Thomas found the premium too high, and declined. He tried to effect the insurance at another Office, but the same difficulty arose. On this Thomas, with his two pretended chests of coin, which, it is said, really contained small shot, embarked in the *Celtic* for New York. It appears from the letters of Thomas's wife that this journey was not originally intended, and it is likely that he would have returned to Dresden if he had succeeded in effecting the insurance. In New York he instructed a broker to send back to Bremen by the *Rhine* the chest which had been deposited in the bonded warehouse, and he himself returned to Germany by the *Frisia*. The chest arrived at Bremerhaven on November 11, and it was sent on to Bremen, where Thomas obtained possession of it.

The preparations for the final and fatal attempt were made at Bremen. Thomas had the clock-work cleaned, and repacked his chest in a rented stable. It appears that the machinery was placed in a barrel and covered with pasteboard boxes, which, no doubt, contained lithofracteur. A workman employed to close this barrel was about to use a longer nail than Thomas intended, thinking it would be more secure. "Thomas in a great fright tore him away from his work." If he had knocked in that longer nail he would have made an end of himself and Thomas, and perhaps of part of the town of Bremen. This barrel must have been placed in the chest already mentioned, as it is known that the explosion was caused by a chest sent from Bremen to Bremerhaven, registered by Thomas for New York, and directed to "Charles J. Harvey." Thomas gave the contents as caviare, and insured it for 150*l.* The explosion reduced the contents of the chest to atoms, yet a small piece of brass was found which may have been part of the case containing the springs. The clockmaker thinks that the mechanism was hardly strong enough to retain its hold of the spring with such a concussion as a fall. It seems that Thomas intended to have sent the chest by the *Deutschland*, which left Bremen on 4th December, and was wrecked on the Kentish Knock; but he was prevented by the clockwork not being in order. On 4th December he wrote to his wife that he would be detained at Bremen another week, and added, "Oh! if I had lots of money what a good time we could now have with such pretty dear good children." He writes again to his wife on 11th December (Saturday), saying that he had made his arrangements to be at home on Thursday or Friday, to remain quietly with those he loved so much, and he added that he was going in the meantime to Hamburg. This may have been merely to conceal his intention of going to Southampton.

It appears, on the whole, that the difficulty of effecting large insurances is likely to defeat these plans for maintaining a wife and family in affluence by wholesale murder. Thomas had spent largely in two unsuccessful attempts, and a third failure would have ruined him. He had no particular malice against the passengers or crew of the *Mosel*, but he probably said to himself, "They or I must die." We cannot be sure whether he expected an explosion on board the *Rhine*; but the chest was in her, and he had insured for "property on board" to the value of 9,000*l.* He wrote to Messrs. Baring on June 4, and the steamer, with the chest, left Bremerhaven next day. When she left he must have expected to effect a remunerative insurance, and he could not know until he heard from Messrs. Baring, three or more days later, that any difficulty would arise. It seems, therefore, probable that the *Rhine* was destined to destruction, but escaped by some imperfection in the explosive mechanism. He crossed the Atlantic in another steamer, the *Republic*, and, as we have seen, reclaimed his chest. If the *Rhine* had been lost and a claim made there would have been the awkward fact against him that Messrs. Baring had asked as to the nature of the property, and had received no answer. In his second attempt both he and his machine must have been on board the *Celtic*, but he had time to make it safe before embarking. If it had not been for the troublesome desire of the underwriters to see the gold they were asked to insure, he would probably have arranged for the explosion and disappeared at the last moment. But here again there would have been suspicious circumstances to obstruct the realization of the expected profit. As regards the third attempt, we do not entirely know what he did in the way of insurance. He might have put his chest safely on board, and the clockwork might have acted at the right time and in the right way, and yet he might not have

stood to win anything beyond 150*l.* on the dangerous game. Inquiries in New York may perhaps discover important facts, but the inference at present rather seems to be that he was working alone, and so could not work effectually. There was of course always the risk that, from failure of mechanism, the explosion might not come off; but the greater risk seems to have been that it might come off unprofitably. The result, therefore, of this elaborate inquiry is to some extent satisfactory; and, now that underwriters are thoroughly warned, it would be almost impossible to effect a fraudulent insurance without leaving in their hands some clue by which the perpetrators of the fraud may be discovered. Probably the *City of Boston* perished by such a fraud; but the brilliant invention has now been considerably generalized. The difficulty lies, not in destroying a ship, but in making money out of her loss. The German police have ascertained that their compatriots perished by an explosive made at home, but to America belongs the perverted ingenuity which applied it to this murderous design.

THE OLD MASTERS AT THE ROYAL ACADEMY.

IV.

IN this concluding article we propose to give a brief sketch of the English school as seen, in unusual amplitude and variety, in the Exhibition of the present year. We have reserved till now the mention of Vandyck, because in numerous full-length portraits, such as those of "Prince Maurice of Bavaria" (104) and "Prince Rupert of Bavaria" (112), the nephews of our Charles I., we trace back to the seventeenth century a branch of art planted and patronized in England. These and other like examples are far from first-rate in quality, yet it is impossible not to admire the court-like presence, the graceful bearing, the head and turn of the heads, the pendant attitude of the hands in figures evidently posed for portraiture and posterity. Then followed a decadence so low in art and yet so exalted in self-satisfaction as to seem all but beyond redemption. Voluptuous, and after the meretricious manner of Sir Peter Lely, is the "Portrait of the Duchess of Cleveland" (24). Afterwards Sir Godfrey Kneller, a fit precursor of the Brunswick House and the Georgian era, reduced art to wood, buckram, the style of the signboard and the figure-head, as may be seen in "A Portrait signed and dated G. Kneller, fecit" (257). Yet Kneller at his best had a certain noble knock-down way of dealing with his sitters, and Reynolds, even when leading the fashion of the day, was met with the rebuke, "Ah, Reynolds, this will never answer; why, you do not paint in the least like Kneller. Shakspeare in poetry and Kneller in painting!" Sir Godfrey Kneller, wise in his generation, struck a note to which too many of our English artists down to the present day have heartily responded, when he said, "Painters of history make the dead live, and do not begin to live themselves till they are dead. I paint the living, and they make me live." Reynolds, and other Presidents of the Academy, dead and alive, have acted up to this maxim.

Hogarth was the first to bring true English character into a portrait gallery. "Peg Woffington, the Actress" (54), dressed picturesquely with wide hat edged with lace to shade a pretty face, looks a coquette, and yet a village maiden. Hogarth is here betrayed into refinement; how liquid is the colour, and how free and firm the handling! This buoyant and burlesque genius has been too exclusively regarded as a mere caricaturist; it is hardly recognized how much his satires on society owe their sting to a pencil keen as a sword, yet gentle as a feather. Offhand sketchiness, broad character, and transient action are more conspicuous in "The First Performance of the *Beggar's Opera*" (100), lent by Mr. John Murray. Allan Cunningham relates that Hogarth had a ready way of making sketches on his thumb-nail, which memoranda he was accustomed to carry home and expand at leisure. This scene from the *Beggar's Opera*, Captain Macheath singing "Which way shall I turn me? how shall I decide?" may easily have been hit off on the spot upon the ten nails of the artist's fingers. "The Portrait of the Painter's Wife" (98), who made a runaway marriage from the house of her father, Sir James Thornhill, is not painted as lovingly as might have been expected; we do not recognize in the head and bust very much of the Hogarth "line of beauty." But in these galleries the artist treads, as was his boast, in a path which lies half-way "between the sublime and the grotesque."

Reynolds next steps upon the stage; his master, Hudson, has one portrait (4), just a little above hopeless mediocrity. English art is known to have been at the lowest depth when Reynolds came to its rescue. No less than thirty pictures attest the infinite variety of the painter, the consummate art by which he captures nature in ways apparently artless. Yet the first President of the Academy has perhaps received overmuch adulation. His "Discourses," though they take rank among English classics, are behind the standard of subsequent criticism, especially in Germany and France. His own pictures are certainly not always above censure; thus the family group of "Richard and Harriet Eliot, with all their Children" (3) must be pronounced early and inartistic. We may just mention that Captain Hamilton adds to the compactness of the composition by carrying one of the younger children on his back! Nor do we think it in the best of taste that "Miss Morris" (18), though unmarried, should be portrayed in the maternal act of giving suck to an infant at her breast; the title, or excuse, however, is that "Hope nurses Love" (18). Yet the art is consummate, and a touching story, ending in early death, tells of beauty without a taint. It used to be said, and with truth, that Sir Thomas Lawrence—here represented by animated and vivid heads of men (146)—made his ladies so fine as to suggest the idea of doubtful reputations; but Reynolds, on the contrary, diffused the utmost sentimentality and refinement over sundry works such as "The Portrait of Kitty Fisher as Cleopatra dissolving the Pearl" (39). The lady is even coy; and as for the touch, the colour, the gentle and graceful flow of the lines, and the relation between the figure and the background, we can scarcely conceive of anything more tasteful or artistic. Yet, despite his aspirations after the grand manner, Reynolds at his very best was not quite Titian, and was something less than Michael Angelo. But, as a man of the world and of society, he adroitly adapted his art to his sitters; thus from "Mrs. Nisbett as Circe" (34), graceful as the Graces, he passed at his ease to "Lord Thurlow" (142), of whom it was said, at least when the Chancellor's wig was on, that no man could possibly be as wise as Lord Thurlow looked. Of course Reynolds was eclectic; yet to steal from nature is not stealing, and to steal from the Greeks is but petty larceny. The portrait of the Hon. Mrs. Bouverie (103) is Grecian in pose and cast of drapery. How much Reynolds knew of the Greeks biographers do not tell us. Possibly in this composition, evidently arranged on a classic formula, he owed somewhat to his rival, Romney, who, between Greek vases and Lady Hamilton, managed to give a composite version of neo-classic styles.

In this year's Exhibition Romney manifests supreme skill in the arrangement of graceful lines and in the modelling of lovely forms. We are pleasantly taken back to times when beauty in art went hand in hand with nature. There has never, save in classic *relievi* or in the designs of Flaxman and the hundred works of Wedgwood, been seen a composition more harmonious in proportion or in movement than what may be termed a garland of dancing children, portraits of "The five Children of the second Earl of Sutherland" (70), lent by the present Duke. Raffaelle did something akin with a circlet of dancing figures, a composition repeated by Marc Antonio and Giulio Romano. Romney must have had an exquisite sense of what may be called pictorial rhythm when he linked together the graceful and well-poised arms and hands of these pretty personations of the muse Terpsichore. But Romney invariably errs in colour—a failing all the more remarkable because his sense of relation in other respects was in balance. This may be seen by "The Portrait of Emma Lyon, or Hart, afterwards Lady Hamilton, seated at a Spinning-wheel" (240). Here is a Cenci-like pallor as of Guido, with the classic line of Flaxman in the figure; and the play of the hands about the spinning-wheel is sensitive and musical as the hands of St. Cecilia. Every one has seen countless pictorial panegyrics on this siren, but we do not remember any which so well serves to save her from the character of the courtesan. It is said that poor, infatuated Romney "had no Cassandras or Magdalens or Mirandas in his imagination" except when this lady of his idolatry was pleased to enter his studio. But the story is too old to be told afresh. Gainsborough once again is only less varied than Reynolds. Queen Charlotte and her three daughters (282–3, 4, 5) are pictures which show how nature may be aided by art. How sketchy, yet complete, is the execution; how free the hand in facile play among the hair; no line retouched or corrected. The colour, too, sometimes in Gainsborough a little crude and chalky, is here liquid and transparent; the technique also is varied, passing from a thin wash to solid impasto, as of enamel. As a rule, Royal portraits, at least since the time of Charles I. and Vandyck, prove melancholy failures, partly because the subjects are unfavourable; also because crowned heads seem to frighten artists. Never in the history of English art has there been, as is here once more made manifest, so happy a conjunction of the planets as when Reynolds, Romney, and Gainsborough rose above the horizon; yet of them it may be said that one star differeth from another star.

Some few portraits deserve to be known as well for the sitters as for the painters. We have, for example, no less than four versions of David Garrick; among National Portraits at South Kensington there were five. That by Dance, R.A. (60) is naturally the worst; the version of the character is mean. Hogarth, too, has shown bad taste, although he seizes on the versatile player in the very act of penning "The Prologue to Taste" (88). Hogarth at his best was a colourist, but here he is at his worst. From Windsor Castle comes Garrick as "Kitely," in Ben Jonson's play of *Every Man in his Humour* (57), by Reynolds. The more celebrated portrait of "Garrick between Tragedy and Comedy," by the same artist, is absent. David Garrick also fell into the hands of Gainsborough (59); Mrs. Garrick pronounced this "the best portrait ever painted of her Davie." Among other celebrities we have to record a coarsely modelled head of "Lord Byron" (233), by Phillips, R.A., lent by Mr. John Murray. Here is also an indifferent likeness of Southey (230), by Opie, R.A.; a transcript in marble of this singular countenance, keen as a razor and pert as a little thing asking a question and not pausing for a reply, stands in Bristol Cathedral. Opie, "the Cornish Boy in tin mines bred," has, by the rude naturalistic force of his hand, immortalized a "Housekeeper" (47). This master-work scarcely suffers by comparison with the massive and grandly painted head of Van Tromp (255), by Rembrandt. Opie, though supposed to have been improved by his Quakeress wife Amelia, was more of an educated mechanic than a poet. Occasionally he ventured beyond his tether, and it must be conceded that the experiment in

colour in the "Red Boy" (41) is raw and repulsive. Gainsborough showed a more sensitive eye in the parallel problem in "blue" known as the "Blue Boy."

The English school of subject compositions has comparatively few examples. Here, however, is Fuseli with a vengeance, of whose art it might be said, as of the book of a certain English divine, that it came like the law unto Moses on Mount Sinai amid thunders and lightnings. Had we not here actually before us "The Scene from *Macbeth*" (248) and "Psyche passing the Fates" (250), we should have deemed such Bedlam ravings beyond the reach of art or reason. Fuseli's writings are unjustly neglected, but it has been truly said that his genius, "like a meteor, loved to shine upon impassable places, and to lighten the darkness of that region which forms the border-land between sense and absurdity." Etty's "Storm" (261) appears supremely grand in movement and resistless power of wave. The emotion evoked is akin to that of the tempest by Giorgione in the Academy at Venice. We are at a loss to know how a plain man like Etty could, here and elsewhere, have compassed such grand conceptions. He was doubtless greatly indebted to Venice, and yet he is more than decorative. Newton, of whom we never see enough, has a skilful Dutch-like composition, rivalling, if not surpassing, Leslie, R.A.—namely, "The Vicar of Wakefield reconciling his Wife to Olivia," lent by the Marquis of Lansdowne. Of interest in several ways is Angelica Kauffmann's portrait of her ardent admirer "Sir Joshua Reynolds" (45). Yet assuredly the lady must have been much more delightful than her pictures are admirable.

The landscapes, though less important than usual, serve to illustrate the character of the English school onwards from the Anglicized-Italian style of Wilson (37). Of Crome there are seven specimens. "The Barge" (22), lent by Mr. Fuller Maitland, is, in point of composition, colour, and quality, something more than the Dutch masters, and scarcely less than Turner at his best. By Turner himself there is the literal yet romantic "View of Lowther Castle" (33), lent by the Earl of Lonsdale. As an indication of the artist's mode of work—conscientiousness and license combined—it may be interesting to know that most careful studies for the foreground trunks and foliage, exquisite in line and truthful in detail, are known to exist. Hence it happens that there is often as much to find out in a picture by Turner as in a landscape fresh from the hand of nature. Also deserving to be conned carefully are some small studies by Wilkie (26-99), and by Mulready (20); all of which prove, if proof were needed, how artists in all times have achieved greatness only at the cost of ceaseless labour. "Pre-Raffaelitism," so called, is, in fact, not peculiar to time or place; it existed long before Mr. Ruskin discovered it. The best work which we can recall by Barker of Bath—a landscape which leads us to think that he must have looked intently at old Crome—is "The Clover Field, with Woman and a Donkey in the Foreground" (69), another choice work due to Mr. Fuller Maitland. A word may be added as to a class of pictures peculiar to our English school; compositions which combine landscape with portraiture, such as the "Portrait of Lady Catherine Clinton" (263), by Reynolds, and analogous works by Gainsborough. This practice of backing up portraits by trees and fields has within the last few days been rather severely criticized by Mr. Armitage in his well-matured Lectures on Painting at the Royal Academy. But in reply it may be urged, in favour of the treatment of Reynolds and Gainsborough, not to go back to Raffaello and others, that landscape accessories let in light; the face is illumined by day; moreover, the spectator's eye is carried out into space, and thus the head and figure are not cribbed and imprisoned in a dark four-cornered space, as was the practice with the "black masters." It is but natural that landscape, an art supreme in England, should have been made the ally of portraiture. In bidding adieu to this instructive and pleasantly varied collection, we express the hope that there is no foundation for the general rumour that the present Exhibition is the last.

ANNE BOLEYN AT THE HAYMARKET THEATRE.

A CRITIC is nothing if not critical, and it may be admitted that many of the exceptions taken to Mr. Tom Taylor's new play may be justified on the assumption that a high standard of excellence ought to be imposed on him. But, looking at the matter practically, we observe that this is a much better play than *Joan of Arc*, and nearly as good as *'Twixt Axe and Crown*, which, whatever were its merits, was undoubtedly successful. It seems to be forgotten that Mr. Tom Taylor did not undertake to do more than produce a reasonably good play for a theatre which has for several seasons been lamentably deficient in successful novelties. We have so often protested against the loose, careless way in which dramatists who have once established their reputation are content to write, that it seems fair to acknowledge the merit of this play before pointing to its defects. Mr. Tom Taylor has aimed high, and he has obtained considerable, although not complete, success. It is unsafe to judge a play by a first night's performance; and, although we may wonder that he did not see beforehand that some things were unnecessary, or even absurd, yet he has seen this afterwards, and has cut these things out. No doubt the play as first performed was too long by half-an-hour; but when we hear sweeping complaints that it is "talky," and suggestions for throwing two acts into one, we feel tempted to inquire what people who are so chary of their time at the theatre do with it before or after the performance. This impatience of modern English audiences makes a great difficulty for the dramatist, who has nothing like the same scope in his work as is allowed to his brethren in France, or as was enjoyed by our own dramatists of the Elizabethan age. If Hamlet's speech, "To be, or not to be," could now be delivered for the first time at a theatre, some critic in the next day's papers would be sure to recommend that what he would call "the pruning-knife" should be applied to it. A man could probably eat as much as is good for him in twenty minutes; but it is not usually considered waste of time to prolong a dinner to an hour or more.

Let us take, in the first place, a character of this play which has received unanimous commendation. The Spanish Envoy, as represented by Mr. Arthur Cecil, is a Frenchman, and that is the only fault, if it be a fault, that can be found with him. There is not a line too much, nor a word or gesture that is not appropriate. The play would be worth seeing for this character alone, and the author not only invented it, but contrived circumstances to display it. In contrast to the subtle intrigues of Chapuis against Anne Boleyn, Mr. Howe, who has seldom appeared to such advantage, exhibits the outspoken enmity of Norfolk to the niece who has eclipsed the glory of his immediate house. Further, if we take the first act by itself, there can, we think, be no question as to its merit. "The Howard blood spoke in her there" is the best description of Anne Boleyn in this act. Whether the real Anne Boleyn could have so spoken may perhaps be doubted. But she shows herself in this act as a bright jewel fairly set. Her scorn of Percy when he shows signs of yielding his love for her to his father's threats is admirable. She would read in the heart of him whom she is to call husband two words only—"truth" and "manhood"—and, having overheard his talk with his father, she has seen to the bottom of the hearts of both. We may at least say that the spirit she shows in this scene is worthy of the mother of Queen Elizabeth; and if the purpose of the play be to exhibit the character of Anne Boleyn, real or ideal, this scene, or even the whole act, can hardly be called superfluous. When the curtain falls at the end of it, the spectator who is not pleased and interested had better perhaps depart; for, unless he can accept this treatment of the subject, he is not likely to be satisfied with what follows. Anne Boleyn is the author's heroine, and if there is too much of her in this play, it might almost be said that there is too much of Hamlet in the play which bears his name. A dramatist should have a purpose and keep to it, and then he is likely to be to some extent successful. The critics who explain to Mr. Tom Taylor what he ought to have done and how he ought to have done it may hope that he and they may live long enough to see some of their suggestions adopted in some other play.

When we observe how difficult it sometimes is to arrive at the truth in investigations of matters near our own time, we may feel only moderately interested in the attempts of historians to decide for us the question of Anne Boleyn's guilt or innocence, especially where these historians are deficient in the faculty of weighing evidence. The current belief has been that she was judicially murdered, and there is truth and force in Chapuis' remark that, between tyrannies, he prefers that which is free from forms of law. Where my great master reigns, he says,

> We look the one will naked in the face,
> And bow to it or break, and there an end.

Still it must be remembered that these forms of King Henry's time were realities before and afterwards. The Duke of Norfolk describes Anne's demeanour before the Court over which he presided; and it is strange that those who summarily condemn the fifth act should not have been moved by this picture of youth and beauty—for we will not assume innocence vainly seeking among those stern-eyed judges to find a friend. We must, however, confess to some irritation at the anti-Papist and Protestant claptrap which Anne is made to utter earlier in the play; and it may be allowed that a critic overdone with the Archbishop and the baby on the first night might pardonably yield to impatience before the curtain fell. The best answer to the charges brought against Anne after marriage is her freedom from reproach before it. She might have been the King's mistress, and she preferred to wait six years to be the King's wife. Her indecent exultation when at last the King became or thought himself free to marry her was at worst only saying what others would have been content to feel. She had the Church of Rome, the Spanish Court, and nearly half the English nation for her enemies, and we may infer, from the course of political and religious controversy in our own time, that she could have had no chance of justice between these malignant influences and the cooling passion of the King. When the Seyyid saw at Windsor Castle the portrait of this sovereign, Dr. Badger told him that that was the King who abolished the Roman Catholic religion in England. From the same point of view it might be said that Anne Boleyn was the Queen who made the Bible free. There is in the statement at least thus much of truth, that she provoked, by her patronage of Reformers, animosity which would have brought her, if it saw the chance, to disgrace and death without the least regard to her guilt or innocence of the charges made against her. As Mr. Tom Taylor says in his preface, the character and life of Anne Boleyn have been a battle-ground of religious parties, and we might add that historical truth is equally little to be expected from either side.

The modern tendency to exalt the King's character proceeds

rather from a love of paradox or a desire to show ingenuity than from religious or political partisanship; but as the King, from whatever cause, rises, the Queen must fall. We can readily believe that his subjects thought little of faults of which some modern writers have made much. He seems to have strongly held the sanctity of the marriage tie; but probably a queen, if she must choose, would rather that her husband should desert her than that he should cut off her head. As Hume puts it, this King seldom thought of any other attachment than that of marriage, and in order to attain this end he underwent more difficulties and committed greater crimes than those which he sought to avoid by forming that legal connexion. The method of King Charles II. was, on the whole, preferable to that of King Henry VIII. A libertine on the throne is better than a murderer.

Mr. Tom Taylor has been sharply criticized for violating both history and probability in this play; and therefore it deserves notice that, although he professes to have been guided by newer lights, his view of Anne Boleyn's conduct nearly agrees with that taken by Hume; and we may be sure that Hume, although he may not be the highest authority on history, would not adopt a story inconsistent with common sense. Anne, says Hume, became pregnant soon after her marriage, and this event was regarded by the people as a strong proof of the Queen's former modesty and virtue. She was married in November, 1532, or later, and she was beheaded in May, 1536. In the Tower she revealed some indiscretions and levities, which her simplicity, says Hume, equally led her to commit and to avow. Then follows a summary of this confession, in which the names of Norris, Weston, and Smeaton occur, and it reads almost like a description of certain scenes in Mr. Tom Taylor's play. The evidence against the Queen is dismissed by Hume as "palpable absurdities," which however were regarded, he says, by the peers of England as sufficient reason for sacrificing an innocent Queen to the cruelty of their tyrant. Had she been lost to all prudence and sense of shame, as was implied in the King's accusation, she must have exposed herself to detection and afforded her enemies some evidence against her. If this argument should not suffice, Hume adds another, which goes a long way. The King, he says, made the most effectual apology for her by marrying Jane Seymour the very day after Anne's execution.

This is not the place for examining Mr. Froude's history of this period, but if it be compared with that of Hume, we do not think that the older writer will suffer by the process. Mr. Froude is able to print the indictment actually found against Anne Boleyn by a grand jury, which charges her with incest with her brother, and adultery with four different persons, and all within the space of little more than two years. He also prints the names of the grand jurors, because, he says, "if the indictment was unjust, it stamps their memory with eternal infamy." But if he cannot see the extravagant and unnatural absurdity of this indictment, he wants the faculty of common sense. He would, we suppose, admit that during the earlier part of Anne's married life her husband was fond of her. She had a daughter born alive and a son born dead whom the King acknowledged, and this jury are assumed by Mr. Froude to have been capable of believing that she favoured five lovers besides her husband. The subject will not bear dwelling on, and a sufficient answer to all that Mr. Froude suggests as to the Queen's trial is supplied by what he says in reference to Sir Thomas More:—"The pageant was over, for such a trial was little more."

Mr. Tom Taylor is certainly chargeable with putting into Anne's mouth pretty much as a mere caricature for Queen Catharine which how much his satires on society owe when an author has written as a sword, yet [illegible] touches of compassion [illegible] th at which we do not believe she spoke. But [illegible] endled sig such words as

The hear[illegible] [illegible]
The guest for whom 't was ki[illegible]'s no more, [illegible]he The [illegible]fe and

it seems a pity that they should not find a place in his play. The scene in which Anne finally accepts the King is well written discreetly acted. Such lines as

Take me, my Lord, do with me as you will,
But love me ever as you love me now

may easily provoke ridicule; and the scolding-match between Anne Boleyn and Jane Seymour is even nearer to the confine of absurdity, which is quite reached when that sly young person offers some remarks on beards, founded, as she is careful to mention, on experiments made with her father and brothers only. The King of course acts on this broad hint, and it is difficult to preserve royal dignity while snatching a kiss. Mr. Harcourt seems to think that he ought to look as if he liked the fun, and very likely he is right. Miss Neilson is always equal to the occasion, and the fifth act, as it was performed on the first night, would have been laughed at if she had not kept firm hold of the sympathy of the house. She has lately played Rosalind in *As You Like It*, and although she does not come up to one of the standards of altitude therein proposed, she is undeniably "just as high as the hearts" of her audience. Mr. Tom Taylor has created or contrived a part in which she will make a deep impression. Such a play as this needs to be acted for a week or two before [illegible]

There is a funny headsman in the fifth act who protests against foreign fashions in axes, and might himself be usefully subjected to the pruning-knife. Poor Anne! she learned to dance and to dress hair in France, and there also a man was trained to cut off her head. It is probably by way of penance for a long course of burlesque that the British public is now going in generally for a scaffold hung with black for the last scene of a play. To prevent disappointment we must mention that the scaffold is not seen at the Haymarket, but only talked about. But at the St. James's Theatre there is a visible scaffold and headsman, and at the Duke's Theatre, in a new piece called *Too True*, the fire is actually lighted for burning a young woman, who is however taken off before she has even begun to simmer. The fire serves the amiable purpose of throwing a pink light upon the final and happy tableau of this piece, in which Mr. Craven, although he writes well and acts well, has not equalled his earlier work.

It is a dreadful difficulty to see how all these theatres are to be kept going, and perhaps the public would take no harm if some of them were closed. Still, when we get a play as good as this by Mr. Tom Taylor, we should be thankful. Miss Neilson cannot be always acting Juliet and Rosalind, and here is a new part in which she is well worth seeing. Thus much may be safely said. We ought to notice the "ronde" danced in Act I, and Wyatt's song "Forget not yet," as adding much to the brightness of the play.

REVIEWS.

GROTE'S FRAGMENTS ON ETHICAL SUBJECTS.*

THE name of "Fragments," as given to the work of men of letters and science, is one of ambiguous meaning. Sometimes the thing signified is that the writer is too idle, or too busy, or too disorderly in his habits, to put his work into proper shape before publishing it. Sometimes it is the very opposite of this—namely, that the writer was so highly scrupulous in his duty towards the public, so jealous for the honour of his craft, that he would not put forth as complete, or would not put forth in his lifetime at all, anything that did not bear with it the fullest judgment of his mind and the perfect workmanship of his hand. The "Fragments" now selected from Grote's papers belong to the latter class; much of the contents will bear comparison even in style and finish with other recent discussions of the same topics. The editor, who appears only by initials, but whom we need have no hesitation in recognizing as Mr. Bain, introduces these essays in a preface of almost exceeding modesty. They do not profess, it is true, to make any manifest addition of positive doctrine to the storehouse of utilitarian ethics; nor can it be said perhaps that they contain any distinctly new arguments. But that which ethical philosophy wants at present is not new matter or new arguments. There is matter enough in all the history of mankind, and there are arguments enough in all the books from Aristotle downwards. Not these, but method and grasp are the things needful; the skill that gathers scattered strength upon the right spots, the wisdom that looks through and around many sundered things till it build them into one, working *ἐς συναγυρμὸν φρονήσεως*, as Plato somewhere has it, are the gifts that will earn the best thanks in this field. Now Grote was better fitted than most men of his kind to fill such a want. With clearness of sight and strength of judgment, he had the true instinct of scientific procedure which, after all that can be said and done about inductive logic, we must take leave for the present to call incommunicable. His temper was critical without being apologetic or polemic. If time had allowed him, as we must ever regret that it did not, to pursue this quest more fully, he would have set out well armed and well warned, and would doubtless have escaped the snares into which his forerunners have more than once fallen. As it is, the beginnings he has now left us are of more worth than ordinary men's endings, and of even greater worth than we had looked for. They do much for the clearing up of thought and the fixing of directions for inquiry, which in such matters is almost half the battle; and, if the building is mostly left to be done by others, yet the ground is made ready and the lines are marked out for it. To justify this opinion fully would require comment and explanation to an extent beyond our present means; and for this very reason it seems well to say thus much before giving such account of [illegible] contents as we can give in this place.

The [illegible]tion of the first paper, which seems to have been intended for an introduction or excursus, to be used in some part of the work on Aristotle, is to answer the standing question, What is ethical sentiment? Grote justly promises that no answer can be accepted which fails to account for the divergence as well as for the agreement of the moral sentiments of mankind, such as, in fact, they are or have been at different times and places. He goes on to treat ethical sentiment as a complex product of several [illegible]ings and elements, the several existence of those elements in our feelings and motives being assumed as a plain matter of experience. The conjunction of "the benevolent and sympathetic affections" with "the self-regarding affections" makes us "capable of conceiving intense attachment to a common good—that is, to the idea of the safety and happiness of others in conjunction with our own." Moreover, every member of a society must both act, with consequences to other men, and feel the consequences of other men's actions. Thus he forms the habit of putting himself in another man's place, of saying, If I were as he how should I have acted? or, Were I a looker-on what should I think of this action of mine? This notion of the judgment of others is the base of the true ethical sentiment, into which at last it enters in more

* *Fragments on Ethical Subjects.* By the late George Grote, F.R.S. Being a Selection from his Posthumous Papers. London: Murray. 1876.

developed and complex forms, which are, first, an actual forecast, then a practical estimate, and lastly, an ideal estimate of the social judgment which will, might, or should be passed on a particular action. The sentiment accordingly is essentially social. And we arrive at a statement of the general *form* of ethical sentiment, as Grote names it:—

> All ethical sentiment, of what kind soever it be, whether perfect or imperfect, well or ill directed, uniformly contains these three ingredients:—1. The idea of a certain conduct or disposition on the part of each individual agent. 2. The idea of a certain disposition or conduct on the part of other persons towards such agent, determined by his conduct and disposition as it may have been manifested, or as there may be reason to understand it. These two ideas, intimately combined and blended together by association, conceived (3), as bound together by a common sanction, and as reciprocating one with the other, seem to constitute all that is universal, essential, and indispensable to ethical sentiment, taken as it exists in its lowest and most perverted, as well as in its purest and most correct, varieties.

This form is constant. But the matter—the kinds of conduct, namely, which in such a people at such a time are encouraged or discouraged by the social judgment—may and does vary almost indefinitely. As to resemblance, it can only be said that we generally find, in some way and to some extent, individual malevolence and cupidity restrained, and benevolence and self-command encouraged. The differences are vast, but intelligible; for in filling up the matter of ethical sentiment every people has made its own discoveries and its own mistakes; under like conditions, the discoveries and the mistakes may be and have been generically or specifically alike, and in some few capital points they have been closely alike over large tracts of time and space; the variable conditions, on the other hand, give room for endless varieties, especially in the mistakes, since there are often many ways of going wrong for one of going right. But how are we enabled to say of a people as a whole that it is *right* or *wrong* in filling up the ethical "form" in one manner rather than another? This is marked off as a separate question, and we shall come back to it afterwards. Grote then points out the philosophical error of those who consider the "matter" of ethical sentiment as prior to the "form," instead of treating them independently. It may be thought, perhaps, that these observations are commonplace; if Grote's way of approaching the question has made them seem so, that is not the least of his merits.

The leading distinctions thus indicated are more or less worked out in the second and fourth essays. It is shown that *right* has two meanings which must be kept apart. As between the individual and society, right is in the first instance that course of conduct which is enforced by the sanction of the social judgment. Positive morality, like positive law, may be analysed into right, duty or obligation, and sanction. The value of this analysis, one may remark, is in the main independent of Bentham's and Austin's use of the term *command* in their formal definition of law, which is, in truth, the definition not of an actual or possible state of things, but of an ideal limit. Nor is the line between positive law and positive morality very easy to draw, though in a civilized country they are easily distinguished in practice; Grote touches on this only too shortly. The sanction, then, is to the individual an external force overriding his own discretion. It is not the business of positive morality to show cause why this should be so; that question may well be discussed, but by some philosophy which is not properly ethical, just as the fundamental notions about space are assumed, not established, by plane geometry, and the controversy about their nature and the extent of their validity is not part of geometry. Yet we may take a step further and find the social sanction itself to be not without appeal. For it is not indifferent to us what kind of things the sanction upholds or puts down; we say that the moral precepts of such and such a people are right in sanctioning this, or wrong in sanctioning that. Here is a second order of right, as we may call it, and a class of questions which must be determined by some test of a new kind. Now, as a matter of fact, the ethical sanction and the standard of conduct set up by it are not unwavering in any man's experience. Almost or quite as soon as the child can use his reason, he learns that all men do not always deem the same things right. There are conflicts of ethical opinion in which he must needs take a side. Thus the man acquires, as a rule unconsciously, the higher notion of an ideal ethical standard on which the actual sanction would be framed if men were wise and well informed enough. He learns to conceive of morality as something which can be marred or mended on the social as well as the individual scale. Again, looking at the thing from outside and generally, we see that the social judgment and sanction is not there merely for its own sake. It has a function working to a certain end, and, according as it answers that end or not, we shall say that it works well or ill. And this end must have to do with the society as a whole, not with an individual or number of individuals; it is no other than the happiness, or rather welfare, of the society. Grote always speaks of the *society*, not the *greatest number*. It would seem, then, that the true rule of right depends in the last resort on truly knowing what are the conditions of the common weal; and thus we are brought round, in a certain sense, to the Socratic equation of virtue and knowledge. In this bare sketch we have had to leave out much even of Grote's outlines; and we must leave it to the reader to follow up the many tracks of thought into which one is led—as, for instance, to consider how near Grote comes to making a bridge between the older utilitarianism and the theory of moral sentiments put forward in Mr. Darwin's *Descent of Man*.

We must now turn very briefly to the latter part of the volume. It consists of unfinished comments and criticisms on the "Ethics" and the seventh book of the "Politics" of Aristotle. The exposition, little of it as there is, is strong and clear, like everything else that came from Grote's hand, and will no doubt be prized as a help by many students of Aristotle, whose works, and especially the "Ethics" and "Politics," have gained rather than lost in importance in the present stage of speculation. The criticisms are acute and instructive, but have the same shortcoming which is often found in the book on Plato. In dealing with ancient philosophy Grote was learned, patient, and fair-minded; but he had not the delicate sympathy which alone can do full justice to thought cast in an alien form. It is hardly worth while to judge Aristotle in the same terms as one would a modern writer for not always using a word with the same meaning, though for the student's sake it is a thing to be pointed out; and the more mechanical difficulty of making cross references when books were not printed should count for something. Again, Grote sees no foundation for Aristotle's distinction of the pleasurable sense of self-esteem that accompanies happiness from happiness itself. But this is surely to bring in the modern notion of happiness, which is not Aristotle's. For Aristotle, as for us, the pleasure of self-esteem is in consciousness, and the judgment of the conscious subject as to its existence is final; whereas in his way of speaking, though commonly not in ours, happiness is something out of consciousness, a result of definite conditions which are capable of objective estimation. To a man who perversely says, "But the things you call unpleasant please me," there is no direct answer; to him who says, "But I tell you I am happy, though you say I ought not to be," Aristotle would make answer thus:—"Nay, that you cannot tell me; your own feeling about it is only one of the facts which are to be left to the proper judge of the whole matter," this judge being the ideal reasonable observer called by Aristotle *ὁ φρόνιμος* or *σπουδαῖος*. In the essay on the "Politics," of which we must forbear to say more, the reader will find some of Aristotle's doctrines well applied to the rebuke of political commonplaces of latter days.

GENERAL ORDERS OF THE DUKE OF CUMBERLAND.*

MR. CAMPBELL-MACLACHLAN, whose previous effort as an editor and author appears to have been in part devoted to the vindication of the memory of a distinguished ancestor, has in his present compilation undertaken a more arduous and, one cannot help thinking, a less grateful, task. It was suggested to him by the circumstance that "three quaintly-bound MS. volumes" have descended to him from his maternal great-grandfather, Lieutenant (afterwards Captain) Archibald Campbell, containing the Duke of Cumberland's General Orders from April 23, 1745, to December 6, 1746, and again from April to near the end of June 1747. Of these historical documents it occurred to their possessor to make a selection which, together with notes, comments, and illustrations derived from other sources, he has printed in a volume bound, if not quaintly, at all events queerly. The noble art of bookbinding seems at the present day to be agitated by an ambition which occasionally overleaps itself; with regard to the sample before us, we sincerely hope to be pardoned for our ignorance as to whether it is intended to symbolize the uniform of a field-marshal or the livery of the humbler members of the Royal household.

A similar feeling of uncertainty, we must confess, remains with us after a perusal of the pages within this gorgeous cover. It must be a delightful thing to be the proprietor of a connected series of documents illustrating a period of history, and treating of a department of public affairs in which one takes an hereditary interest; and the desire to communicate the good things one possesses is at once a natural and a pleasing instinct. An industrious accumulation of notes adds value to the documents in the eyes of their possessor, and may promise to make them more interesting in the eyes of the public when admitted to an acquaintance with his treasures. Finally, it is impossible that he should fail to form an opinion of his own concerning the more general conclusions to be drawn from the data he has so long surveyed and re-surveyed, and it is quite intelligible that he should wish his opinions to go forth to the world together with the materials which have helped him to form them. But historical documents, however genuine, and personal opinions, however sincere, have only a relative value after all; and a faculty usually termed discrimination is needed to determine whether that value is such as to justify the publication of either.

Had Mr. Campbell-Maclachlan thought fit to publish the entire series of General Orders in his possession, to accompany them with such notes as his own industry could supply, and to prefix to the whole a preface or introduction indicating the bearing of his collection upon the historical questions connected with the Duke of Cumberland's military career during the period to which the Orders belong, he would have performed a service of no very great, but still of indisputable, value. Had he even pursued the same plan while limiting himself to a selection guided by certain principles definitely stated, his book would have filled its modest place. But he has taken a different course, which it is not very easy to describe clearly. The General Orders were the *raison d'être* of his book, and, as he candidly states, constitute its sub-

* *William Augustus, Duke of Cumberland; being a Sketch of his Military Life and Character, chiefly as exhibited in the General Orders of H.R.H., 1745-1747.* By Archibald Neil Campbell-Maclachlan, &c. &c. London: Henry S. King & Co. 1876.

stance. But he seems at the same time to have conceived the ambition of presenting a "sketch of the military life and character" of the hero of Culloden, though the (doubtless unintentional) ambiguity of the phrase leaves it open to question whether it is the military life and military character or the military life and the character in general of the Duke of which he designed to attempt an outline. In either case the result, as we will immediately show, has fallen short of what could be called success. On the other hand, he has sought to indicate certain conclusions as to the accusations under which the Duke of Cumberland's name suffers to this day. He has here in one respect adduced evidence worthy of attentive consideration, but he has abstained from any endeavour to treat the subject with anything like completeness, and has therefore left the question in no essentially different position from that in which it has hitherto stood.

We regret to speak in such terms of a book which shows so much industry on the author's part, so much love of his subject, and so much honourable feeling, worthy at once of his clerical profession and of his descent from a line of gallant ancestors. These features entitle his book to decent burial at the hands of the general reader, while the student of military affairs may find in it some details of interest, though unlikely to prove of high value to the Intelligence Department of the British army. Unfortunately, there is no index to render access to these details more easy. Mr. Campbell-Maclachlan has accumulated numerous biographical data concerning the members of the Duke's staff, personal, cavalry, and infantry, but he has not facilitated reference to these in a way which would have cost little additional trouble. And yet he is a reader of Mr. Carlyle, whose love of a good index alone should commend him as an example to every author of biography. In lieu of so indispensable an adjunct, Mr. Campbell-Maclachlan is profuse in that more or less obsolete species of ornament—quotations at the head of a chapter. Chapter I. has merely a passage from Wordsworth prefixed to it, and Chapter II. Mr. Carlyle's label of the "Martial Boy"; but when we come to Chapter III. and Fontenoy, an array of quotations in prose and verse stops us on the threshold, including the following singularly suggestive passage from *The Antiquary*:—

> D'ye no mind Fontenoy?

But the climax is reached with Culloden, for whose "woeful day" (of which Mr. Campbell-Maclachlan himself modestly professes to give no descriptive account whatever except such as is furnished by a plan of the Highland line of battle copied from a page of his MS.) we are prepared by extracts from a Jacobite song, Burns, Collins, Mrs. Grant of Laggan, Campbell, Aytoun, and (*fatidis descensus*) John Adams, author of the Newdigate of 1847. The editor is too manifestly one of those victims of what the Germans call *Citirsucht*, who in the hour of composition are unable to sacrifice a single item of their *collectanea*; for even in the body of his work he is always quoting, and quoting at length, from history and fiction, and from the most accessible as well as from more recondite sources, till one begins to wonder whether his book might not be said to have been quilted rather than composed. Worse than this is his habit of going backwards and forwards, fighting his battles over and over again, and doing his best to confound the best-intentioned attempt to maintain a view of the chronological sequence of the events with which he has to deal.

The Duke of Cumberland, we are reminded by a quotation—this time from a Budget speech by Mr. Lowe—"always said that he had been most unjustly praised for his victory at Culloden, and most unjustly depreciated for his capitulation at Closterseven, so that upon the whole he considered justice had been done to him." Neither side of the balance, however, is examined in the volume before us; for of the battle of Culloden the editor, as we have said, declines to give an account, and his collection of General Orders comes to an end before the defeat of Lauffeld, the last battle in which the Duke commanded a British army. What the collection illustrates is the system of discipline and military administration pursued by the Duke of Cumberland during a period which includes Fontenoy and Culloden, and takes in the earlier part of the Dutch campaign of 1747. The preliminary account of the battle of Fontenoy contains nothing new, Mr. Hayward having sufficiently exposed the time-honoured myth about the reciprocal courtesies of the English and the French Guards, and M. Alphonse Karr's *jeu d'esprit* on the want of chivalry in modern warfare not constituting a novelty of much significance. From the first series of General Orders we glean a few facts, while we are treated to a few notes into the bargain, such as a perfunctory passage from Murray's *Handbook* concerning the citadel of Ghent, and the observation that it is interesting to note in one of the Orders, as "marks of authenticity and proofs of accuracy," the use of two real Flemish words. The note on the "Blew-Guard" reminds us of the fact that the "Oxford Blues," as the Royal Horse Guards were originally called, derived their name from the Earl of Oxford, who raised them in 1661, and whose colours they accordingly wore, and perhaps suggested in later times to champions of the University. A series of Orders on the duties of regimental chaplains, which duties seem to have been at times neglected, suggests to Mr. Campbell-Maclachlan the reflection that the author of the *Night Thoughts*, who served as an army chaplain in Flanders under the Duke, "must have done something to raise the tone of his brethren." An anecdote and appropriate quotation follow, and after some more not inapposite talk about chaplains and Methodists, and about swearing in Flanders and at home, the General Orders are resumed. A series of notes concerning the original meaning of the term "grenadiers" may interest those who are unacquainted with this tolerably trite subject of military archæology; but in this section of the General Orders themselves there is nothing that strikes us as worthy of notice, except it be the paroles. They seem invariably to have consisted of the name of a saint and of some place under his or her more immediate patronage, combined thus; "St. Anne et Bruges," "St. Jaques et Compostolle," "St. Gudule et Bruxelles"; and we confess that we should have been glad of a note as to the origin and use of this particular class of watchword. Thus we are brought up to Fontenoy once more, and pause with the author to peruse such data as he has succeeded in collecting with regard to the members of the Duke's staff. Horace Walpole supplies most of them, as is not surprising when we have to do with such names as Captain (afterwards General) Conway and General Ligonier, whose later personal relations with the Duke of Cumberland were so far from pleasant. Another personage of interest is General St. Clair, afterwards the friend and chief of Hume, and unceremoniously described by Horace Walpole as "Scotchissimè in all the latitude of the word, and not very able."

The chapter headed "Results of the Battle of Fontenoy" gives a further series of extracts from the General Orders, and contains several details worth noticing. Among them is the passage instructing "all the officers to provide themselves with spontoons"—an arm which was about this time substituted for the half-pike. In the next page are two Orders illustrating, in the editor's opinion, the nice sense of honour which "has ever been a distinguishing characteristic of the English gentleman and officer." We quote them at length:—

> Camp of Lessines, May 20th.
>
> The present Genl Court Martial to continue sitting to examine Lt Collis and Lt Sampson of Br Johnson's Regt (3rd) at their own desire on a report spread by Mr. Crosley, Surgeon's Mate to the said Corps, to their disadvantage. The 2 Genll and the said Mr. Crosley to attend ye Court Martial to-morrow morning at 8 o'clock at ye Head Quarts wh their witnesses.
>
> And then, May 26th, we have the result of the inquiry:—
>
> Jedh Crosley Surgn's mate to Brigr Johnson's Regt to be cashiered, and turned out of both Camps of the British Army, wh a Halter about his neck, and not return upon pain, either in Camp or Garrison, on pain of severe punishment, for having unjustly and ignominiously aspers'd ye character of Lieut. Sampson and Lieut. Collis.

The strictest discipline appears to have been applied to that most wretched class of human beings, female camp-followers—a circumstance which it is necessary to bear in mind for a more critical point in the volume. Gaming too, *among the men*, was sternly prohibited. But the severest vigilance was necessary against the worst of all military crimes—desertion—to which, as Mr. Campbell-Maclachlan points out, the presence of so many Irish regiments in the French ranks lent peculiar facilities. It subsequently appears that desertion was likewise rife during the northern campaigns of the Duke of Cumberland.

Mutatis mutandis, there is nothing in these General Orders to distinguish them from those which are issued by every commander of a force in a foreign country. They show, however, that the Duke was a strict disciplinarian, and make it *à priori* unlikely that the rules of discipline should have been relaxed by him further than was inevitable, even after the important victory which he achieved in the second of his campaigns, the last which is at any length illustrated by the documents cited in this book. The capture of a town may render it temporarily impossible for even a Duke of Wellington to keep control over his soldiery, but such was not the situation after Culloden. Yet it has been asserted that in the proceedings which followed upon that victory, and which earned for the Duke of Cumberland the horrible *sobriquet* which the popular voice has substituted for the frigid allegory on the Culloden medal, he allowed the evil passions of his troops their own course; and we find a temperate writer like Lord Stanhope stating that "every kind of havoc and outrage was not only permitted, but, I fear we must add, encouraged. Military license usurped the place of law, and a fierce and exasperated soldiery were at once judge, jury, executioner." Lord Stanhope allows for the probability of exaggeration on the part of the Jacobites, but thinks the specific cases of barbarous cruelty established on incontestable proof.

It would have been no pleasant task, but it might not have been a useless one, to inquire once more into the whole matter of the acts of the troops after Culloden, and of the extent of the responsibility attaching to their commander, especially since the time has passed when it was necessary to imitate the *Quarterly* Reviewer of the *Culloden Papers* in 1816, and draw a veil over the conduct of the Duke of Cumberland, "out of no respect or tenderness to the memory of that Prince, but in justice to the far different sentiments of many members of his illustrious family." Mr. Campbell-Maclachlan, however, has abstained from any systematic research of the kind. He quotes the rhetorical assertions of Chambers that "Duke William and his myrmidons spent their time in a round of festivities," and that "their camp exhibited all the coarse and obstreperous revelries of an English fair," and makes special reference to one particular story, a thousand times repeated, but too loathsome to repeat once more. The fidelity to truth of the more general assertions may, he thinks, be tested by the General Orders issued from day to day and cited by him. These Orders certainly show that stringent measures were taken to preserve discipline among the troops themselves, to prevent "plundering on any account except by Order and in Presence of an officer," and to stop gaming among the men.

But we fail to see that this, though it proves something, proves much; and in particular, we cannot understand how the prohibition of gaming, and the denial to the men of taking and using horses for themselves, place out of question the truth of the story about the horse-races to which Mr. Campbell Maclachlan more than once refers. On the head of cruelty he has no desire to make a defence for the Duke. The Order dated "Inverness, April 17th," expressly bids the "officer and men" who are instructed to search the neighbourhood of the battle-field for rebels, to "take notice that the publick orders of the Rebels yesterday were to give us no quarter." The moral is sufficiently obvious. The Order dated "Fort Augustus, July 8th," which prohibits the sale or gift of meal "to any Highlander or any person of the country," under penalty of whipping and arrest of a stringent character, and the Order issued three days afterwards, for driving south all the cattle not taken for the use of the army, he stigmatizes with the remark:—

> There is a savour of hard-heartedness in the following "Orders," it must be allowed, justifying some of the worst charges brought against the Duke, in waging war not alone against men in open fight, but their helpless families also.

He has, however, clearly proved that serious and repeated attempts, at all events, were made to prevent all marauding and illicit plundering, for which, as he truly observes, there was the less excuse "when such liberal gifts were constantly being distributed among" the soldiers. We are therefore of opinion that a closer examination of the evidence would probably lead to a fairer judgment of the conduct of the Duke from this particular point of view; and, having said so much, we honestly believe we have summed up the service which has been rendered to his memory by the editor of his "General Orders." The concluding chapter of the work, on the Campaign in Holland of 1747, contains nothing of interest. Why, by the by, does Mr. Campbell-Maclachlan, in an earlier chapter, follow the historian of the Black Watch in calling Waldeck—or De Waldeck, as he is here named—a "Dutch Prince." It is not everybody who would gather from this that the person referred to was a German and a prince of the Empire, which he served as Field-Marshal-General.

HAYDON'S CORRESPONDENCE AND TABLE-TALK.*

"MORE than twenty years," says Mr. F. W. Haydon in his preface, "have been allowed to elapse since the publication of the fragment of unrevised and carelessly written autobiography Haydon left behind him. The time appears to have come for a further selection from his Journals and Correspondence." This is a statement which is open to question. However carelessly written Haydon's *Autobiography* may have been, it was far from carelessly edited by Mr. Tom Taylor. It is natural enough that Mr. F. W. Haydon should have thought it desirable to give to the world further information about Haydon's doings and sufferings; and it is perhaps also natural that his discretion should not be equal to that of Haydon's former biographer. The task of curtailing and selecting must of necessity be exceptionally difficult to a son dealing with his father's memoirs; and one could readily forgive some superfluity of matter for the sake of gaining fresh information about a man who did much for the interests of art in England. But the truth is that there is not much to be learned from the two volumes now published which Mr. Tom Taylor had not told before. Most of the good things in the Table-Talk had been already selected by him, as had the most valuable letter—that from Keats containing two sets of verses—in the Correspondence. A habit has of late years grown up of collecting and publishing every scrap, valuable or valueless, connected with the lives of men of mark. Such a practice is more likely to injure than glorify the memory of the men to whom it is applied; and, though there is nothing in the volumes under consideration which can hurt Haydon's reputation, yet there is very much that is tiresome, and not a little that a more careful discretion would have caused to be omitted. Again, though Mr. F. W. Haydon has in his preface given excuses for the faults in his performance of which he is conscious, and though he is careful to state that he is "neither a 'Painter' nor a 'Literary' man," yet we cannot but think he might have paid more attention to the grammatical construction of his sentences. His carelessness is the stranger as there is evidence in the book that its author's reading has been tolerably wide.

"The position Haydon took up in art" (we are quoting from his present biographer's preface) "from his entrance into London society in 1804 down to his death in 1846, has not been sufficiently understood. It was peculiar and original. It was in defence of the capacity of the English people for Fine Art." At the beginning of this century it was generally supposed among Englishmen of education that their country was incapable of producing imaginative artists. This mistaken belief Haydon combated with never-failing vigour and perseverance; and furthermore, as Mr. Tom Taylor has said, "he was the first artist who got a hearing in his insisting to the Government and public of England that art is a matter of national concern. Before his time no one had urged this truth except the passionate and cynical Barry." That Haydon was the first man who started the movement which is now going on in favour of art education should always be remembered; but there is perhaps more danger of this being forgotten than the fact that, by his determined and courageous opposition to a clique whose influence was unfortunately out of all proportion to its taste, he secured the possession of the Elgin Marbles to his country. After Payne Knight had, with shallow assurance, settled that the marbles were not Greek at all, but Roman of the time of Hadrian, a Government Committee was appointed "to inquire," and decide upon the purchase or rejection of the marbles. West, Lawrence, Nollekens, Flaxman, and Westmacott spoke in different terms of praise of the marbles. Lawrence said he considered them "examples of the highest style of art, of essential importance to art, and particularly to historical painting." Payne Knight, Lord Aberdeen, and others spoke in a contrary sense; Payne Knight asserted that Lord Lansdowne's Venus and Mercury were either of them worth any two of the articles in Lord Elgin's collection, that the Theseus was spurious and the rest very poor. When it came to the time for Haydon, who was Lord Elgin's professional witness, to be examined, the Committee put him off on various excuses for three days. At last Mr. Bankes informed Lord Elgin that "Mr. Haydon would not be examined, out of delicacy to Mr. Payne Knight," whom he had before this attacked. Thereupon Haydon said that he would make Knight remember the Elgin Marbles as long as he lived, and composed the article for the *Examiner* and the *Champion*, which, as we learn from his *Autobiography*, was written in his painting-room with his picture of Jerusalem before him, entitled, "On the Judgment of Connoisseurs being preferre to that of Professional Men—the Elgin Marbles," &c. This letter was the best thing that Haydon ever did with his pen; it carried conviction with it. It is not a little disappointing to find only the heading of the letter given in Mr. F. W. Haydon's volumes, and this is the more singular as it is quoted at length by Mr. Tom Taylor in his Life of Haydon. The letter had the effect which from its truth and force it could hardly fail to have. Lawrence said of it, "It has saved the Marbles, but it will ruin Haydon." And his perception was but too accurate. The letter found its way into France, Italy, and Germany. Goethe and Bunsen spoke of it with delight. What impression it made upon men who were wise in the ways of the world here may be judged from this passage in Mr. Tom Taylor's edition of the *Autobiography*:—

> Lord Mulgrave, always regarding me, had at the very moment the letter appeared laid a plan before the directors of the institution to send me out to Italy. It would have been done, but the moment the letter appeared he sent for a friend. "What the devil is Haydon about?" "Upon my soul I don't know, my lord." "Here have I been planning to get him a handsome income for three years, and send him to Italy, and out comes this indiscreet, abominable letter."

Although it is by no means impossible nowadays for one man without any knowledge or taste in art to exercise a considerable jurisdiction in artistic matters, still the ultimate result to himself of Haydon's letter might, we may hope, in our time have been different from what it then was. The fact of his publishing it and so incurring what he must have known to be a great chance of disfavour in quarters where advancement was necessary to him, is in itself answer enough to the assertion, of which Mr. F. W. Haydon speaks with just indignation, that he followed art for his own personal gratification and advancement. The immediate effect of the letter as far as regarded himself was that he became a hon. He was called upon by the great, and beset with all kinds of applications from the little. The art students idolized him. His private friends addressed him in extravagant verse. "Wordsworth and Keats," says Mr. F. W. Haydon, "were the only two who kept their judgment and wrote something sensible." And he makes a good remark upon the adulation of the zealous friends who surround the idol of a minute:—"They always are so ardent, kind, and enthusiastic about their hero; they are very likely with the best intentions to prove his worst enemies. But they get some little fame themselves by admiring what they cannot do."

This victory, won single-handed in the cause of art against great odds, was perhaps the most important deed of Haydon's life. And in it comes out most strongly the real love for art that first induced him, in the face of many difficulties, to become a painter. The account of his genealogy, given in Mr. F. W. Haydon's Memoir, is hopelessly confusing; but it appears that from his mother, whose maiden name was Cobley, and who was well connected in various ways, amongst others with the Mordwinoff family in Russia, Haydon inherited his quick perception and temper. As a boy he took to drawing, and it is recorded that in one of his early attempts, at a portrait of an officer, he put his subject's eyes into his forehead, and joined his legs on to his neck. While at the Plymouth Grammar School, however, he began to draw correctly, and under the guidance of a Neapolitan named Fenzi, employed in his father's business, he first got the notion, which he afterwards clung to pertinaciously, that the great thing to be cultivated was drawing the human figure. As he began to grow up it was fully intended by his father that Haydon should succeed to the family business; and it was fully intended by Haydon that, instead of doing so, he should become a painter. There was a disturbance in the family, during which the boy fell ill. "When he rallied he had greatly lost his natural sight, and was ever afterwards compelled to wear spectacles. Some of the family regarded this as a judgment of Providence for his ingratitude."

---

* *Benjamin Robert Haydon: Correspondence and Table-Talk* With a Memoir by his Son, Frederick Wordsworth Haydon. With Facsimile Illustrations from his Journals. 2 vols. London: Chatto & Windus. 1876.

Undaunted, however, by the affection of his sight and the opposition of his family Haydon remained fixed in his intention, and in May, 1804, began to carry it out by going up to London. Here he called upon painters to whom he had introductions, among others Northcote and Opie, who gave him exactly opposite advice, and ultimately he became a student at the Academy. A year after his arrival in town things so fell out that he was started definitively to make his own way as best he could in the career he had chosen. He found in the next few years patrons in Lord Mulgrave and Sir George Beaumont, and friends in Wilkie, Leigh Hunt, and his brother. His first important picture, "Joseph and Mary," was hung on the line of the Academy Exhibition in 1807 by Fuseli's orders. "Dentatus," painted on commission for Lord Mulgrave, and sent in the next year, was also in the first instance hung on the line. But during Fuseli's absence from town it was taken down and hung in the octagon room, which was practically a dark corner. In 1809, Wilkie and a painter named Dawe were elected Associates of the Academy, while Haydon was rejected. A year or two later, in consequence, Mr. F. W. Haydon says, of the Bird and Wilkie case, Haydon resolved to have no official connexion with the Academy. Into the merits of the differences between Haydon and the Academicians we need not here enter, but the letters which Haydon published in the *Examiner*, in the early part of 1812, signed "An English Student," put an end to any chance of a reconciliation between him and the Academy. Not only this, but, as Mr. F. W. Haydon writes, "he awoke one morning to find himself a man forbid, and all his reputation gone." There came upon him difficulties with regard to the large picture of "Macbeth" ordered by Sir George Beaumont, and the "Judgment of Solomon," which, disregarding Wilkie's advice to send it to the Royal Academy as a kind of peace offering, Haydon sent to the Water Colour Society. On the private day, the Princess Charlotte of Wales, accompanied by Payne Knight, looked at the picture. Payne Knight dismissed it as "distorted stuff," and the Princess, observing to the Directors "I am very sorry to see such a picture here," walked away. The public, however, thought differently; and one result of the exhibition was that overtures were made by the Academy to Haydon, who, with the want of wisdom which ran through his life, rejected them. Between this date and the exhibition of his next large picture came the Elgin Marbles controversy; and in 1816 the successful exhibition of his pupils' copies from the Raffaelle Cartoons seemed to establish Haydon's position. But endless difficulties—many, it must be admitted, of his own making—were in his way. In the next year he had a fresh disagreement with the Academy; he was constantly hampered with debt; and in whatever estimation the public might hold his ambitious pictures, he could never persuade those in authority to give him the employment he sought as a painter of historical subjects for the nation. It was in 1816 that he received a letter from his uncle, Count Mordwinoff, containing some excellent advice, written in less excellent French, which we cannot but wish he had followed:—

> Votre fortune est toute dans votre pinceau, et vous devez la faire encore. Votre "Solomon" ne vous a pas rendu riche; il vous a procuré de la célébrité, et vous a bien servi pour vous mettre dans la voie de la richesse, qui est toujours bonne, même pour un homme de talent. Je vous aurais conseillé de faire à présent des tableaux de deux à trois figures, comme mon "Adam et Eve," et plus de la grandeur de ceux qu'on place dans les cabinets. Si Raphaël et Buonarotti ne faisaient que la "Transfiguration" et le "Dernier Jugement," ils seraient moins célèbres et moins connus. Mais leurs noms et leurs mérites sont connus dans toute l'Europe, parce qu'ils firent des tableaux portables d'un pays à l'autre, et que chaque pays les possède à présent.

But on a man so infatuated with huge canvases as Haydon such advice was thrown away. In 1820 he began the "Raising of Lazarus," which in 1823 was exhibited. In April of that year an execution was put in, the "Lazarus" was seized, and Haydon was taken to the King's Bench. In July of the same year, when he was discharged by the Commissioners, there being no opposition, what Mr. F. W. Haydon takes as the second period of his career came to a close.

The third period is the most cheerless, and it seems the less necessary to go into any detailed account of it, as its latest history adds little to what was known of it before Mr. F. W. Haydon's volumes appeared. It is the history of a man with undoubtedly great views, which he attempted to reach by the most mistaken methods; who went through vast miseries—due in great measure to his blind striving towards a phantom goal—which culminated in mental disturbance and suicide. When one reads of Haydon's sufferings it is perhaps not difficult to understand the vehemence into which his later biographer is betrayed; but at the same time it must be said that Mr. F. W. Haydon does not always fulfil the promise of impartiality, as far as may be, which he gives in his preface. When Haydon was in great distress, having lost a large sum by the exhibition of pictures which aimed at high art, and which the public neglected for the more popular attraction of a fashionable dwarf, he wrote to Sir Robert Peel, then Prime Minister, for assistance. Sir Robert, says Mr. F. W. Haydon, "in the midst of all his Corn Law debates, replies promptly, though in a formal letter, enclosing an official order for 50*l.* on a fund over which, as Prime Minister, he had official control." Mr. F. W. Haydon goes on to find fault with this gift, in a lengthy paragraph, on the ground that it was to a man in Haydon's situation "the merest illusion in the world," and was public instead of private money. Haydon himself, however, in his diary, as given at p. 317 of Mr. Tom Taylor's third volume, writes, after copying Sir Robert Peel's letter, "And this Peel is the man who has no heart." As Mr. F. W. Haydon has taken occasion more than once to speak with little liking of Sir Robert Peel's dealings with Haydon, it seems worth while to quote another passage from the painter's journal found in the same volume of the *Autobiography*:—"They may say what they like of Peel; he has a good, a tender, and a feeling heart."

It has been already said that the mass of matter in the "Correspondence and Table Talk" is out of proportion to the interest found in it. The work is further overburdened by editorial footnotes which might have been omitted with advantage. Some of the facsimile sketches introduced are valuable; but the arrangement is for the most part chaotic. Mr. F. W. Haydon's volumes cannot be considered a desirable addition to literature.

DAVIES'S BIBLE ENGLISH.*

THIS is really a very good and sensible little book. It makes no very great professions; but it fully carries out what it does profess. It is hardly philological; but it was hardly called on to be philological. And, amid the frightful temptations to preaching which must have beset Mr. Davies in treating such a subject, it is wonderful how very little he preaches. He certainly does not preach so much as Archbishop Trench in a case which was somewhat similar, though the Archbishop's subject came nearer to philology proper than that which is taken in hand by Mr. Davies. In short, when we see the history of Mr. Davies's book, how it grew out of a paper read at a "clerical meeting" and went through the intermediate stage of articles in a "Parish Magazine," our ideas of clerical meetings and parish magazines are distinctly raised. Mr. Davies has worked really well at his subject, and has put his matter together in a shape both useful and pleasant. His plan of classing words together, so as to make something which can be read, and not merely referred to, is decidedly better than the alphabetical arrangement which he speaks of as followed in another work on the same subject. Mr. Davies's practical object in the clerical meeting and the parish magazine was doubtless to help to the better understanding of the English Bible and Prayer-book. His labours, in their present shape, amount to a chapter in the history of the English language—namely, the changes in the use of words which have happened since the sixteenth century. He takes such words as are used in the Bible and Prayer-book, but which are now gone out of use or used in a different meaning; he compares their use in writers contemporary with the Bible and Prayer-book, and marks the differences of usage in modern times. This has of course involved a good deal of reading among the writers of the sixteenth and seventeenth centuries; but it does not necessarily involve any work among earlier times. Mr. Davies takes the use of each word in the sixteenth century as his starting-point. He has sometimes incidentally to speak of the earlier use of a word or of its actual philological origin; but this is only incidentally; such inquiries do not form part of his immediate subject. When he does make such incidental references, they are commonly to the point, though once or twice he seems to put more faith than enough in Mr. Hensleigh Wedgwood. If there is any point on which we could have wished Mr. Davies to be a little fuller, it would be in the later history of the words which he deals with; for that is clearly part of his subject. Sometimes he takes a leap from the former half of the seventeenth century to the latter half of the nineteenth, when a sketch of the history of the word during the intermediate stages would often have been instructive.

Mr. Davies, we are glad to see, thoroughly understands the merits of the authorized version of the Bible as a piece of English, and the care which must be taken in any revision not to do any harm to it in that character. Certainly in no case is there more need to work warily. The version as a whole is such an admirable specimen of our language, it is so good in itself, it is so endeared by associations, it so exactly hits the right mean—archaic enough to be venerable, but not archaic enough to be unintelligible—that no one word should be touched without some very weighty reason. It must be a really important departure from the meaning of the original—of which beyond doubt there are some cases—which alone can justify any change. Every one knows that the newer translation of the Psalms in our Bibles is a far better representation of the Hebrew than the earlier translation in our Prayer-books; several passages which are near upon nonsense in the one become perfectly clear in the other. Still few, we should think, would wish to bring the later translation into use in divine service. For the object of a psalm is to be sung, and the earlier version is made to be sung, and the later is not. So in the whole work it would be better to put up with a mistranslation here and there, provided the reader is not likely to be greatly led astray, than at all to injure the general run of the English style of the English Bible. And it is worth notice that, in many of the cases where the meaning is most commonly misunderstood, the fault in no way lies with the translators. Thus, to take two instances which we remember having spoken of ourselves, it is in no way owing to the translation that people will misunderstand the story of Gallio, and will preach at the unlucky deputy—Mr. Davies takes care to call to mind the dignity of his office and the dignity of his title when our version was made—on

---

* *Bible English. Chapters on Old and Disused Expressions in the Authorized Version of the Scriptures and the Book of Common Prayer.* By the Rev. T. Lewis O. Davies, M.A. London: Bell & Sons. 1875.

grounds which neither he nor the Evangelist would have understood. So the popular misunderstanding about Pharaoh is in a certain sense due to the translators, but only to our translators in common with all other translators from the Septuagint onwards. That is, it is owing to the universal feeling against the employment, except on very rare occasions, of the proper name of Deity. So again, if people will fancy that the same Pharaoh was drowned in the Red Sea, which is certainly nowhere said in the narrative in Exodus, that too is no fault of the translators. Or, to take another cant phrase of sermons about "the one thing needful," the meaning of the original is so far from being perfectly clear that the translators were perhaps right in not making their translation over-clear either. To go down to a lower depth, no care of translators, revisers, or commentators can grapple with the state of mind which confounds Pharisees and fairies. But when we find *τοὺς σωζομένους* turned into "such as should be saved," then we must for once give our translators up.

While on the question of style, we may mention, not a beacon, but a warning, to which Mr. Davies calls our notice more than once. This is the way in which changes have been made in the American Prayer-book, sometimes plainly from a kind of false delicacy, sometimes, it would seem, from a real dislike to trifling archaisms which could not possibly perplex anybody. It does seem amazing that any Synod or Convention should have taken the trouble to sit down and change "them" into "those" in the General Confession. Such a change can really serve no purpose, except to bring a fine piece of good old alliterative English one degree nearer to the language of a New York paper. And, as any one who has compared the two Prayer-books knows, the American book is full of small changes of this kind, which, if they do nothing else, commonly destroy some little bit of well-constructed rhythm. Any revisers, either of Bible or Prayer-book, should keep this kind of thing before them, as a specimen of the way in which they should not go.

In going through Mr. Davies's chapters, it sometimes strikes us that he has marked phrases as obsolete or unfamiliar which seem to us to come quite naturally to the mouth or the pen. But Mr. Davies, rightly enough, is prepared for this kind of criticism, and remarks "that there are many words which occupy debatable ground, so that what one person may consider to be tinged with archaism, another, living perhaps in a different part of England, will regard as perfectly plain and common." Living in different parts of England may perhaps have something to do with it; but we suspect that difference of taste and habit has a good deal more. One man is well pleased to make his language as archaic as he can without becoming unintelligible; another flies off by choice to the newest thing in the *Daily Telegraph*. But it is better, with Mr. Davies, to mark all things which anybody can possibly look on as archaic, rather than to leave out any of whose archaism there can be no doubt. We could wish however that he had somewhere found a corner to brand the modern fashion by which the good word "jeopard," which will be found in the song of Deborah, has been changed into the barbarous, ugly, and utterly needless "jeopardize." Printers, in their zeal for improvement, will, if any one so far jeopards himself as to use the real word, go and turn it into the sham.

In Mr. Davies's classification, besides peculiarities of form and peculiarities of construction and words relating to armour and dress, which get chapters to themselves, he divides the words of which he speaks into words which have lost some of their powers, words whose sense has risen or fallen, has become wider or narrower, and words which have become wholly obsolete. Yet many of these last are used by Shakspeare, Spenser, and Bacon. Mr. Davies takes a good deal of pains very profitably to compare the language of the translation with the language of those writers and of others of their time, and he examines a remark of Hallam that the English of the Bible "may in the eyes of many be a better English, but it is not the English of Daniel, Raleigh, or Bacon." Of the fact there is no doubt: Mr. Davies goes a little further into the causes of the fact. He reminds us that King James's translation was not an absolutely new translation; the translators were bidden to take the older Bishops' Bible as the groundwork, and not to depart from it without some clear reason. This alone would make the language of the translation somewhat different from the contemporary language of books. Mr. Davies also suggests the feeling, which probably would have some weight, that such a work as the translation of the Bible should purposely have something of an archaic character. But besides this, we must remember that the translators were not literary men in the same sense as Raleigh and Bacon. They were scholars and divines of no mean order, but perhaps none of them was likely to leave behind him writings which would have been preserved for their form only. And if we turn to such a book as Bishop Godwin's Catalogue of Bishops, we shall see that there were writers whose style was far more unlike that of the contemporary masters of literature than the style of the translators of the Bible. Mr. Davies has something to say of the tricks which printers have played with the text of the Bible. Some of these are well known, but perhaps the most grotesque is where the Moabite town of Madmen was addressed as "thee"; so the printers changed it into "Maiden," thinking that *madmen* must needs be plural. Mr. Davies has also something to say about the number of words, some of which seem to be vulgar, some to be inaccurate, and some to be actually modern slang, which can quote good authority in the translation of the Bible, and in other good writings of the same date or earlier. But he perhaps goes too far when, in p. 50, he puts together a long sentence made out of such words, because, though any one of them might be found by itself, they are not likely to be found all together. But he starts one question, whether the not uncommon use of "catechize" for "punish" is really a confusion with "chastise," or whether it is not the word "catechize" itself, used in the same way as when Gideon "taught" the men of Succoth with thorns, or when *παιδεύειν* is used in the Gospel to express scourging. In short, we might turn over nearly every page of this little book, and find something to talk about as we go on. We can heartily recommend it as very carefully and sensibly put together, and as fully carrying out the promises of its title-page.

GROHMAN'S TYROL AND THE TYROLESE.*

SINCE Mr. Bonar wrote on chamois-hunting in the Bavarian Highlands, we have read nothing of the kind that has struck us so much as this book of Mr. Grohman's on Tyrol and the Tyrolese. He is at least as familiar as Mr. Bonar was with the picturesque country he describes, and to the full as enthusiastic over the wild sports to be enjoyed there. Mr. Grohman, indeed, expresses himself somewhat contemptuously as to the chamois-shooting in these Bavarian preserves. The game is actually too plentiful, the mountain scenery is comparatively tame, and so is the strategy chiefly in favour there, of driving the chamois in place of stalking them. Of course there are preserves in Austria as well, and we presume that some of the shooting grounds of the Emperor and Prince Fürstenberg may compare favourably with those of the Bavarian King. But Mr. Grohman for the most part took his shooting in the rough, seeking his game in those solitudes unprotected by keepers, which are the property of village communes, and free in the season to the peasants. Occasionally in some of the best of these tolerably heavy bags are to be made; but, as a rule, the chance of a shot at a chamois necessarily involves much time and patience. Nor need any one attempt an expedition among the peaks and precipices which are the animal's favourite haunts, unless he can rely absolutely on his nerves and head, and has a constitution besides that sets cold and hunger at defiance. As for Mr. Grohman, he dispensed generally with attendance or companionship, acting in all respects like the hardy natives. He would start for a two or three days' expedition, carrying in his ample *Rücksack* his coarse provisions and a cooking utensil. He sought his night quarters in some deserted hut on the snow-border, where he left his belongings while away for the day. He dressed precisely like the Tyrolese foresters—in a short frieze coat cut by a village tailor, and leather breeches that left the knees exposed. He had crampons of iron to fit to his feet on the ice-slopes, an alpenstock in his hand, and his rifle slung to his back. When he did come across any of the people of the country, he was "hail fellow, well met" with them at once, speaking their patois, as he tells us, sufficiently to pass for one of themselves, and being able to mask any peculiarities of manner that might have betrayed the foreigner and the gentleman.

It may be imagined then that his book must make lively reading, especially as he has a bright, easy style; and indeed most of his adventures are so extraordinary as almost to verge on the brink of the incredible. The excitement of the chamois chase, which is doubtless intense, betrayed him into situations that were something worse than embarrassing. Once towards the end of October, he started imprudently for a stalk late in the afternoon from the hut he had selected as his resting-place. He came on his game more quickly than might have been expected; and, after a final creep along a ledge five hundred yards long by two or two and a half feet wide, knocked over a venerable buck, who rose again and vanished. But the daylight was also disappearing so fast as to make it impossible to retrace his dangerous steps, far less to follow up the trail of the wounded animal. There was nothing for it but to pass the night where he was; an icy wind was blowing from the neighbouring snow-fields; he had stripped off his coat before beginning the ascent; and the most comfortable place he could find for his perch was in a shallow recess under a shelving cliff, with a precipice going down sheer in front of him. His sole consolation was the pipe, which he kept in pretty steady blast; but it says much for his strength and spirits that he was little the worse for twelve hours' exposure under circumstances so excessively trying. Far more critical was the situation he was landed in another time, when engaged on a similar adventure. Balancing himself on "a band of rock not more than twenty-eight or thirty inches broad, running horizontally across the face of a precipice four or five church steeples high,' he had gained a pinnacle above by means of a rope with a running noose. Once there, the rope slipped, and he saw nothing more of it. His only means of escape was by a drop back to the ledge he had started from, and the ledge was at a distance of twelve feet below him. The attempt appeared so desperate that he remained where he was for a couple of nights and the intervening day. On the second morning the pangs of hunger became excruciating, and he had to nerve himself to try the sole alternative that could save him from a lingering death. Happily, he literally lighted on his feet, and without a tremor to disturb his balance; although, having removed his boots as a precautionary measure, he was cut so as to be crippled for weeks.

* *Tyrol and the Tyrolese; the People and the Land in their Social, Sporting, and Mountaineering Aspects.* By W. A. Baillie Grohman. London: Longmans & Co. 1876.

Even more thrilling than this adventure was the part he played in robbing the eyrie of a pair of golden eagles. On a rough estimate, he believes that there are not more than some ten pairs of these noble birds left in all Tyrol and as they build in the most unfrequented recesses of the mountains, it is not often that they are traced to their breeding places. It was the more gratifying accordingly when a keeper and personal friend, whom he stumbled on at the Kufstein station, informed Mr. Grohman that a nest had been discovered. Forthwith he decided to make one of the party that proposed to visit it, and to devote, if necessary, days to the expedition. The expeditionary force consisted of himself, a couple of keepers, and half a dozen wood-cutters. The "Horst" or eyrie was in a cavity in the face of a mountain precipice, impossible of access from below, and protected above by a similar cornice nearly ninety feet below the brow of the cliff. On this cornice they had to lower themselves, leaving on the brow their companions behind to send them down their long fifty-fathom rope. On the cornice they improvised a wooden block to save the rope from fraying on the rock-edge; and it is much to the credit of Mr. Grohman's powers as a craftsman that he was singled out for the forlorn hope. Seated on a wooden bar, with a long iron-shod pole in his hand, he was launched out into space. After a slow descent of twelve or fifteen minutes he succeeded in gaining a footing in the nest, and gagged and bound the eagles he found therein. But then the old proverb of "Die Eier," &c., had a fresh illustration. The men hauled too quickly, and his pole escaped from his hands. He swung to and fro like a pendulum and must have been shattered at first on the rock had he not by good fortune landed off the shock with his iron-clamped boot-soles. Then the hauling ceased altogether, and for four mortal hours he swung in vacancy and uncertainty, during which he experienced the violence of a mountain thunderstorm. Considering that he momentarily expected the return of the parent birds, and that by their swoop on a man "his skull is cleft or fractured," or his body "ripped open from his chest to his hip," it may be imagined that these hours of suspense were agitating. It was only when he at last arrived at the top that he learned the various causes of the delay. The block they had made up had slipped from the ledge, and the man they had left above, having gone to cut a substitute, had been struck senseless by the lightning. Had he been killed, in place of being simply stunned, the rest of the party could scarcely have escaped starvation. Nor are we sure that even this most exciting episode is the climax of Mr. Grohman's mountaineering experiences, for we have a severe night skirmish with poachers as well, to say nothing of a winter ascent of the formidable Gross Glockner. And, if his memory has not played him false in estimating heights, and angles, and details in general, it is plain that one need not go many hours' march from the Tyrolese railway stations to have sport seasoned with any amount of danger, and with any quantity of hardships thrown into the bargain.

Mr. Grohmen is a great admirer of the Tyrolese, and he must know much more of them than most visitors to their mountains. But what he tells us scarcely confirms our previous prepossessions in their favour. They are brave and hardy no doubt, but truculent and quarrelsome. Like the blackcocks whose plumage they prize so greatly for hat feathers, they are always offering provocation to their rivals either in love or sport. To be the inhabitants of villages in valleys divided by a mountain is sufficient reason for a standing feud; nor is it unusual to make up parties for the express purpose of enlivening some neighbouring merrymaking with bloodshed. The social songs, or *Schnaddahüpfler*, that are most in favour are metrical taunts improvised for the irritation of some gentleman in the company; and the singer congratulates himself on a lyric success when he provokes their object to fly at his throat. The principal figures in the dances are rough horseplay, and the stalwart maidens swing up their partners by the arms, holding them suspended in the air, while the feet beat time on the ceiling. And when they do fight, even when they do not fall back on rifles and knives, they fight in a most barbarous, rough-and-tumble fashion. It is nothing unusual, as Mr. Grohman tells us, to gouge an eye, and he says that he has seen the sufferer thrust the eyeball back into the socket, and reseat himself at table with the boon companion who inflicted the injury. If their habits at this day remind us of the Northumbrian dalesmen before Bernard Gilpin began to civilize them, it is not surprising that they took to wild ways of getting a living early in the century, when they had been unsettled by the wars with the French and Bavarians. Then smuggling was so common that, as we are told, forty or fifty smugglers and revenue officers were annually killed in affairs on the frontiers. Now the free trade is nearly extinct, although every year there are still on an average four or five fatal casualties. But the passion for wild sports being innate in the Tyrolese heart, poaching is perhaps as prevalent as ever, and what can only be characterized as murders in cold blood are still of very frequent occurrence. Our readers may remember Mr. Bonar's accounts of the rancour existing between keepers and poachers, and Mr. Grohman more than confirms his statements. A single death leads to an interminable vendetta, and international animosities come in to embitter matters. The Tyrolese woodman, a skilled rifle shot, and a sportsman by instinct, has his hut close to an imaginary boundary line dividing his forests from well-stocked preserves. On Saturday evenings, when the week's work is done, the temptation is irresistible to make a raid over the frontier; and the keepers, who know their neighbours' ways, are about in force and on the outlook. [illegible] poachers elude observation at first, the report of the rifle gives the alarm, and then, should a keeper fall to a shot from an ambush, the law absolves the man who kills him. Mr. Grohman describes an affair at which he assisted as spectator, when a party of keepers carried a hut defended by four notorious poachers; and the fighting was as fierce, and the results as sanguinary, as if it had been a blockhouse in the Herzegovina stormed by Turkish soldiers. We cannot follow him into his career descriptions of Tyrolese life in villages and lonely *Senn*[illegible] vivid and interesting as they generally are. But we can recommend the book as singularly readable from the first chapter to the last, although the author might have shown more consideration for his readers' nerves had he toned down some of the most thrilling details in his series of hair-breadth escapes.

THE VALLANCEY SCHOOL OF PHILOLOGY.*

SINCE Vallancey gave to the world, in the year 1782, his *Essay on the Celtic Language, showing the Importance of the Hiberno-Celtic or Irish Dialect to Students in History, Antiquity, and the Greek and Roman Classics*, Ireland has experienced no lack of enthusiasts who delight in solving, as they in the plenitude of their innocence think, all the problems of ancient history and philology by means of Irish. This seems to offer a convenient seat to their national vanity, and, viewed in that light, it is perhaps to be encouraged rather than not. We had, however, been simple enough to expect that a growing familiarity with the science of language would have the effect of thinning their ranks. But we are doomed to be grievously disappointed; not only do they show no signs of falling off in point of numbers, but their activity is just now redoubling itself. For they have very cleverly changed their front and adopted the plan of making themselves acquainted with the works of some of the leading writers of the school of Bopp; they patronize it, and quietly borrow from it bright patches wherewith to embellish their own wild speculations.

This remark applies, without any alleviating circumstances, to the authors whose productions are now before us. The one who applies to call himself "Celtophile" owes his inspiration to a sense of the duty incumbent on him to come to the rescue of revelation. For, besides the danger to philology arising from hasty generalizations and dogmatic assertion, "there is," he tells us in the preface, "another danger, of more pernicious tendency, which seems strangely to beset students both of Geology and Philology—and that is, of connecting their pursuits on principles which seem to ignore the truths of Revelation." But it is far from evident that "Celtophile's" way of dealing with Scripture would be much more readily condoned by the Church than that which he ascribes to philologists who are too conscientious to attempt to force science and the Bible into mutual accommodation and an outward show of harmony. However, our readers will perhaps feel curious to know how a writer acquainted with the results of comparative philology can have the audacity to write on "Hebraeo-Celtic affinities." The way in which he manages to bring Hebrew and the Celtic languages together is rather interesting, as one of the few instances of sophistry in the book, the rest of it being the incoherent ravings of a hopeless Celtomaniac. In the opening paragraph of the first chapter we read as follows:—

> The Germanic and the Indian tongues have been united under a generic name; analogies have been pointed out between Sanskrit and the Celtic dialects; and the name *Aryan* has been selected to designate a very large linguistic family, with numerous and widely scattered offshoots.

After this subdued attempt to introduce us to a sort of a semi-detached Celtic sister, he proceeds thus:—

> The Semitic languages, however, have for a long period been considered as distinct from all the members of the Aryan family; in fact, to be dissimilar alike in roots and stems, and inflexional formatives; whilst any coincidences that may have been observed have usually been regarded as merely fortuitous and accidental. Of late years, however, some doubt has been cast upon this theory of Semitic isolation, and so many analogies of composition and formation have been pointed out as can scarcely be reconciled with the supposition of mere casual coincidence; nor does it appear too bold a presumption to look forward to a day not far distant when the great family relationship shall be clearly established.

To overpower the reader who may still feel a little sceptical as to the truth of this prophecy, "Celtophile" refers him in a footnote to Delitzsch's attempt to prove a relationship of roots between the Semitic and the Aryan families of language. But had he seen the work itself, and not merely its title, he would probably have abstained from mentioning it. For he would have found that Delitzsch's method is not his, nor does he arbitrarily pick out one Aryan language for comparison with a Semitic one chosen

---

* *Eremia; or, an Investigation of the Etymons of Words and Names, Classical and Scriptural, through the Medium of Celtic: together with some Remarks on Hebraeo-Celtic Affinities.* By a "Celtophile." London: Williams & Norgate. 1875.

The Aryan Origin of the Gaelic Race and Language. Showing the Present and Past Literary Position of Irish Gaelic; its Phonesis, the Fountain of Classic Pronunciation; its Laws Accord with Grimm's Laws; its Rarific Beauties the Source of Rhyme; the Civilization of Pagan Ireland; Early Knowledge of Letters; the Art of Illuminating, Ancient Architecture. The Round Towers. The Brehon Law. Truth of the Pentateuch. Knowledge in Pagan Times Retrogressive, not Progressive; the Inductive Sciences; Philology and Ethnology confirm the Truth of Irish History; Gaelic Names of Persons and Places Full of Historic Suggestiveness; in this Respect and in Poetic Power Irish Gaelic Superior to Sanskrit. One Thousand Unpublished Irish Manuscripts. By the Very Rev. U. J. Bourke, M.R.I.A., Canon of Tuam Cathedral, and President of St. Jarlath's College; Author of the "College Irish Grammar," "Easy Lessons in Irish," &c. London: Longmans & Co. 1875.

in the same arbitrary way, but would be content to have shown that the primeval language from which all the Aryan languages of historical times are descended was related to a similarly situated Semitic parent-speech. Even this, it is hardly necessary to state, the philological world, with the exception of Von Raumer, is at present inclined to regard as a hopeless task, and were our "Celtophile" right, Delitzsch and Von Raumer would find themselves without an inch of ground to stand upon. For the "many analogies of composition and formation" he talks about have enabled him to discover traces of the Celts—mostly Irish it would seem—from Kamtschatka to Peru, from the Ganges to the Tiber, and from Numidia to the Cape of Good Hope, to demonstrate in a single chapter the Celtic origin of half the vocabulary of Latin, and all the names of the heroes and gods of ancient Greece, and to devote the rest of his book to a similar treatment of Hebrew. To give our readers an adequate idea of his success in this direction would be more than we could undertake; suffice it to say that, among the Biblical names, Hebrew or other, which he explains with the greatest ease by means of Celtic, are the following:—Agag, Ajalon, Arad, Beersheba, Chedorlaomer, Gilgal, Horeb, Israel, Levi, Naphthali, Nebo, Og, Sehon, Sinai, and the like. Considering the author's skill and the formidable nature of the machinery at his command, the fact of his not as yet having deprived all other nations, the Chinese and Esquimaux not excepted, of every rag of a vocabulary, must be attributed to feelings of tenderness or lassitude on his part.

The title-page to "Celtophile's" book is certainly out of the common run of title-pages, but it is not to be compared with that of the President of St. Jarlath's College. This latter is a study in itself, but by no means the fruit of a solitary effort; for the headings to the sixteen chapters making up the book are all equally racy and redolent of the soil. Mr. Bourke is, we need not say, a true patriot, and his book is the height of some language intoirely. It does, however, testify to one trifling instance of the triumph of common sense; the author now no longer makes it a rule to call the modern patois of Irish peasants "Old Keltic," but is content mostly to speak of them as Irish Gaelic or Irish, although his work shows but little acquaintance with old Irish, or even with the printed specimens of the later and Augustan age of Irish literature. From the days of Moore to the present it has been the reproach of Irish scholars that they have, with a few brilliant exceptions, been too apathetic or too much afraid of work to make themselves acquainted with the annals of their country and the thoughts of their ancestors. So they readily contract a habit of flatulent expatiation on the glories and greatness of the ancient Irish and the endless excellences of their language, on the principle of *omne ignotum pro magnifico*. Mr. Bourke is one of those who revel in this kind of talk, or what seems to us to be such. We make this reserve advisedly; for, before we had done with him, we discovered to our confusion that he had all along been addressing himself to "the learned reader," and not to commonplace folks like ourselves. Now we happen to have a horror of the mysterious being known as "the learned reader," which recalls to our mind the almost superstitious awe with which we used in our college days to regard his prototype in Aristotle's Ethics. Besides, we have no idea as to how this "learned" referee looks at things, but we guess that certain touches in the work before us can only have been meant to call forth his approval. This, for instance, seems to be the case with the freshness imparted to the names mentioned in it, as when the greatest of living Celtists, Whitley Stokes, becomes "Whitley Stokes, M.D.," or Giraldus Cambrensis the very reverend historian Giraldus de Barry. It is quite refreshing also to those who happen to have a lively recollection of the portrait of old Dolly of Pentreath to find her transfigured into "Mrs. Dorothy Pentreath." But what "the learned reader" would say as to the author's treating the Ogham as a kind of shorthand, or calling Russian a "Finnish-Tartarian language," we do not know, though we cannot be mistaken as to what an outsider would say.

Here, as in the former case, we find that Mr. Bourke also is aware that there is a science of language; nay, he has read books on it, and his work teems with lengthy quotations from them. On the whole, his favourites are Professor Blackie, Professor Max Muller, and Professor Geddes, for each of whom he has many kind words and many a pat on the back. Professor Blackie he finds, naturally enough, a man after his own heart, and to Professor Max Müller he is indebted for his knowledge of the Sanskrit rules of *shandi*, as he is pleased to call them; so the following valuable, but characteristically diffident, account of them comes in most tastefully:—

> John Stuart Blackie is Professor of Greek in the University of Edinburgh, and the best linguist in Scotland. In his critical knowledge of languages he is not inferior to Frederick Max Müller, Taylorian Professor at Oxford, who at present is deemed by Englishmen to be the greatest linguist of the day. He has published a translation in verse of Goethe's *Faust* and an edition of Plato, &c.

The praise of such an authority is commendation indeed, and we make no doubt it is duly appreciated by the recipients. Professor Geddes, too, comes in for a spirt of this Hibernian *sódos*; but whether he will relish the kindness of his brother Gael of Tuam in holding up to admiration the following bit of random talk of his depends on the progress he may have latterly made in Celtic phonology:—

> How interesting it is to know that the leader under whom the Gauls poured down upon Rome in 390 B.C., bore among the Romans the name *Brennus*, and that this is still the Gaelic name for *judge*, and *judgment Breitheanas*, proving that the Gauls were under a social organisation at the time when the office of a king was not so much to lead in war as to dispense judgment and administer justice.

Were we not told otherwise, we should certainly have taken this to be the product of Mr. Bourke's own cogitations on the subject. But the fact cannot be concealed that the Vallancey school is nearly as flourishing in Scotland as it is in Ireland.

As Mr. Bourke's book discusses everything from the Round Towers to the "truth of the Pentateuch," we could not review it as a whole, seeing that it does not form a whole, but a queer farrago, in which harmless, probably unconscious rodomontade predominates; neither could we hope to pick the plums in it. For far from being

> rari nantes in gurgite vasto,

they meet us at every turn in great plenty. No scholar nowadays doubts the Aryan origin of the Gaelic language; but should more books like the one now before us be written on it, this could hardly be expected to hold true in time to come.

BOGUSLAWSKI'S DEVELOPMENT OF MODERN TACTICS.*

NO work written on the Franco-German War has attracted more attention than the modest volume of Major (then Captain) Boguslawski, published soon after its close, which we reviewed on its appearance; and this attention is fully deserved, for the book has not yet been rivalled as a scientific review of the new phase of tactics which improved firearms have introduced. The "Deductions," in fact, did for the events of 1870-71 much the same work, though in a very different manner, that the sparkling essay of the lamented May did for those of 1866, introducing the reader into the secrets of that marvellous success in training and discipline which had given the Prussians as complete a mastery over their foes as Napoleon's Grand Army had in its day over those whom it routed.

We may say here that it is idle for those who would seek the springs of the events that led the Second Empire to its rapid and ignominious defeat, to look only on the defects of organization and the numerical weakness laid bare by the *Commission d'Enquête*, the results of which a recent writer in *Blackwood's Magazine* has skilfully used. Omitting, for argument's sake, Woerth, Gravelotte, and Sedan, as cases in which the French were fatally outnumbered, there still remain the crucial instances of Spicheren, Borny, Mars-la-Tour, and Noisseville—actions in each of which they were as strong or stronger on the ground than the Germans—to prove that there were other and distinct causes for their constant failure besides the mere weight of their enemies. And, allowing something for bolder or more skilful leadership, there is yet a difference discernible that cannot be thus accounted for. That the result was not due to superior courage is clearly shown by the conduct of poor Abel Douay's overmatched division at Weissenburg in the first action of the war. It could be nothing but superior tactical handling of the artillery, or infantry, or both, that gave the strong heights held by Frossard to his assailants on the 6th of August, and enabled Manteuffel a week later to throw a larger force of French than his own back ignominiously on the works of Metz in the battle of the 14th of August. It certainly was nothing but a better and more spirited use of cavalry which paved the way to the constant German successes throughout their advance from the Saar to the Meuse. A writer, therefore, who did such a service as Boguslawski four years since in dissecting the exact causes of this professional superiority, adds to our scientific knowledge of the war, viewed even strictly in its historical light, and deserves some gratitude outside his profession.

He was happy in the choice of a task, and in the time for undertaking it whilst the ground was yet clear, and hardly less so in the manner of its execution; but, more than all, perhaps, in the absence of any dangerous rival. This cannot be said of the earlier and less known work of his of which a new edition is now before us, which reviews "the development of tactics from 1793 up to the present time," that time being the interval between the Prusso-Austrian War, and that yet greater war which, as his preface seems to imply, broke out almost before this volume had worked its way into popular favour. Any unknown Prussian writer then coming into the field of tactical literature had to contend against the disadvantage of finding it occupied by the controversy that arose around the *Tactical Retrospect*, bringing up discussions which were deemed so important to the future of the service that the greatest military authorities were not above taking part in them, under shelter of the names of their subordinates. Of this literature Boguslawski in the preface to his original edition speaks rather slightingly, little foreseeing how soon his own pen would give the world another work which critics would cite as containing as strong proofs as could be desired of the exact fulfilment of May's prophecies in the "Retrospect." But, if thus not wholly justified by what followed, Boguslawski is specially honest as against himself in his manner of reproducing his former work, now made sure of a welcome by the success of his later one. The new edition of the "Development of Tactics" is really, as the preface declares, a faithful transcript of the old one, the author availing himself only of notes when necessary for the purpose of introducing such comments on his own former reflections as naturally follow from recent experience. He has confined his actual alterations to correcting the strictly historical portions, those relating to 1866 especially, by the light of newer and more complete information.

* *Die Entwickelung der Taktik von 1793 bis zur Gegenwart.* Von A. v. Boguslawski, Major, &c. 2te Auflage. Mittler: Berlin.

He tells us especially that these portions are not to be viewed as a complete history of the events recorded, being introduced solely as the groundwork of the real purpose of the book—the working out of practical tactics. We may therefore well omit them from our notice, and confine ourselves to examining what the writer has to say of the alterations that preceded the latest development of the use of the breechloader. And here three several periods of change are necessarily brought home to a Prussian writer; the conflict between the effete system of Frederick in 1806 and the more mobile practice arising out of the revolutionary war; next that between France and Austria in 1859, when Prussia made up her mind to take the field, but came to the resolve so late that Solferino was won and a truce signed before her forces were mobilized; and, finally, the great campaign of 1866 in Bohemia, Major Boguslawski expressly excepting from his review of the war which cast Austria out of Germany the minor events on the Main. Each of these three is admirably treated, the author showing that clearness of style and mastery of detail which were noticed in his better known and later work.

Thus, taking the first section, we have nowhere seen so good an account as this volume presents of the great improvements introduced by Napoleon into the staff of the French army, of which the author truly says:—

> The staff became in fact the assistants, no longer the mere instruments, of the commander. The whole of the modern machinery of field forces, though modified in manifold ways in other armies and by the influence of time, was first constructed by Napoleon, and is still maintained in all its chief features what he made it. And it is characterized by the principle he adopted, the bringing into united action the forces evoked in the Revolution by allowing the utmost limits of freedom and independent action to the separate portions of the army.

Of course he here refers to Napoleon's special reform as regards the creation, or at least the thoroughly working out, of the institution of separate army corps, distinctly led but under one commander-in-chief, who was freed by this new agency from petty routine cares. And with similar precision and insight he explains what was the ordinary fighting order of the Napoleon infantry division, as dated from the Camp of Boulogne, and the special means which this afforded to its general to bring his command up rapidly, and yet force it forward into action in close order, covered usually only by its light companies as skirmishers. A study of this part of the volume will richly repay those who have in vain tried to get at the root of the tactical problems of the many great actions which range from Austerlitz to Waterloo. Napoleon's tactics, as the author shows, were as closely copied in other armies as those of Frederick had been before. But there is one exception of importance to ourselves, and no apology is needed for our giving at full length the extract which explains how our national peculiarities of system arose, and why they are maintained:—

> The English must be excepted. For these had in Spain, where they were aided by the insurrection of a whole nation, by iron discipline and a prudent waiting for the enemy's attack in order to reap the fullest advantages of the line-formation, maintained them happily against the tactics of columns and skirmishers. The more moderate scale on which the war was there carried on, and the lesser strength of the armies employed, contributed further to keep the English stationary; and thus their army in its adherence to line-tactics, in which it, with but slight modifications, fought even in the Crimean war, is to be regarded as the exception to the rule. No proof should be drawn from it of the applicability of these tactics either to the wars just spoken of or those of the present age.

This is a conclusion which no doubt many Englishmen will be ready to controvert, but which will nevertheless approve itself to every reader who has learnt to look on modern war as an art to be conducted on ascertained principles, and not left to chance teaching or treated as if made up of exceptions.

In half a page the author passes on from Waterloo to the campaign of Solferino. He bestows great pains on his study of the latter as marking one of the true tactical eras, introduced of course by the Minié and rifled cannon, though he does not forget to point out that the Prussian infantry had then already taken a long step in advance of others, the whole of the Line of his own country having already the needle-gun in their hands in 1858. Pélissier, when watching their mobilization from Nancy in the following year, whilst his master, conscious of political dangers before him if he pressed the Austrians too hard, hurried on the Treaty of Villafranca, little knew how fearful the odds would have been against him had the task really devolved on his corps of facing the 150,000 Germans who were ready just too late to cross the Rhine. As the author has here to notice the success of the French, he does not omit in his review to examine the weak points which the new and freer tactics just developed in Italy showed in their hands. These were prominent above all in the undisciplined "swarms of skirmishers, capable of only being very loosely handled, and the dissolution of all tactical order, evils which constantly made themselves felt, and foreshadowed the possibility of defeat after each advantage obtained." They had, in fact, acquired the freedom, but lacked entirely the intelligent training and clear subdivision of authority, which have made the Prussian skirmishing line so formidable a machine that it has almost absorbed as it were into itself the other main elements of infantry combat. For the "open-order firing-line" of the present day, however disguised, is but a denser and more orderly use of skirmishers pressed on to real attack, instead of being used only to cover it.

Passing over the third era treated of, the appearance of the breechloader in the fields of Bohemia, we must cast though it be but a brief glance at an interesting final chapter in which Major Boguslawski reviews the French tactics from the Prussian standpoint before the war. And we confess here to a feeling of surprise that so clear an exposition as the first edition of this work gave of the then existing differences between the two armies, which the writer, as he tells us, little thought were so soon to test their respective systems against each other, should have been in print, and yet should have been so little known. Just like the Prussians, the French before 1870 aimed in the theory of their instructions for the infantry at three vital points—(1) the discovery of new principles for the attack which might make it good in face of the breechloader; (2) the thorough instruction of the troops in the use of their new weapon; and (3) the invention of suitable formations for the novel description of fighting which must inevitably come into existence. Like the Prussians at the first until corrected by the events of 1866, they assumed a largely increased superiority for the defensive. Like them, they sought to gain the flank of the enemy as the hopeful point of assault. Like them, again, they saw that it was needful to extend largely the use of skirmishers. Into the particular measures taken for these ends we have not space to follow our author. Suffice it here to say that he points out with his usual justice and clearness the essential difference which underlay the two systems; the French regarding the second line as that to be used for the assault, the Germans the front line, which with them, therefore, was always ready to make it, and actually made it in many instances with speedy and decisive effect. It may be added that the French before the war evidently largely overcalculated the destructive power of the new arms, and so kept the bulk of their battalion at twice or even thrice the distance from its own skirmishing line in front that the Germans kept the company columns, which with them formed the real body of the first line throughout the earlier actions of the war. In short, the Germans were as much bolder as they were freer in their application of the new tactics, and reaped advantage from audacity as well as from lightness.

The French, however, to do them justice, may be fairly credited, on the testimony of Major Boguslawski, with carrying out into practice in the field what had been laid down for their infantry before the war in the regulations practised at Châlons. But it reads like a bitter satire nowadays to find that a Prussian writer had at that time ascertained, as he believed, that they contemplated using their cavalry after the fashion taught by Stuart in America, and carrying raiding expeditions far round the flanks of the enemy, and deep into the heart of his country. No doubt they thought and talked of some such ideal use of that arm, little dreaming how soon the test of war with its sharp exigencies was to be upon them, when their unpractised squadrons and mole-eyed staff would allow the Uhlan to wreak his will inside their own lines without the faintest attempt at check or requital. Verily there is a moral in such reading for every nation that sees the necessity of army reform clearly and yet refuses to accept it.

We part from this work regretfully. There are indeed blemishes in it. When Major Boguslawski crosses the Atlantic for an illustration, as when, in double error, he ascribes "the greater activity of cavalry in the American campaign" to the "inferior quality of American infantry," he blunders so widely, and so unlike himself, as to confirm the report that officers of his cloth purposely refrain from studying the great Civil War. But whether this republication be regarded purely for its theoretical teaching, or in its other light as a review of the tactical changes which preceded those wrought out by the breechloader, it is full of judicious instruction given in a pleasant style. And the military world is doubly fortunate in the success of the author's more recent "Deductions," which has caused the reappearance of his former volume, and ensures for it a large circle of readers.

TWO SHORT STORIES.*

We are glad to be able to congratulate "Holme Lee" on the production of a story which is fit to rank with the best bit of work that she has ever turned out. She has given us a charming picture, full of delicate touches and marks of close observation, and she has not weakened her theme by undue prolongation, spreading out the stuff of one volume into the space of three. *Ben Milner's Wooing* is a careful, compact, highly-finished novelette; sufficiently elaborated to give us distinct characters and varied circumstances, while keeping the plot together and the attention concentrated. Indeed the characters of this pleasant little book are as clear and lifelike as if they had been drawn double their size; and we have all the effect of a full-blown novel with none of the fatigue almost inseparable from the regulation nine hundred pages.

The most charming person in the gallery is, as it should be, the heroine, pretty Pattie Gardner; and the author has managed to portray her transition from childhood to womanhood, and from childish confidence to maidenly love, with great grace and skill. Though the heroine of a novel and the object of two love affairs at once, the one with the wrong man and the other with the right, she is thoroughly healthy and natural, is laudably free from hysterics, false sentiment, or exaggerated romance, has no nonsense about her from first to last, and as little moral distortion; but

* *Ben Milner's Wooing.* By Holme Lee, Author of "Sylvan Holt's Daughter," &c. London: Smith, Elder, & Co. 1876.

Merrer's Gardens. By the Author of "Four Messengers," "Echoes," &c. London: Bell & Sons. 1876.

goes through her trials with the grief and the rebound, the despair and the resolution, the little fits of ill temper and the habitual loving submission to her father and trust in her lover, just as a good girl of her stamp would have done in real life. Hence she is one of the most satisfactory of those odd young women who, as heroines of novels, do duty as representatives of ordinary English girlhood, that it has been our fortune to meet with for a long time; and we are grateful to the author for such a charming miniature. Ben Milner himself, too, is a fine fellow enough, but a difficult character to draw. The cool-blooded English lover who makes love as much by teasing as by more generally received methods of wooing, and who accepts check and disappointment with an equanimity that neither lessens his enjoyment in the theatre nor disturbs his rest or health, is very likely a fine and gallant man in real life, a sensible fellow, and none the less loving because manly and self-controlled; but he reads oddly in a novel, where we have long been accustomed to such exaggerations of sentiment as would make life impossible were they real. It takes a little time to reflect that the love which is only part of a man's life is a truer and even nobler kind of thing than that which so invades his manhood as to leave him a mere battered wreck when things go wrong—as they will do sometimes. We think, however, that the writer has made her hero at times unnecessarily, not exactly boorish, but unconventional, as when he receives Pattie as his guest without getting up from his chair, and asks her for a kiss, as if she were a little girl of seven instead of a maiden of seventeen. Seeing that he is consciously in love with her, and that he has had her invited to London by his sister to win her if he can, we might have expected a little more of the unconscious guile of love-making; but the picture is very pretty as it stands, and, if open to question, is realistic enough. We must give the sketch of Pattie as the author has drawn it, for we think it a favourable specimen of her own style and her heroine's personality:—

> Miss Phœbe chose to follow them downstairs, and nothing escaped her. She saw the gay assurance with which Ben looked down on his companion, and the frank simplicity with which she looked up again at him. Pattie's dress was primrose-colour—a light striped fabric of silk and gauze, that was soft, and shone, and fell in broad folds to the ground. At her throat and wrists were very close quilled ruffles of tulle, and on one side of her hair was a bow of primrose-ribbon and black velvet. She was rather above the middle height, and of a rounded, supple, slender form. No picture could be prettier than her face, but as Ben had told Phibs, it was indescribable. The cool lustre of modest girlhood and the grace of tender expression were there, and spirit and sense. All who knew Pattie were very fond of her, and called her lovely. Ben Milner this evening dubbed her divine.
>
> "I don't see that, nor do I suppose Pattie aspires to it yet," said Miss Phœbe, dryly.

This Miss Phœbe—"Phibs" to her brother Ben—is the oldest sister of the Milner family, and more of a mother than a sister to Ben. She has already prevented his marrying a certain Mary Halsted, "one of those womanly sweet women, whom good men rest in, and grow to love the more the longer they live together"; and she holds herself justified for her past cruelty, seeing that Ben was then only two-and-twenty and Mary was portionless. That this last married Mr. Lowther, a young surgeon, six months after her affair with Ben Milner was interrupted, somewhat justified Miss Phœbe's jealous taunt, as well as her prevision; but now when pretty Pattie Gardner comes on the scene the old maid's trials have to be renewed, and this time she must stand by quietly, and even help her brother to give himself over to another. The mixture of selfishness and love, old maiden primness and womanly tenderness, in "Phibs," deserves a passing note of approbation for the skill with which it is presented; and we feel sure that in the long run the nobler part of her will conquer the more ignoble, and that the woman's heart will carry it over the natural jealousy of the ancient sister disturbed in her long reign by the young bride, and that Ben Milner's marriage will be as prosperous as was his wooing. On the whole, we like this short novel better than any of the author's later writings. It is brighter, pleasanter, with more heartiness, and a truer ring altogether than much that she has done, and perhaps marks the beginning of a second and better manner.

If *Ben Milner's Wooing* attracts us by its lifelikeness and common sense, which must not be confounded with commonplace, *Mercer's Gardens* at the first arrests our attention in quite another way, by its ludicrous exaggerations and impossibilities. The first scene strikes the keynote. A young girl of uncertain age, young enough to be treated as a child, old enough to dream of love, to write romantic ballads, and translate Latin serious verse into half-comic English rhyme, is overheard spouting her translation of "Hanc tuæ (*sic*) Penelope lento tibi, mittet (*sic*) Ulysse," in Mercer's Gardens, by the young heir and owner of Mercer's Court, one Sir Redmond Hale. We do not pretend to have an exhaustive acquaintance with young baronets, heirs to large estates, but we should have imagined that very few among them would have behaved to even a shabbily dressed little girl as Sir Redmond behaved to Grace Arden. We have always fancied that gentle breeding carried with it good manners all through, as much for self-respect as for mere conventional propriety; but we suppose we must acknowledge ourselves mistaken, and accept the ways and words of young Sir Redmond to his strange little trespasser as a new reading in the laws of deportment—a reading, however, which blurs all the lines of demarcation between a gentleman and a cad. Also, we must accept Miss Agatha Arden, the aunt of the young poetess, as a possible portrait, and not wince when Grace goes up to her father and says, "I am so sorry to disappoint you, my own old man." This is an expression used, not for fun, nor yet for rudeness, seeing that she "stroked the white, silky hair, and kissed the worn sleeve, and whispered fondness." It is only her manner, just as Sir Redmond's impertinence, which would have justified a brother with a horsewhip, was only his. The result of the chance meeting in Mercer's Gardens is an invitation to Grace to go to Mercer's Court and see Christina, Sir Redmond's sister. This young lady comprises in the inventory of her various charms a "proudly-curved scarlet mouth," which must have been rather startling; and she has "sunny hair brushed behind delicate ears, free from the barbarous glitter of earrings." The butler of these young aristocrats is as odd as the rest of the people in this wholly unnatural gallery of caricatures. Here is his portrait:—

> Parsons was the aged guardian of Mercer's, the silver-haired, bent, and shrewd retainer, in whose care the place had been left during the long time that the orphan brother and sister were abroad. Old servitude, and stubborn self-esteem consequent on the importance attaching to the fact that he was sole representative of Sir Redmond Hale's greatness, had received every stimulant of loneliness and undisputed authority. Chronic crossness, and the despotism that had revelled for such a period in absolute, uncontradicted sway, combined in Parsons to form a not uncommon specimen of an indulged servant and an amusing obstinate old man.
>
> Despising modern innovations of livery, and disliking a plain suit, he had brushed and polished himself into a medley of Chelsea pensioner and London beadle and coachman on a drawing-room day, the last skilful touch being given by the splendidly gay nosegay at his waistcoat, designed after his own taste of dahlias, nasturtiums, a hollyock (*sic*), and poppies.

When Grace, whom Sir Redmond immediately calls "Gay," comes to see Miss Christina, this young lady of course feels an intense interest in her, and offers to help her in her education. Whereon Grace answers, "in the extremity of shyness, and feeling the acute contempt of her deficiencies mirrored in the spaniel's critical blinking eyes"—"I can only play by ear, and I cannot spell;" a statement that is almost as startling as the scarlet mouth, when we remember the poem with which the story opens, and the tongue on which it is founded. Further on, we come to a scene between a certain deaf old lady, Miss Courtenaye and Grace, wherein the girl, made hysterical by Sir Redmond's "satiric eyes" fixed on her face, laughs down the trumpet which the old lady holds up for her to speak into; and when asked her name, prompted by the baronet answers, "I am Miss Hale's confidante, Grace Arden." As this explanation is not quite satisfactory to Miss Courtenaye, she adds, always prompted by the baronet, "Sir Redmond says I am the Poet of Craye." Later, when Miss Courtenaye speaks of having a little neuralgia, this classic scholar and idiotic ignoramus asks, "What is *neu*ralgia, please? . . . A little neuralgia; what can it be? is it dangerous or only playful, like Miss Hale's spaniel?" At another time, Grace, going to see an old cottage woman, proposes to read her something, and forthwith plunges into Keats's *Pot of Basil*, ending her interview by promising the old woman a dinner of salmon, and a canary bird, the one being four shillings a pound, the other half a sovereign to buy, and she without sixpence. The whole story continues in the same absurdly forced and unnatural strain; and when we came to a confession of ignorance made by Grace at seventeen—

> "I did not know life was so hard," she murmured. "Sir Redmond and Miss Hale go away just as I begin to love them; and Mr. Harley, who was so kind and good, dies—yes, even dies," she went on excitedly, as if it was hardly credible that one whom she cared for could be called from her for ever. "And if this is life, all partings and dreadful separations, I do not want to live—

we confess to so much repugnance to a further waste of valuable time that we shut up *Mercer's Gardens* with the rest of the leaves uncut. The language is as strained and distorted as the characters. "Rather disconcerted by twiggy bedposts," is an expression used for birds sleeping on boughs; "quaint is the portrait of the slim figure in sandals" (query, sandalled shoes) "and curls crowded over the innocent forehead in a wiggy peculiarity of the age," expresses the image of Grace Arden's mother, Dulciana; and everywhere we fall on examples of feeble grammar and faulty composition from which the author's familiarity with Ovid and "Hanc tuæ Penelope" should have saved her. For one thing only can we commend the writer of *Mercer's Gardens*—the compression of all this nonsense into a single volume. Unfortunately, truth compels us to add that it is a thick volume, and rather closely printed.

MINOR NOTICES.

CONTRIBUTIONS to periodical literature are, as a rule, hardly worth reprinting, but an exception may fairly be made in favour of such papers as these which Mr. Skelton has just collected in a volume.* These essays are remarkable, not only for a certain eloquence and incisiveness of style, but especially for the temper and bias of mind which they display. The motto on the title-page is "In Defence!" and the writer in his dedication describes his work as "a volume of apologies." This gives us the key to Mr. Skelton's mission. He is the eager champion of ill-used reputations; and, whatever one may think of the pleas advanced, the chivalrous spirit of the writer must at least command sympathy and respect. It is a good quality in criticism to be anxious to discover the most favourable aspects of a subject, and it is one perhaps which is imperfectly cultivated at the present day. The longest and most important paper in this volume is that devoted

* *The Impeachment of Mary Stuart; and other Papers, Historical and Biographical.* By John Skelton. W. Blackwood & Sons.

to the story of Mary Queen of Scots. It originally appeared in a less developed form as an article in *Fraser's Magazine*, which was then edited by Mr. Froude, and, to avoid seeming to attack his friend's history, Mr. Skelton put his reply into the mouth of the counsel supposed to be retained in defence of the memory of the Queen, "who could attack his learned brother with the chartered freedom of the Bar." The device is ingenious, but it may be doubted whether the pleading would not have been more convincing if it had not appeared to come from one who was bound to a foregone conclusion. It should be said, however, that the writer himself is not a blind partisan of Queen Mary. In his eyes, she was neither a transcendent sinner nor a conspicuous saint, but "simply a brave, brilliant, high-spirited woman, who had a haughty scorn for meanness and cowardice, a hearty capacity for enjoyment, and who could hate her enemies with all the keenness of a quiet, sensitive, and somewhat pagan temper." In short, Mr. Skelton holds that Mary's "masculine, unsentimental career" has been misconstrued as an effeminate love-story. "If her lovers," he says, "went mad about her, she did not go mad about her lovers"; "no woman ever lived to whom love was less a necessity," and this was at once the strength of her character as a queen and her defect as a woman. It was her common sense, her wish to make the best of a bad business, which reconciled her to marriage with Bothwell. This is certainly an original view of Mary's character, and, though it seems to us unduly strained, there is perhaps some degree of truth in it. It is needless to say that Mr. Skelton does not believe in the Casket Letters. Another of the essays is a warm and generous vindication of Dryden from the aspersions of Macaulay. Dryden, it is admitted, was not a man of high principle or strong sense of duty, nor had he any very lofty conception of his literary vocation; but his pliability was due, not to meanness or baseness, but simply to his easy nature. The apology for Bolingbroke which follows deserves to be read, though it fails to convince. Indeed, the excuses which have to be made rather ratify the general condemnation. Other papers treat of Charles Napier and Dr. Robert Lee, the latter especially being an admirable sketch, not only of a strong and noble character, but of Church questions in Scotland.

Mr. Loftie has given us a very pleasant and interesting book about London*, and some notable places within easy reach of it. There is nothing perhaps which to an intelligent mind imparts so much relish to a ramble as the old memories and associations which are started in the course of it; yet it is wonderful how little, as a rule, Londoners know about their own streets in this way. The form of Mr. Loftie's book, which is one of a popular series issued by the Society for Promoting Christian Knowledge, necessarily limits its scope, and suggests a wish that the subject might be treated by so capable a writer in a more comprehensive, as well as more detailed, manner. Some day this may perhaps be done; and in the meantime we may be thankful for the present manual, which is excellent as far as it goes. Mr. Loftie first takes his readers for a peripatetic lesson in London geography, and it will possibly be a revelation to many of its inhabitants to learn that it stands on a series of low hills rising from the sloping bank of the river; that these hills are, or at least were, divided by brooks or bournes; and that, while north of Hyde Park the ground in some places rises to a hundred feet above the sea, at Millbank it is only twelve feet above the river. The highest ground in the City is not in Paryer Alley, but in Cannon Street, where it reaches sixty feet. Mr. Loftie of course does not profess to have made any new discoveries, but he presents a distinct and striking picture of the former aspects of London which will, we dare say, be new to some of its citizens. We cannot follow him through the details of "London four centuries ago," or again of "London a century back"; but we should think that any one who was wearied by the monotony of his walks in town would find them suddenly assuming a fresh interest, and raising constant curiosity and speculation in his mind after reading Mr. Loftie's descriptions of how the town looked in other days, before the old landmarks were swamped by bricks and mortar. Of the detached chapters of this work, one is given to St. Olave's Church in the City, which Pepys used to attend, and where he and his wife are buried—the register, by the way, spells the name Peyps. Another deals with Great St. Helen's, which, even in its present condition, well deserves a visit. In another sketch we are reminded of Fuller's connexion with the Savoy Chapel, where, as we learn from an advertisement, marriages were celebrated "with privacy, secrecy, and regularity. N.B. Five private ways by land, and two by water." Now that Northumberland House has disappeared, the account of it which is here given has a special historical value. Holland House has often been described, but Mr. Loftie connects it with the perhaps less known romantic story of Lady Sarah Lennox, who used at times to be making hay in the meadow facing the road when young George III. rode past. Mr. Loftie also serves as guide on one or two easy excursions from town—to Knole; Ingatestone, an old hall of the Petres in Essex, which, we fancy, is little known, standing in a pleasant green country; Berkhampstead, where two fragments of the masonry of the old castle of the Earls and Dukes of Cornwall may still be seen; St. Albans; and the Surrey Hills, in a secluded nook of which is old Chaldon Church, partly Early English, but mostly Perpendicular, with examples also of Norman, Decorated, Elizabethan, and so on, and a curious mural painting in tempera of the "Ladder of the Salvation of the Human Soul and the Road to Heaven," dating, it is supposed, from about the end of the twelfth century. Altogether, there are few books which contain so much interesting matter packed into such a modest space as "The Half-Holidays of a Town Clerk"; and many town clerks of another kind may be glad to have it as an agreeable companion for an afternoon ramble.

Mr. Swinburne lately proclaimed, in an article in the *Fortnightly Review*, his discovery of what he took to be a previously unknown genius "in that second golden age of English poetry which was comprised within the first quarter of the nineteenth century." This genius was Mr. Charles Wells, author of *Joseph and his Brethren* *, of which some extracts have been published; and the complete work is now offered to a generation which is supposed to be more appreciative than the author's contemporaries. Those who read Mr. Swinburne's "Prefatory Note" will certainly form a very high expectation of what is to come. This forgotten poet, we are assured, is "only lesser than the greatest of his time in some of the greatest qualities of his art"; and Mr. Swinburne is aghast at the "scandal of the fact that to this day this great dramatic poem remains known perhaps on the whole to about half-a-dozen students of English art." There are passages in it, we are assured, which might belong to Shakspeare, and we are repeatedly called upon to listen to "a grand Elizabethan echo." There is perhaps nothing more seductive than the enthusiasm of a discoverer; and it is easy to understand how the generous heat of Mr. Swinburne's poetic imagination has shed a lustre on his *protégé* which does not naturally belong to him. If we might on so grave a subject be allowed to use a familiar metaphor, we should be tempted to say that Mr. Swinburne's illumination of Mr. Wells rather suggests the glare of the policeman's bull's-eye, which invests the urchin in the doorway with a sudden glory. There can be no doubt that *Joseph and his Brethren* contains some very good versification. We agree with Mr. Swinburne that it has, at least in some passages, "ease and stateliness of manner," and "a sweet tenuity in the continuous melody of the verse," though we do not adopt the tautology of the latter expression. But these qualities are certainly not maintained throughout; nor do they compensate for the wearisome diffuseness of the language, the prosy clumsiness of many of the metaphors, and the general level of commonplace which marks the standard of the writer's ideas. No one who looks at the poem impartially can be surprised that at the period when it first appeared—that second golden age of English poetry, as Mr. Swinburne calls it—such a comparatively heavy and mechanical production should have little chance among so many brilliant and really inspired competitors. What Mr. Wells's poem wants is soaring power. He has facile movement, but his pinions do not carry him to the clouds. As a rustic idyl, the picture of Jacob and his sons is marked by sympathetic feeling, and there are also passages of narrative which are strong in their simplicity and straightforwardness; but there are, as far as we can see, no traces of that lifting up of spirit and wide outlook which is the sign of a great poet. The Scriptural story of Joseph is in itself very beautiful, and we do not find that Mr. Wells adds any touches to its beauty or meaning by his amplification. His attempt to develop the scenes between Joseph and Phraxanor is a conspicuous failure. Phraxanor is a coarse scold, and Joseph a prig of the first water, who prides himself on his power of moral argument. In the original, the more natural Joseph slips off in silent terror, and it may be thought that this is both much more true and touching than entering upon a wordy controversy. It seems, indeed, as if Mr. Wells's Joseph was quite ready to spend the day in discussing the question, for he waits till Potiphar arrives. A flesh-and-blood Joseph would perhaps be less confident either as to the force of his logic or his own power of resistance. Mr. Swinburne has in a high degree the sympathy which is necessary in a critic, but his imagination, when excited, is sometimes apt to obscure his judgment. In this case he is disposed to put Phraxanor alongside of Shakspeare's Cleopatra, but it is impossible to imagine a stronger contrast between clay and spirit than between the lecherous virago of Mr. Wells and Shakspeare's "serpent of old Nile." Let any one turn to Shakspeare and read a page, and then to Mr. Wells, and the difference will be felt at once. Even Mr. Swinburne himself seems to be not altogether blind to the weaknesses of the work which he lauds so highly. He acknowledges that the writer shows "an evident disposition to rest too easily contented with the first forms that offer themselves to clothe the first fancies," "an ignorance when to stop and when to breathe," and "a facile indulgence in superfluity of speech." He admits also that there is an "almost ludicrous or repellent side" to the interview between Joseph and Phraxanor, though he thinks it is overshadowed by the rest of the scene, and that there is a "continuous effusion of verbal luxury." Taken altogether, this poem may perhaps have been worth reprinting for the sake of some of its merits; but we can hardly say that the previous generation lost much by not knowing it, and it seems to us idle to speculate whether, if the author had received any encouragement, he might not have produced something better. As for Mr. Swinburne's wildly extravagant praise, it may be taken as an example of that creative criticism in which a critic sees what exists only in his own fervid imagination, just as even a dull person can, if he has a mind to it, discern wonderful things in the fire.

A new edition, revised and enlarged, of Mr. Matthew Arnold's

* *In and Out of London; or, the Half-Holidays of a Town Clerk.* By W. J. Loftie. Society for Promoting Christian Knowledge.

* *Joseph and his Brethren: a Dramatic Poem.* By Charles Wells. With an Introduction by Algernon Charles Swinburne. Chatto & Windus.

*Essays in Criticism** has just been published. Whatever may be thought of Mr. Arnold's views as to the regenerative power of criticism, every one must allow the subtle delicacy and discrimination which characterize his studies of Joubert, Heine, the De Guerins, Spinoza, Marcus Aurelius, &c.; and the volume which contains them will always be cherished by all true lovers of literary art. The "Persian Passion Play" is the new part of the volume.

Here is at last a really poetical valentine—the *Quiver of Love*†—which even a poet need not be ashamed to offer to his sweetheart. Nothing can be more depressing than the ordinary doggrel of the valentines of commerce, though there has certainly been some improvement of late years both in the verses and the illustrations. A sheep's heart stuck through with a skewer is the appropriate emblem of the common missive of love; and we are glad to see that arrows of a more delicate kind are now directed against hearts which are not supposed to be cut off from all connexion with intellect. Among the poets who are laid under contribution for the *Quiver of Love* are some of the most eminent in English literature, and the moderns who compete with them have at least a graceful facility of style, if less depth of sentiment. Perhaps there are no pieces in the collection which strike the right key of a valentine, just between hopeless dejection and undue confidence, better than Herrick's; and we are afraid that Shelley's "desire of the moth for the star" is a little too abject and remote from passionate desire to be very impressive. There are some valentines, however, from Shakspeare, Beaumont and Fletcher, Coleridge, and others, which are in the highest strain, and yet much to the point, while Burns's are almost ardent enough to char the paper. There is a very pretty valentine from Chatterton to a "Miss C———, of Bristol." But Marlowe's "Come live with me" is the sweetest and most perfect valentine of all. The illustrations to this volume are of a very picturesque and graceful kind, and printed in brilliant colours. Messrs. Ward and Co. also issue in a detached form a great variety of valentines, showing much taste and fancy.

Mr. Tennyson's play has given a keen interest to the character of Queen Mary, as is shown by the republication of a couple of old plays‡, one, *The Famous History of Sir Thomas Wyat*, by Decker and Webster, and the other, *The Troubles of Queen Elizabeth*, by Heywood; and by the appearance of a new edition of Sir Aubrey de Vere's *Mary Tudor*. The two former plays are interesting chiefly on account of the popular impressions prevailing at the period when they were written which they convey or suggest, for their literary qualities are of a very moderate kind. In Heywood's *Queen Elizabeth* we note the little incident of the Princess overhearing a milkmaid singing, and wishing she herself were one, which Mr. Tennyson has adopted. Sir Aubrey de Vere's work is of a poetical and impassioned character, and presents a vivid picture of the period, though its effect is somewhat marred by the diffuseness of its style. Mr. Tennyson has undoubtedly a firmer grasp of the subject and more robust concentration; while Sir Aubrey's full tide of words sometimes runs away with him. *Mary Tudor* was written in the last year of his life, 1845-6, and was published in the next without the benefit of a final revision; and it seems never to have taken public attention. Whether it is likely to do so now is perhaps doubtful; but it must in justice be said that it contains much melodious verse and graceful imagination. Sir Aubrey takes, on the whole, rather a favourable view of Mary's nature; he does not attempt to smooth over the cruelties for which she was responsible, but throws the chief guilt on Gardiner:—

> A worthy Queen she had been, if as little
> Of cruelty had been done under her
> As by her. . . . In fine, she was
> In all things excellent while she pursued
> Her own free inclination without fear!

Pole comes out very nobly in this drama. The volume also contains some sonnets by Sir Aubrey which are graceful in style, but without much in them.

The annual summaries from 1851 to 1875, which have been reprinted from the *Times*§, are useful not merely in refreshing the memory as to particular events, but in presenting a continuous and comprehensive survey of the history of the last quarter of a century. There is perhaps no period with regard to which most people have such vague and hazy ideas as with regard to that which lies between the floating news of the day and the systematic records of historians; yet there is nothing more necessary than a correct appreciation of the connexion and order of contemporary events. This digest from the *Times* is therefore, in spite of the modesty of its appearance, an important and valuable contribution to modern history, and even the best-informed readers may profit by the study of it.

The growing popularity of Lamb's writings‖ may be measured by the number of editions of them which are published from time to time. Messrs. Routledge issue, in a cheap form, what they call a "Popular Centenary Edition," with a judicious memoir by Mr. Charles Kent. In the course of his notice Mr. Kent quotes a letter by Miss Kelly, dated September last, giving the true story of "Barbara S——," Lamb having founded his version on an incident which happened to Miss Kelly, whom, however, he was at great pains not to identify. The type of this edition is rather small and close, but we suppose that must be expected in such a case. At the same time Messrs. Moxon and Co. publish the first volume of a new edition of Lamb's letters, essays, poems, and plays, accompanied by Talfourd's Life, the two parts of which are now combined together, with notes by Mr. Percy Fitzgerald. There is perhaps nothing more tiresome to a reader than having continually to shift his eye from the body of the page to the notes at the bottom, and this annoyance is intensified in the present case by some of the notes extending over several pages, so that the reader who follows them has to turn back afterwards to find his place in the text. It would surely have been better for Mr. Fitzgerald to write a new biography. This reprint of Lamb is to be in six volumes, and will make of course a more handsome edition than when the whole works are packed in a single volume.

Mr. Gibbs, the author of *Arlon Grange*, now comes out in competition with the Laureate in a legendary poem called *The Battle of the Standard*.* The author, if he never rises to any great elevation of thought or language, at least writes in a clear, manly, straightforward way, and his narrative is picturesque and animated.

White and Riddle's Latin Dictionary†, although based on the German work of Freund, has become, by repeated revision and amplification, a work of an original and independent character; and a fifth edition, in a single volume of 2,103 pages, which has just been issued, gives the results of the latest study of the language in a clear and systematic form. The test of such a work is to be applied not by merely glancing over its pages, but by its practical use, and the experience both of teachers and students has fully justified the confidence reposed in it. A special feature of value in this work is that it takes in the Latinity of every age, giving not only the old classical, but the patristic, forms.

Mr. Prichard, in editing a new edition of Bishop Percy's *Reliques*‡, has endeavoured rather to secure the correctness of the text, which he has collated with the folio manuscript and the first four editions, than to display his critical ingenuity. Dr. Percy had to take many of the pieces from defective copies, or from the imperfect recitations of illiterate singers, and he was perhaps a little too free in some of his emendations and additions. Still it is better to have an accurate version of the original than a speculative reconstruction by another hand. Mr. Prichard's edition may be recommended for its convenient size and clear type.

Mr. Markby, Judge of the High Court of Judicature at Calcutta, has added three chapters on the Transfer of Ownership, Security, and Succession to his work on the *Elements of Law*, and these have been issued in a separate form§ for the convenience of those who possess the former edition. In treating of Security Mr. Markby has followed Professor Kuntze's treatise, holding that reliance should not be placed exclusively on the views of French lawyers.

Mr. Maclean, of the *Bombay Gazette*, has succeeded in putting a very complete and useful account of the capital and chief seaport of Western India into a handy little volume‖, which also contains an official and mercantile directory. Besides the usual geographical details, he gives some interesting sketches of the history of "the island," the motley character of the population, and native festivals and customs. The writer admits that at all times, including the cold season, the climate of Bombay is rather relaxing than invigorating; but, on the other hand, even in the hottest months, May and October, the heat is tempered by the sea breeze. It is in the cold season that the weather is at its best, and society practically deserts the city except during these four months. We gather, however, that even in the height of festivities Bombay is not particularly lively. There is a theatre, but it is seldom open; there are occasional concerts and dancing-parties; but, as a rule, "formal dinner-parties are the only kind of gaiety that Bombay goes steadily in for." The enjoyment of these banquets is perhaps scarcely enhanced by the extreme touchiness which prevails in regard to precedence, so that a guest is advised to ascertain beforehand what he is himself entitled to or what he owes to others, or he may find himself at war with half the company before the evening is over. Club life seems to furnish some compensation for the stiffness of formal society.

When Mr. Tegg says he has "collated" the wills in his book¶, we fancy he must mean collected; for they are, for the most part, only brief summaries of wills, taken out of books or newspapers. A work of this kind, however, even when slight and scrappy, is sure to contain some curious and amusing matter. We have, for instance, many examples of the foolish and shabby vanity of testators,

as when one Greene directs four green waistcoats to be given to four poor women every year, while Thomas Gray commemorates himself by an annual distribution of six waistcoats of grey cloth. Husbands seem to be fond of taking in their wills a weak revenge on their wives. One left his wife a shilling "for picking his pocket of sixty guineas"; another left 50*l.* to "Elizabeth, whom, through my foolish fondness, I made my wife, without regard to family, fame, or fortune; and who in return has not spared, most unjustly, to accuse me of every crime regarding human nature, save highway robbery." One man put a ban on his widow wearing caps, another on his son growing moustaches. The late Lord Lytton's will, it is stated, contained special directions as to the examination of his body in order to provide against the possibility of his being buried in a trance. The story of Lord St. Leonards's missing will is told with the appropriate quotation from his book, "It is quite shocking to reflect upon the litigation which has been occasioned by men making their own wills."

Captain Kennedy, well-known as a chessplayer, has published in an enlarged form a second edition of some light, gossipy papers* about his favourite game. He is very indignant at the "silly prejudice" that chess is a mere recreation, and claims for it the dignity of a science; though, from the number of virtues which are said to be indispensable to a chessplayer, we should almost think it was rather a course of sublime moral discipline. One chapter is devoted to an account of Mr. Buckle's chessplaying, who seems to have been a consummate master of the art. His combinations were marked by exactitude of calculation and brilliant device, and he especially excelled in pawn play. He gave large odds, such as rook and knight, with wonderful skill and success, and appeared to have a sort of intuitive knowledge of a strange opponent's idiosyncrasies. Among other curiosities, Captain Kennedy gives a game between the Emperor Napoleon and Bertrand at St. Helena, which seems to show that, towards the end of the game, Bertrand, with a courtier-like instinct, gave up a strong position to allow the Emperor an opening which enabled him to win.

Dod's Peerage†, which includes baronets and knights, and courtesy titles, is now in its thirty-sixth year, and gives the usual complete and compact information. The same may be said of the well-known *Parliamentary Companion*.

Mr. Hutchinson has taken up seriously Mr. Stanley's *ad captandum* proposal for converting the natives of Central Africa by the combined efforts of missionaries and pedlars ‡, and thinks it was foreshadowed in "the prophetic language of the Seventy-second Psalm."

Mr. John Furley §, who had a good deal of experience as one of the Red Cross Volunteers during the Franco-German war, lately went to the North of Spain to see if he could be of any use in the struggle between the Carlists and Republicans. He found the ground jealously occupied by a Spanish Society, and his proffered services do not seem to have been very highly appreciated. He got some glimpses of the campaign, however, and the notes which he has now put together help to give one an idea of the loose, fitful, free and easy way in which the civil war in Spain is being carried on.

Captain Oliver, R.A., has been in the habit of making topographical and historical notes about places where he has been quartered on duty at home and abroad, and from his stores gathered in this way he now gives us an account of two Cornish castles ‖—Pendennis and St. Mawes—which affords interesting glimpses of what may be called byway history.

Colonel Fishwick has compiled a useful bibliographical catalogue of works relating to the topography and local history of Lancashire ¶, with notes on the books and authors.

Mr. Jones** is very angry with the "half-informed persons" who propagate the doctrine of evolution, and especially the "weak-minded class" who "commit the absurdity of trying to reconcile the doctrine with belief in a Personal First Cause." He holds that the theory of evolution is "from beginning to end an unverified and unvariable hypothesis," and denies that it has any scientific foundation. The irate tone, however, in which Mr. Jones himself argues seems hardly scientific.

Mr. Houghton, who has already produced several pleasant little works on natural history, now gives us some sketches of British insects †† as an introduction to the study of entomology in a scientific form. It is written in a plain and interesting way, and illustrated with some excellent coloured plates.

The Dwellers in Our Gardens ‡‡, by Miss Wood, is also intended to awaken an interest in natural history in its familiar aspects. It gives a simple account of the birds, beasts, and insects to be found in English gardens.

A series of admirable photographic views of Chiswick House and Grounds* has been taken for the Prince of Wales, who is in the habit of giving garden-parties there, by Mr. William Bedford, and are now published by permission. There are ten views in all, and they make a handsome and interesting drawing-room book. As studies of foliage, the work has a special value.

The late Mr. David Leslie's *Among the Zulus*†, though called a second edition, is really, as far as the public is concerned, a first edition, for in a collected form it has already only had a private circulation. Mr. Leslie was a young Scotchman who went out to Natal while a boy, and, having become proficient in the Zulu language, was at the age of fourteen appointed interpreter to the courts of law in Natal. Subsequently he rose to be one of the principal merchants there, but, having suffered from a bad commercial crisis some ten years ago, he abandoned his former pursuits for trading and hunting in the interior, where he lived on intimate terms with the natives, and had the best opportunities of studying them thoroughly. On recovering from an attack of fever, he returned to Glasgow in 1873, and some months after died there from disease of the lungs. Various scattered articles from his pen in the *Times* and other journals, English and colonial, are now republished, and furnish a valuable and interesting handbook to the country of the Zulus and Amatongos.

The Autobiography of Anne Lady Halkett‡, which in a fragmentary form has just been published by the Camden Society, affords some interesting glimpses of the society of the period. Lady Halkett was the daughter of Thomas Murray, tutor and afterwards secretary to Prince Charles (Charles I.), and is known as the author of various devotional meditations. Her life was passed partly in England and partly in Scotland, and she gives a very *naïve* account of her family relations, and the competition of her different suitors, of whom Sir James Halkett was finally successful.

Mr. Jarvis, on a visit to Stratford-on-Avon, discovered, among other curiosities, a so-called "Phusee-Glyptic Museum," § kept by Henry Jones, an old shoemaker, in a shed at the "Bull Inn." Mr. Jones explains the meaning of the title which he has bestowed on his exhibition by saying that it is "three parts natur' and one part art," and it appears that its contents consist of figures of men and animals formed out of roots of trees, gnarled wood, or oddly shaped stones, carved or otherwise touched up to suit the purpose. Mr. Jones is a self-taught artist, and shows some quaint humour in his works, judging from the specimens here pictured. He is also a poet, but of the Close type. The "Phusee-Glyptic Museum" may possibly be worth a visit if only for the sake of seeing its eccentric owner; but Mr. Jarvis's book is, both in its style and its subject, decidedly absurd.

Glengarriff, at the upper end of Bantry Bay, was, it seems, discovered some thirty years ago by Thackeray, who celebrated its beauty in his *Irish Sketch Book*; and, if the pictures in the handbook‖ now before us are to be trusted, his enthusiasm was justified. We are not sure, however, that Thackeray, who was charmed with the "pretty inn" at Glengarriff, would approve the proposed "central hotel," where grim waiters in white ties will, we fear, supplant the Peggy of other days.

THE ROYAL TITLE.

IN accordance with the precedent established at the time of the Union Mr. DISRAELI has brought in a Bill to enable the QUEEN, not to take a specified title with regard to India, but to take such title as she may think fit. On the present occasion this method of procedure has a great advantage. It enables Parliament to discuss the merits or demerits of the different titles which suggest themselves, without seeming to refuse or question a particular title which it might be supposed the QUEEN was desirous to obtain. Those who object to the QUEEN calling herself an Empress can do so frankly and without the painful hesitation which would have been necessarily caused by the knowledge that to be an Empress was what the QUEEN especially wished. Every one is sure that the QUEEN only wishes to do what is right. It is not at all in her manner to desire to be a little grander by putting herself on an equality with the NAPOLEONS. There is not the slightest reason to suppose that the QUEEN will be at all hurt or offended at the meaning of the word Empress being freely discussed. In any case the discussion must do good, as, if the title she assumes is that of Empress, the discussion will help to fix the sense in which she will be called Empress. In one sense the Crown of England has long been an Imperial Crown —that is, the monarch would not allow the supremacy of any other potentate, civil or ecclesiastical. The King entirely denied that the Roman Empire or the Roman See had any jurisdiction over him or his country. The epithet Imperial was thus in some measure relative, and implied independence of others. In this century Emperor has become a word with a new signification. It now merely means a very grand sovereign. Some of these very grand sovereigns have had other sovereigns under them. NAPOLEON not only had other sovereigns under him, but himself nominated most of his dependent monarchs. The present German EMPEROR has the several sovereigns of the German States under him. But it cannot be said that this is an essential part of the meaning of the word. The Second NAPOLEON had no kings under him, neither have the Emperors of RUSSIA and AUSTRIA. Some, again, of these very grand sovereigns have been despots. NAPOLEON was not only a despot, but one of the most wantonly tyrannical despots that ever lived. The Imperial Government of Russia is at this moment despotic. But the Emperors of GERMANY and AUSTRIA are constitutional monarchs. The QUEEN is a very great sovereign, and in the eyes of Englishmen, and perhaps in the eyes of a not inconsiderable portion of mankind, she is the greatest of all sovereigns. According to modern usage she might properly be called an Empress, even if she were not supposed to have subject princes under her, and although she is the most constitutional of constitutional monarchs. But in England we should excessively dislike her to be called Empress. In the first place, we are accustomed to think that her grandeur is above being augmented by the mere assumption of a grand name. She is the descendant of a long line of kings, and to be King of England is to be as high as earthly grandeur can go. She would be going down instead of going up to call herself Empress here. In the next place, the name of Emperor has an unpleasant sound to us. It has a bad air about it. It has been vulgarized by the rococo splendour of the Second French Empire. It associates itself with the ignoble tyranny of the First Napoleon. About the title of Queen we feel that there is nothing of the sham-splendid sort. It expresses in a thousand ways the relation which we wish the monarch to bear to her people.

Whether there should be some addition to the Royal title can hardly be said to be in dispute. India is so very important a part of the QUEEN'S dominions that it seems as if it ought to be recognized in her titles. At least four-fifths of the QUEEN'S subjects live there, and if she is Queen of anywhere she must be Queen of the place where four-fifths of her subjects live. When the Crown took over the direct government of India it was discussed whether there should not be an addition made to the Royal title which should mark what had happened. But the transfer took place immediately after the Mutiny, and was immediately due to the Mutiny, and the Ministry of the day rightly judged that it was inexpedient to connect the Royal title too intimately with the memory of a bloody and painful passage in our history. Things are changed now. The rule of England in India is firmly established, and accepted with patient, if not cheerful, acquiescence. It has become securely, and, so far as men can speak of permanence, permanently, a part of the possessions of the Crown. The native princes have cordially acknowledged the PRINCE OF WALES as the son and immediate representative of their Sovereign. England has gradually learnt what the possession of India means. We have interests in it which must preserve, we have duties towards it which we must discharge. Mr. LOWE has the great merit of daring to say unpopular things, and he ventures to bring forward an argument which must have occurred to many minds, but which no one else perhaps would have had the boldness to use. He urged that we might one day lose India, and that, if this happened, the Sovereign, with a part of his title taken from India, would be in an absurd position, either having to submit to the humiliation of docking his title, or to retain an illusory title like the old misnomer of King of France. The answer to this argument is that the only way to keep India is to proclaim to the world, and still more to take it as agreed between ourselves, that we mean to keep it. The addition to the Royal title at the present moment is therefore justified both by the consideration that it expresses the existing relation of the Crown to the princes and peoples of India, and that it brings home to Englishmen the intimacy of the connection between England and India. Both these objects have also been served by the very successful visit of the PRINCE to India; and the occasion of his visit has therefore been chosen as also the occasion of an addition to the Royal title.

These considerations only show that there should be an addition to the Royal title, and not what this title should be. This is purely a matter of sentiment; and the only question is, what weight should be given to conflicting sentiments. Is the QUEEN to be termed Queen or Empress of India? and is the addition to the title to regard India only, or the Colonies as well as India? It is said that for India Empress is a better word than Queen, because Empress is a grander word, and also because there are subject princes in India, and Empress means, in an especial way, the Queen of Kings. This raises the question, what are we to think of these princes? Are they really like sovereigns? Sir GEORGE CAMPBELL says positively that they are nothing of the sort. They are, in his view, at the utmost on a level with the Duke of ARGYLL, chiefs of great clans. Mr. DISRAELI urges, on the other hand, that some of them are the descendants of ancestors who were

independent princes when Britain was a Roman province. To call the QUEEN Empress is therefore a tribute to the importance of the native princes. Other speakers added that, if Emperor implies conquest—which it is difficult to see why it should be thought to do, except that the memory of NAPOLEON is always running in British minds—the truth is that India is a conquered country, and that it is a good thing to express true things. It was also suggested that the natives like personal government, and understand nothing else, and that there is a greater ring of personal government about an Empress than about a Queen. This is an argument from precisely the opposite point of view. There will not be, and cannot be, anything in the least like personal government in India, whatever the title of the Sovereign may be; so that in this way the advantage of the title of Empress would be that it would suggest to the untutored native mind something that was not true. With regard to the Colonies, it was asked by Mr. LOWE and Mr. FORSTER whether, if an addition to the Royal title was to be made because India was important, the Colonies were not also important, and did not deserve to have their importance marked in the addition? Mr. DISRAELI replied that their importance was already marked in a far more significant manner; for, as was expressly decided at the time of the union with Ireland, they are to be regarded as parts of Great Britain and Ireland. An Australian is an Englishman who happens to be in New South Wales, and *not* in Sussex; and to imply that he was anything else would be to insult him. If this is so, it is obvious that, by an addition to the Royal title referring only to India, a distinction would be set up between the QUEEN'S subjects unfavourable to India. At the present moment the QUEEN'S subjects in India must be taken to be included among those persons over whom she rules as Queen of Great Britain and Ireland. To take the Indians out of this class would be, according to Mr. DISRAELI, to put them in a separate and lower class. It is quite true that we, in point of fact, do look on the natives of India as a lower class than colonists of English descent, and it is now proposed to record this prepossession. The preference for the title of Empress over that of Queen is quite in accordance with this view. We should think it going down, not going up, if our QUEEN called herself an Empress. But Empress is thought just good enough for India. It conveys with it a sort of contempt disguised under the show of a compliment. It is supposed to be likely to flatter the vanity of native princes, and it is thought to be calculated to inspire a delusive but pleasing belief in the personal power of the Sovereign, while at the same time it records the fact that India is a conquered country. Empress is in every way a lower title than Queen when applied to India, for it is a word despised by the governing race, and thought specially suited to the governed. When an occasion presents itself for marking the intimate connexion of all the QUEEN'S subjects with each other, it seems scarcely worth while to stamp upon a portion of them this mark of inferiority.

THE SUEZ CANAL DEBATE.

MR. DISRAELI, though he at first hesitated to adjourn the Suez Canal debate, has no reason to regret his subsequent deference to the wishes of the leaders of the Opposition. Lord HARTINGTON would perhaps not have cared for a postponement if he had not been urged on by the characteristic impetuosity of his former chief. Mr. GLADSTONE'S determination to decline immediate discussion was evidently not caused by any uncertainty as to the merits of the question. His argument may perhaps be more copious when he has had full time to study the published papers, but the indignation which will prompt his eloquence needs no additional fuel. His patriotic anger found its first vent in a complaint that Mr. DISRAELI had intimated his habitual willingness to consult the inclination of the House. The Minister might, said Mr. GLADSTONE, have waited for somebody else to pay him a compliment. When Mr. GLADSTONE was in office he might have waited long before he was congratulated on the habitual courtesy and good humour of his demeanour. Having censured Mr. DISRAELI, Mr. GLADSTONE next fell foul of the metropolitan press, which had, as he said, given an inflammatory support to the Suez Canal purchase. Several years have passed since Mr. GLADSTONE proclaimed the superiority of provincial to metropolitan journals. Writers living in the centre of politics and society were too critical, too prone to judge of every question on its merits, and generally too independent. The country papers, on the other hand, were devoted to their party, and above all to its leader. It was remarked at the time by journalists who admitted the justice of the charge against themselves, that Mr. GLADSTONE displayed ingratitude to some devoted partisans in the London press. He has now the excuse of finding himself unsupported in his opposition to the Government measure by the enthusiastic *Telegraph* and the affectionate *Spectator*. The *Economist*, which disapproves of the purchase, is generally thought to possess weight and authority; but one or two exceptions to the inflammatory conduct of the London press were insufficient to avert Mr. GLADSTONE'S wrath. It is not stated who were inflamed, or what was the nature and tendency of the inflammation.

The points on which Mr. GLADSTONE professedly requires information are perhaps those which he most fully understands, and on which he hopes to found the strongest arguments against the Government. He is certainly not ignorant that, by the constitution of the Canal Company, disputes among shareholders are subject to the jurisdiction of French Courts, and that no shareholder can exercise more than ten votes. It is equally notorious that the Company is, in its territorial capacity, Egyptian or Turkish, and that any litigation with strangers, other than French subjects, belongs to Egyptian tribunals. Less zealous critics might perhaps consider that, as the purchase will undoubtedly be sanctioned by Parliament, it may not be for the public interest to define prematurely the method by which the inevitable influence of England over the policy of the Company may be most conveniently asserted; but Mr. GLADSTONE'S indignant reprobation of the purchase is not to be hampered by vulgar reasons of national expediency. The present Government has, in his judgment, committed several errors in one transaction. The purchase involves the immediate outlay and the uncertain repayment of a considerable sum; it has been regarded by inflammatory writers as an act of bold and seasonable policy; and, above all, it is a departure from the principles and practice of Mr. GLADSTONE. Deviation from the doctrines of an infallible statesman has on one or more previous occasions been imputed to his successors as a crime. In 1853 Mr. GLADSTONE announced that the Income-tax would expire in 1860; but the Crimean War intervened, and before the appointed time the Government of the day found it necessary to increase the percentage instead of reducing it. Mr. GLADSTONE consequently attacked Sir G. LEWIS, then Chancellor of the Exchequer, with unprecedented violence, on the absurd charge of a breach of faith. When the Russian Government in 1870 repudiated a main article of the Treaty of Paris, Mr. GLADSTONE, as Prime Minister, vindicated the breach of engagement on the ground that he had himself during his bitter opposition to Lord PALMERSTON in 1856 objected to stipulations which he thought unfavourable to Russia. In the present instance also Mr. DISRAELI and Lord DERBY are liable to the charge of heretical perversity. If it is true that an overture made to Mr. GLADSTONE'S Government for the purchase of the KHEDIVE'S shares was summarily rejected, the measure adopted by the present Ministers may seem to imply the incredible proposition that Mr. GLADSTONE was once in the wrong. As ST. LOUIS said of certain sceptics who had questioned the divinity of the chief of Catholic Saints, the only way of dealing with such miscreants is to draw the sword and run them through. Even if the late Government had no opportunity of considering the purchase, the measure is not the less a denial of Mr. GLADSTONE'S political creed. To spend money or to incur risk for national objects is a damnable error.

For party purposes Lord HARTINGTON has made a mistake in giving members time to make themselves acquainted with the recent history of the Suez Canal. The correspondence which has been published, while it illustrates Lord DERBY'S vigilance and firmness, shows the extreme difficulty of dealing with M. DE LESSEPS as the representative of a Company of French shareholders. It was time to effect some change in the relations between maritime States and a Company which, through its President, defied all external authority. It may be true that the acquisition of the KHEDIVE'S shares will not immediately correct all abuses; but a State which furnishes half the share capital of the Canal, in addition to seven-tenths of the tonnage which pays the revenue, will find that its just

reclamations cannot be treated with indifference. Other European Powers, only excepting France and Russia, have tacitly allowed the English Government to represent their interests; and they naturally approve of a transaction which will probably preclude the necessity of future remonstrances. The contempt with which M. DE LESSEPS has treated the recommendations of the International Commission and the decree of the Porte may be in a great degree attributed to the slackness of the Turkish Ministers, which may perhaps have been prompted by Russia. There is some advantage in a visible proof that the English Government is thoroughly in earnest.

The correspondence on the Suez Canal takes up the story nearly at the point at which it was left by the French despatches which had been previously published. The Report of the International Commission which sat at Constantinople had received the formal sanction of the Porte; and M. DE LESSEPS, finding that he would not be supported by the French Government, had abandoned his intention of resisting the final decision by force. Nevertheless, he addressed to the Porte a monthly protest in which he reserved the pretended right of recovering at a future time the difference between the tariff which had been rejected by the Commission and the dues actually levied "in violation of the Act of Concession." It was only on Lord DERBY'S remonstrance that the Turkish Ministers at last declined to receive protests which were at the same time a menace and an affront to the Government. M. DE LESSEPS in a published letter spoke of "an "astonishing claim" of the English Admiralty, which he further described as an act of "international brigandage." In defiance of the decree of the Porte, the Company habitually measured the tonnage of ships, instead of adopting the official certificate of the Board of Trade, and, in obedience to the orders of the President, his agents uniformly declined the legitimate jurisdiction of the Egyptian Courts. At a later period M. CHARLES DE LESSEPS, representing his father, proposed to discontinue the contumacious proceedings which had perhaps been adopted for the special purpose, on condition that the English Government should assent to a continuance of the temporary percentage added to the tolls by the Commission as a security for additional capital to be expended on the improvement of the Canal. The Duke DECAZES, in a Note to Lord LYONS, supported M. DE LESSEPS'S proposal that the increase of capital and the submission of the Company to the authority of the Porte should be simultaneously arranged; but after full consideration Lord DERBY adhered to his determination that in the first instance the Porte should enforce obedience to the recommendations of the Constantinople Commission. M. DE LESSEPS, having probably ascertained the intentions of the English Government, withdrew his demand for a prolongation of the increased tariff, and at the same time formally renewed his protest against the validity of the authorized tariff. The Turkish Government at last, on the urgent demand of the English Ambassador, informed the Company that all protests and reservations were groundless, null, and void. There can be no doubt that the controversy with the Canal Company impressed on Lord DERBY the inexpediency of allowing the whole property to be transferred to French owners. It is true that, if the undertaking is managed on purely commercial principles, the interests of the shareholders and of shipowners and freighters may be substantially the same; but there is no security against the intervention of political motives; and it is even possible that in certain contingencies one or more Governments might guarantee the Company against loss arising from impediments to navigation. The instructions to Mr. CAVE and the correspondence relating to his mission have no bearing on the purchase; and Mr. GLADSTONE will scarcely induce the House of Commons to postpone the vote until Colonel STOKES has reported on the position of the Government in respect of its shares. The case of the Ministers is greatly strengthened by the publication of the correspondence of 1874 and 1875.

PRINCE BISMARCK AND THE PRESS.

PRINCE BISMARCK has taken an opportunity afforded by the discussion of a Bill for altering the law as to the press to offer to the German Parliament one of those extraordinary harangues in which from time to time he tells curious pieces of secret history, propounds theories of statesmanship in which he appears to have an intense belief, and scatters almost at hazard aphorisms or epigrams which have generally the merit of originality. On this occasion Prince BISMARCK gave the secret history of the famous scare of last spring. It was remarked at the time that the part played by him at that period was one very difficult to understand. If he really meant to get up a new war, he showed very little of his usual ability in the mode in which he set to work, and very little of his usual firmness in the diplomatic complications that ensued. If he had nothing to do with the scare, why did he allow papers generally regarded as semi-official to stimulate the panic? Prince BISMARCK'S explanation will be perfectly satisfactory to all who will accept his statements upon his sole authority. He had nothing whatever to do with the scare. He had not the slightest wish for a new war, and has none now. His maxim is that Germany, being safe within its borders, should be content with what it has, and should remain strictly and entirely on the defensive. Even if he had been foolish and wicked enough to desire a new war last year, he might have been sure that the German Parliament would not have voted the necessary funds. Nor is it he that can make war. It is the EMPEROR who must in the last resort accept the responsibility; and how can it be believed, Prince BISMARCK asked, that the EMPEROR should lightly and wantonly make war, being, as he is, an old man, who knows well all the miseries that war entails, and who has had successes in war enough to satiate the most adventurous ambition? We must own that, if the German Parliament accepted these arguments as having all the force which Prince BISMARCK attributed to them, it is not easy to foreigners to follow their example. If Prince BISMARCK had chosen to say that Germany was in danger and war was necessary, we cannot feel at all sure that the German Parliament would have refused funds, or the EMPEROR his consent. But the main thing is not what arguments Prince BISMARCK added to his explanation, but the nature of this explanation itself. What he says, in as distinct language as a man can use, is that he personally never dreamt of war with France last spring, and had nothing whatever to do with those schemes or threats or appeals to public timidity by which the scare of last year was brought into existence. It is not that Prince BISMARCK did not go so far as some other people, or that he wished to produce a result, though not the result produced. He declares in effect that he had absolutely no more to do with the threats of war last spring than Mr. BRIGHT had to do with the Crimean war. It was a movement from which he not only stood aloof, but of which he heartily disapproved.

If this was so, how then did it happen that the semi-official press sounded the note of alarm which threw Europe for some dreary anxious days off its balance? Prince BISMARCK tells us exactly how this happened, so far as he can do so without mentioning names. He says that writers in the semi-official papers got hints as to what to say from certain foreign diplomatists who wished alarming articles to be written. The language of Prince BISMARCK leaves it doubtful whether he means that these foreign diplomatists actually paid to get the articles written, or whether the writers, having a particularly valuable article to sell, in the shape of what seemed to be official news, got a proportionate remuneration for their writings. But what Prince BISMARCK stated was that certain writers, to whom their communication with foreign diplomatists was a source of pecuniary gain, received hints or instructions from these diplomatists to write alarming articles. But then, as Prince BISMARCK acknowledges, these diplomatists had something to go upon. They were not spinning evil suggestions out of their own malicious bosoms. They had been deceived by Germans in a very high position, although not properly authorized to speak for Germany or to direct the politics of Germany. This, it will be remembered, exactly accords with the language of Lord DERBY, who said that the scare was not a mere piece of nonsense, that there had been real danger, and that the danger proceeded from persons in a very high position entertaining the view that the interests of Germany demanded a new war. Neither Lord DERBY nor Prince BISMARCK has informed us who these persons were, but Prince BISMARCK has now informed us that he was not one of them. And the incident has had one important result. It has opened the eyes of Prince BISMARCK to the danger and absurdity of the system of semi-official papers. He frankly owns that he used to think it convenient to have channels at his command by which he could let his countrymen know what he wished them to understand or

believe, without coming forward directly as the author of what was said. Generally some subordinate official wrote the article, and he merely corrected it; but occasionally he has written whole articles himself, and he added, with pardonable confidence in the trenchancy of his style, that he did not think that when he wrote many people could mistake the author. But then the journals used for this purpose were not bound to insert no other inspired articles than those which owed their inspiration to him. There were, more especially, those cunning and perhaps too liberal foreign diplomatists always lying in wait for an opportunity of inserting the dangerous compositions which they patronized in the midst of his wholesome and instructive matter. This is a mischief which he is determined shall not recur. He therefore informed the German Parliament that he had once for all severed the connexion of the Foreign Office with all journals except the two official ones. He is not going to inspire any one any more, and therefore, as he put it in his usual decisive manner, anybody who henceforth says that an article in a non-official journal has been inspired by the Foreign Office will know that he is telling a lie.

As Prince BISMARCK has determined to abstain for the future from the luxury of giving news in an indirect way, he views with great jealousy those who do not shrink from doing what he has decided not to do. The clause in the Press Bill with reference to which he spoke was one by which the purveyors of false news were subjected to serious penalties. On two previous occasions the Parliament had refused to pass the clause, and Prince BISMARCK stated that he was perfectly aware that his third and final attempt must fail. In point of fact, the clause was rejected soon after he sat down without discussion or division. But Prince BISMARCK stated that, in his view, it was one of the advantages of a Constitutional Monarchy as contrasted with a Republic that a Minister could, under the former system of Government, bring forward measures without the slightest prospect of passing them. He regarded the clause under consideration not as a piece of possible law, but as a text on which he could deliver a discourse which he had it much at heart to deliver. Besides giving the secret history of the scare, and tracing the history of his connexion with the semi-official press, Prince BISMARCK had another object in view. He wished to warn his countrymen against the very great evil of the modern system of telegraphing news from all parts of the world. In Germany he thought that he could see that the mania for looking for little scraps of information from all corners of the globe diverted the minds of men from a due consideration of homely practical questions of very much greater real importance to them. Everywhere, too, as he justly said, this unending flux of telegraphic communication keeps alive constant gambling and stock-jobbing. The news is very seldom true; and Prince BISMARCK stated, as the result of his experience, that he had found that political news was generally transmitted from places where it was perfectly impossible that any real acquaintance with the true state of facts could be procured. We in England can echo much of what Prince BISMARCK said. Nothing can be more dreary and futile for readers than to have to wade daily through column after column of telegrams, the greater part of which are wholly unimportant, and as to a very large part of which it is impossible to tell whether there is a word of truth in what is said or not. Telegrams sent to journals of the first class by correspondents on whose trustworthiness and sagacity there is good reason to rely are no doubt as likely to be true as any pieces of information hurriedly acquired and promptly sent off can be. But telegrams of this sort are only a small portion of the whole. If, again, Berlin suffers from telegraphic stock-jobbing, so, much more, do we. It has been stated, we do not know how far accurately, that during the excitement consequent on the Suez shares purchase—an excitement maintained and prolonged by incessant telegrams purporting to come from persons with special knowledge of what was going on in Egypt—Egyptian stock was bought and sold in London to the amount of three hundred millions sterling. That the fomentation of gambling by telegrams which are either altogether untrue or misrepresentations of a part of the truth is a great evil no one can deny. But in England we may hope that the evil will in some degree work its own cure. When we have learnt a proper distrust of telegrams they will not do us much harm. Already we have got so far in advance of Germany that foreign telegrams do not divert us from attending to our small domestic matters. Some day, perhaps, we shall learn in reading our papers to skip the telegrams unless they come in a way that gives them an especial title to confidence; and some day, too, we shall perhaps recognize that stock-jobbing in the midst of endless "wiring" is a game in which good simple people cannot hope to win.

THE NEW COURT OF FINAL APPEAL.

THE LORD CHANCELLOR had no difficulty in vindicating his own consistency in the matter of a Court of Final Appeal during the vacillation of the House of Lords and of the legal profession. As a passenger in an up-train at a station fancies that he is in motion because the parallel down-train has started, Lord CAIRNS seemed, not indeed to himself, but to others, responsible for the indifference of the Peers to their privileges in 1873, as contrasted with their sudden tenacity in 1875. His own opinion only ranged from acquiescence in the easy surrender of the jurisdiction to a conviction that it was neither desirable nor practicable to overcome the final resistance of the House of Lords, of the Bench, and the Bar. The Court which is now to be constituted will come gradually into complete existence as vacancies occur among the paid Judges of the Judicial Committee of Privy Council. As the LORD CHANCELLOR truly said, there is no immediate hurry, for the Law Lords in the House are capable and comparatively numerous, and the Judicial Committee disposes of its business to general satisfaction. When the system is at a future time in full operation, the whole number of judges of all ranks will be the same which was originally fixed by the Judicature Act. It is inexpedient to multiply judges, except under pressure of necessity; not for the reason alleged by Mr. GLADSTONE, that it is of primary importance to save judicial salaries, but because the Bar can only supply a limited number of candidates of the highest qualifications. The arrangements which have been in operation since last November have resulted in an economical distribution of judicial force; and it is only during the Circuits that any inconvenient pressure is to be apprehended. The LORD CHANCELLOR took occasion, with some humour, to establish a precedent for the limitation of the number of judges in England by announcing the decision of the Government to abstain from filling up the vacancy in the Irish Common Pleas. Imperial tyranny may perhaps be deemed more tolerable by Irish patriots when it is simultaneously or prospectively exercised at home. The proportion of judges of appeal to judges of first instance may be open to question; and the constitution of the Court of Intermediate Appeal under the Act of last Session has not in all cases been found satisfactory.

In accepting the Ministerial project, the House of Lords will have secured its nominal jurisdiction by the partial sacrifice of the hereditary character to which it has, with a sound instinct, earnestly and obstinately clung. It is true that the successful resistance of the House to the admission of Lord WENSLEYDALE as a life peer was justified by constitutional reasons which will be displaced by Lord CAIRNS's Bill. Lord PALMERSTON and Lord CRANWORTH attempted, in defiance of a fundamental principle of the Constitution, to revive, without reference to Parliament, a prerogative of the Crown which had become obsolete by disuse for a period of four hundred years. The danger of a similar anachronism had been illustrated during the Reform Bill agitation by proposals that the KING should correct the anomalies of the representative system by issuing and withholding writs in accordance with precedents not more antiquated than the creation of life peers. The Opposition would have performed a public duty in defeating Lord CRANWORTH's experiment, even if the introduction of life peers into the House of Lords had been approved by universal consent as intrinsically expedient. The majority which followed Lord LYNDHURST perhaps distinguished less accurately between the substance and the form of the Ministerial proceeding. A Chamber which has always been, except as to one of the Estates, strictly hereditary, may not unreasonably regard with suspicion and dislike the introduction into the system of a novel and alien element. The creation of an elderly and childless peer of ample fortune, without the customary remainder to his male issue, plainly and ostentatiously raised the issue of the future constitution of the House of Lords. Lord WENSLEYDALE would have been charged with no special duties which might have accounted

for his inferior tenure; and, if he had been admitted to take his seat in the House, no objection could afterwards have been consistently urged against the creation of an indefinite number of nominees of the Government of the day, who would probably have been inferior in fortune and social position to their hereditary colleagues. The Lords of Appeal, who will be something less than Peers for life, are limited in number; they have special functions to discharge; and they receive pay for their services. It has often been suggested that the great dignitaries of the law should, in virtue of their offices, sit by right in the House of Lords. Under Lord CAIRNS'S Bill the privilege will be conferred on the Lords of Appeal. As with the bishops, succession will, in the case of the new judges, be substituted for inheritance. A bishop forfeits his seat in the House of Lords when he resigns his see, and for many years past the junior bishop has had to wait for a vacancy before he can enjoy the full privilege of his rank. The compromise which the LORD CHANCELLOR proposes is probably the most favourable to the House of Lords which it would have been possible to effect. The dilution of the hereditary element is minute, and it is definite in quantity.

The Court of Final Appeal has many advantages over Lord SELBORNE'S scheme. The maintenance of the old jurisdiction meets all the technical and sentimental objections which were, with more or less sincerity, urged on behalf of Scotland, Ireland, the Colonies, and India. No part of the empire will be compelled to resort to a tribunal less august than that to which it has been accustomed. In the Judicial Committee, and, according to the LORD CHANCELLOR, in the House of Lords, the injured subject will receive redress immediately from the Sovereign. Some surprise has been caused by Lord CAIRNS'S digression into the original theory of the jurisdiction of the House of Lords; and the Peers will scarcely appreciate the solicitude with which he is careful to record in the form of petition the subordination of the authority of the House to the prerogative of the Crown. Lord HALE supported the same proposition on the ground that an independent jurisdiction inherent in the House of Lords would have been too aristocratical. The same reason will render the formal affirmation of the superiority of the Crown distasteful to the House of Lords. A love of fictions, which are often the best historical records, well becomes a great lawyer; but between two competing fictions it was unnecessary to express a preference. In the present day it is not disputed that the public interest is to be exclusively considered in the administration of justice. Lord CAIRNS may be justified in regarding the QUEEN as the fittest type of national right and duty, but the controversy might have been more conveniently avoided. If antiquarian research were to condemn Lord CAIRNS'S constitutional theory, it might nevertheless be highly desirable to appoint two or four Lords of Appeal, and to make the sittings of the House continuous during the judicial year. The provisions of the Bill are evidently the result of mature consideration, though it is possible that some amendments may be suggested in the course of Parliamentary discussion. Experience must show whether, as in the case of the Judicial Committee, the introduction of paid members who will attend regularly will render the Law Lords indifferent to the duties which have hitherto been performed with commendable assiduity.

It is a part of the LORD CHANCELLOR'S plan eventually to absorb into the House of Lords the greater portion or the whole of the functions of the Judicial Committee. Under the Acts which are now in force, the appointments of the paid members of the Privy Council are not to be renewed as vacancies occur, except by authority of Parliament. The LORD CHANCELLOR proposes that four Lords of Appeal shall ultimately take the place of the paid members of the Judicial Committee. He judiciously postpones any scheme for the complete consolidation of the two Courts of Final Appeal, but there can be no doubt that he contemplates the final establishment of a single tribunal. The exact number of judges and the manner in which their proceedings are to be arranged may properly be reserved for future settlement. It will perhaps be found that appeals from India and the Colonies are not altogether analogous to appeals from English or Irish courts. On the other hand, it is not impossible that, following the example of Canada, some of the Colonies may be eager to sever another strand in the thin bond of dependency which still connects them with the mother country. A generation hence the legislators of the day will be able to form a more confident estimate of the judicial wants of the empire. In the meantime a tolerably symmetrical system will have been established, without too wide or too sudden a divergence from ancient theory and practice. A Court of Final Appeal, though it discharges the important function of finally determining the law, has less to do with the practical administration of justice than the Court of Intermediate Appeal, and much less than the Divisions of the High Court which exercise original jurisdiction. The problem which was complicated by the claims and historical rights of the House of Lords seems to have been, on the whole, ingeniously and prudently solved.

FRANCE.

A LIVELY contest is going on in Corsica between M. ROUHER as the authorized representative of the Imperialists, and Prince NAPOLEON JEROME, who appears principally to represent himself. Probably if NAPOLEON III. were still living, his cousin would have proved less irrepressible than he now shows himself. At all events, both combatants seem prepared to rest their claims on the estimate which the late EMPEROR had formed of Prince NAPOLEON JEROME. Upon this point it is hard to say which has had the advantage. M. ROUHER has published a letter written by the EMPEROR to Prince NAPOLEON JEROME, which contains a decidedly unpleasant sketch of his character and career. But then this letter was written as long ago as March 1863, and Prince NAPOLEON JEROME holds that it was cancelled by a letter written shortly before the EMPEROR'S death, in which he speaks with kindness and confidence of the man whom ten years earlier he had charged with offering a consistent opposition to his policy. On the other hand it may be contended that, for the purposes of the Imperial party at all events, the EMPEROR'S heir must be accepted as the authorized exponent of what would have been the EMPEROR'S views, and there can be no question at all as to the attitude in which Prince NAPOLEON stands towards Prince NAPOLEON JEROME. I am forced, says the young PRINCE, to treat my cousin as an enemy, not only because he is opposing my most trusted adherent, but also because he is offering himself as a candidate for the Chamber of Deputies. The first condition of the BONAPARTE family dwelling together in unity is that no member of it should voluntarily place himself in a position where, in presence of unforeseen events, he may be obliged to act decisively without previous communication with the head of his House. If Prince NAPOLEON JEROME sits in the French Legislature he may at any moment have to vote upon some important motion in ignorance of, and possibly in opposition to, the view taken at Chiselhurst. It is the duty of a well-behaved cousin not to take this responsibility upon himself. The Imperialist tactics have often to be left undetermined up to the last moment, and M. NAPOLEON JEROME might easily find himself opposing a decision taken at Chiselhurst, not so much because he differs from it as because he is ignorant that it has been arrived at. It may be objected that M. ROUHER labours under this same disqualification, since, if he is to be of any service in the Chamber of Deputies, he must be living in Paris or Versailles, and while there will have only the same means of communicating with Chiselhurst as Prince NAPOLEON JEROME himself. But the independence of Prince NAPOLEON JEROME'S mind, or whatever less complimentary name may be given to those features of his character which lead him to oppose M. ROUHER, cannot be trusted to make him properly submissive to suggestions from head-quarters, even when there has been time to bring them to his notice. Prince NAPOLEON has good reason, therefore, to think that the presence of his cousin in the French Legislature might give to the Bonapartists an appearance of being divided among themselves, which would be highly detrimental to their prospects.

Prince NAPOLEON JEROME'S account of the question at issue is naturally quite different. He says rather cleverly that the name of NAPOLEON should be used as a resource in difficulty, not as a means of increasing the dissensions of Frenchmen. He does not come forward, that is to say, as an adversary of the Republic; on the contrary, he accepts it frankly, and is prepared to pay it all the respect due to an established Government, on condition that it gives the country what it wants—peace, order, and liberty. M. ROUHER'S words are not very different from Prince NAPOLEON JEROME'S, but there is an immense difference between the meanings which they are re-

spectively intended to convey. M. ROUHER awaits without impatience the results of the trial which the Republican Constitution is undergoing, but he awaits them with a settled conviction that the trial can have but one issue. These results, he says, will be identical with those that history has already recorded; and, further, they will be such as will enlighten the consciences of the most incredulous. It is not at all the same thing to say, If the Republic fails the Empire will be restored, and to say When the Republic fails the Empire will be restored. The change of the conjunction alters the whole meaning of the sentence. It is possible that at bottom Prince NAPOLEON JEROME is as hostile to the Republic as M. ROUHER himself; but this can at most be only an inference from his supposed character or his known antecedents. He does not avow himself an enemy of the Republic; on the contrary, he professes himself its humble servant. M. ROUHER in effect tells the electors whom he is canvassing that, if Frenchmen choose to be such fools as to give the Republic another trial, there is nothing for it but to wait until the Republic has given them another revolution, and then to proclaim the Empire. Prince NAPOLEON JEROME does not presume to find fault with his countrymen for giving the Republic another trial. He contents himself with defining what is required to make the trial a success, and merely drops a hint in passing that, in the event of its unhappily proving a failure, the name of NAPOLEON is a resource. It is more probable, however, that, in speaking of the Republic in this way, Prince NAPOLEON JEROME is really saying what he means. There would not be much scope for his ambition in a restored Empire. If the restoration came while the young PRINCE is morally, though not technically, under tutors and governors, it is quite certain that their influence would be altogether hostile to Prince NAPOLEON JEROME. He has nothing to hope from the EMPRESS, and not much from M. ROUHER. The divergence between his policy and theirs is sufficiently decided to make it difficult for him to play an important part under a Government of which they were the guiding influence. Prince NAPOLEON JEROME'S career has been conspicuously and consistently anti-clerical; and though he has found a Corsican priest to give him absolution even for the celebrated Good Friday banquet, apparently on the score that he is not so much addicted to swearing as some of his opponents in the island, there is no ground to suppose that a Government which wished to have the Church on its side would care to show him any special favour. If the restoration is delayed until NAPOLEON IV. has framed a policy of his own, the relations between his Government and Prince NAPOLEON JEROME are still more a matter of chance; and an ambitious man of fifty-four will not, if he can help it, leave his fortunes dependent on the good will of a boy of twenty. Prince NAPOLEON JEROME has another road open to him, and it is one which he may very well prefer to the regular path in which he cannot count upon doing anything more than following in the train of his cousin. If the Republic endures, a succession of Presidents will have to be found for it; and it is probable that the moderate Republicans will wish to maintain the distinction between the permanent and the Parliamentary Executive, and to make the leading politician for the time being the Minister of the President rather than the President himself. In that case any Princes of the dethroned families who have heartily accepted the Republic will have a strong claim upon the country. Their rank, which is a positive disadvantage in an ordinary political career, becomes a positive merit in a Chief of the Executive, inasmuch as it lifts him above the level of Parliamentary contests. Recent speculations have familiarized us with the idea of the Duke of AUMALE as Marshal MACMAHON'S successor, and it is quite possible that Prince NAPOLEON JEROME looks forward to playing a part in the plans of the advanced Republicans similar to that which has been assigned to the Duke of AUMALE in the plans of the moderate Republicans.

M. GAMBETTA has received a singular tribute from the Paris Radicals. After all that has been said by M. LOUIS BLANC and M. NAQUET in condemnation of the policy of compromise, the Irreconcilables have not thought it safe to oppose the leader of the Left, and it is far from improbable that their own special candidates will really owe their election to M. GAMBETTA'S support. Even a year ago he would have been thought a very rash prophet who had ventured to predict that M. GAMBETTA would bring Paris over to his views. It seemed far more likely that the general election would be seized upon as an occasion for proving to him that, however far he might have wandered from the true fold, Paris at least was true to her convictions. Those who hold this view will read with a feeling midway between astonishment and amusement the address of the Belleville Republicans to M. GAMBETTA. It would be too much to say that it expresses the genuine opinions of those who have signed it, for the doctrines, and even the phrases, are imported wholesale from M. GAMBETTA'S own speeches, and, even if we credit Belleville with the most devoted spirit of discipleship, there has hardly been time for it to assimilate a line of reasoning so entirely foreign to its character and history. But it really matters little whether the address does or does not express the genuine opinion of the Paris Radicals. What is important, and what is undoubted, is that in the most Radical quarter of Paris these opinions are accepted as the only opinions that have a chance of winning. Belleville has not usually been considered a nursery of practical politicians; but M. GAMBETTA'S constituents have clearly shown that, whatever license they may give to their wishes, they are prepared to restrict their hopes within reasonable limits. The only consolation which the extreme Radicals have thought it prudent to allow themselves is to recommend abstention in the Ninth arrondissement, where M. THIERS is opposed by a Conservative. There are reasons why M. THIERS should not be popular in Paris; and the wonder perhaps is rather that he should be unopposed in the Radical interest than that he should be unable to count upon the Radical vote.

LORD CARNARVON ON WEST AFRICA.

ONE of Lord GRANVILLE'S friendly criticisms on Lord CARNARVON'S West African speech was well founded. It would have been better to bring in a Bill for the exchange than to make a statement which could have no immediate result. The arguments in favour of the measure were strong enough to secure the assent of Parliament to immediate legislation; and the members of the House of Lords who have a special knowledge of colonial affairs, notwithstanding Lord KIMBERLEY'S reserves, virtually agreed with Lord CARNARVON. Lord BLACHFORD, who, as Under-Secretary for the Colonies, had formerly official knowledge of the affairs of West Africa, expressed a strong opinion in favour of the proposed consolidation of English territory. Lord CARNARVON himself confessed that the case which he laid before the House of Lords was so strong as almost to suggest a suspicion that there must be another side to the question. It may be hoped that his disparaging account of the Gambia will not induce the French Government to retract its proposal. In the main object of the exchange both countries have a common interest. The French will have no civilized rival between the tenth degree of North latitude and the frontier of Morocco, and England will be supreme from the Pongah to beyond the mouths of the Niger. It may be true that the navigation of the river Gambia is better than that of other rivers on the coast; but the upper waters approach the present French territory, and they have been little used for purposes of commerce. Lord CARNARVON did not state whether the Gaboon, which lies beyond the English settlements on the Gold Coast, is to be included in the French cession; but, even if the Gaboon is retained by France, an uninterrupted coast-line of 700 miles will be secured at the cost of a sacrifice which scarcely involves a loss. It may be hoped that the relations between England and France will long remain friendly; but in native wars and feuds it is possible that local officers might take different sides; and the competition between traders of the two countries is always liable to produce irritation. It is a purely verbal question whether the operation of ceding one territory for another is properly called a cession. One of the speakers, with equal truth and irrelevance, distinguished Lord CARNARVON'S project from the similar transaction by which the Dutch retired three or four years ago from their settlements on the Gold Coast. The cession of territory was in that case made exclusively by the Netherlands, while the English Government only released the Dutch from certain covenants affecting their frontier in Sumatra. It may be remembered that before the last general election Mr. DISRAELI was seized with a fit of transient indignation and alarm because one side of the Straits of Malacca had passed into foreign possession. The predominance of the French in North-Western Africa is perhaps equally calculated to arouse patriotic jealousy.

The opponents of the transfer are not without plausible arguments which of course require due consideration. Lord CARNARVON denies that the Gambia has been an English possession since the time of JAMES I., though a settlement was then made in the neighbourhood for the convenience of the slave trade. Whether the colonial history of the Gambia dates from the seventeenth or the nineteenth century, its historical associations appeal but faintly to the imagination. If the colony is two hundred and fifty years old, it was during the greater part of the time used for purposes which have since become unpopular; and the settlement which was either founded or restored in 1821 has not had a brilliant or prosperous career. The material part of the allegations made by Lord CARNARVON'S opponents is more to the purpose than the history of the colony. There is now a certain amount of legitimate trade in ivory, hides, bees'-wax, and principally in ground-nuts. The promoters of the exchange assert that the chief market for ground-nuts is in France; and, on the other hand, it is replied that the business is conducted by English merchants. The imports are chiefly of English goods, which will be discouraged if the colony passes under French administration. The traders of the neighbouring port of Senegal lately proposed in a memorial to their Government the imposition of prohibitory duties on English manufactures, and of a differential duty on English shipping. As they candidly stated, it was impossible for them to maintain competition on equal terms. There is no doubt that French traders will desire similar advantages on the Gambia; and it is possible that their applications may be received with favour. The opponents of the measure remind the Government that, when Senegal and Goree were restored to France after the war, English settlers found it impossible to carry on their trade, and that some of them transferred their establishments to the Gambia. In France, as in other countries, there has been some progress in liberality during sixty years, but, on the whole, English merchants trading with the Gambia are undoubtedly to some extent justified in their apprehensions. It is also probable that the civil and religious privileges of native English subjects will not be scrupulously respected by French administrators. An official Frenchman, though his own religious enthusiasm may not be excessive, instinctively dislikes Protestants of the English type.

The objections to Lord CARNARVON'S policy would be more conclusive if he proposed to abandon Gambia to the French without receiving an equivalent. It is easy to show that any purchase or sale is disadvantageous by examining only one side of the bargain. It is not a conclusive argument against selling a horse that he is quiet to ride and drive, and sound in wind and limb; nor, on the other side, is the price proved to be extravagant because the purchase-money might be usefully spent in other ways. Lord CARNARVON has satisfied himself that the exclusive possession of the coast-line for many miles in the neighbourhood of the other English settlements is more valuable than the retention of the Gambia; nor is he prepared to admit, without deduction, the arguments of the colonists and their supporters. It is true that the colony involves no charge on the English revenue; but, while it is self-supporting, in the sense of not receiving external support, its resources are insufficient for its wants. There are no funds applicable to the removal of the town to a more healthy situation; and a correspondence extending over some years has not yet resulted in the drainage of a pestiferous marsh. The French, who are in some respects less scrupulously economical, will probably at first be less unwilling to incur outlay for the benefit of the colonies; and they have more soldiers to dispose of in the probable event of a native war. The Marabouts, a fierce and proselytizing tribe or sect of Mahometans, have lately extended their conquests to the neighbourhood of the Gambia; and although they have hitherto professed a desire to maintain peace with the English, they have already come into collision with the French on the Senegal. The indigenous tribes also are frequently at war among themselves; and it is only by a judicious mixture of prudence and firmness that it has been found possible to keep clear of their quarrels.

It is not certain whether any of the places from which the French will retire are properly colonial possessions. At some points trading posts have been at different times used and abandoned; but there can be no doubt that, in default of an agreement, the French might resume their occupation of any place where they had at any time settled. It unluckily happens that an American firm of traders has acquired possession of an island at the mouth of the Mellicourie, which is included in the proposed English Protectorate. It is not known whether the American Government, which has at present no colonial possessions, will assert a claim of sovereignty which it would probably be necessary to admit. On the coast in general it is desirable to encourage legitimate commerce, and it is more urgently necessary to acquire a control over the trade in arms. The Ashantees and other tribes in the interior have lately imported rifles, and even breechloaders, through French ports. When English influence is predominant it will be possible to prohibit or discourage a dangerous practice. It is true that arms may possibly be still obtained at more distant markets; but the difficulties caused by want of roads, and by hostile relations with neighbouring tribes, would be considerable. It is probable that Parliament, having no strong opinion on South African questions, will be guided by the advice of the Colonial Minister, who is supported by the best authorities. The prejudice against removing inward the bounds of the Empire is wholesome and just; but the surrender to the mercies of a civilized Government of a dozen English traders and a few hundreds of natives is not calculated to disturb the susceptibilities of the country.

THE MERCHANT SHIPPING BILL.

THE new Merchant Shipping Bill has at all events the merit of being a surprise. Indeed it may be not unfairly intituled an Act to make perpetual the temporary Act of 1875. This is certainly not at all a slavish copy of the usual practice of Governments. When a Bill has been withdrawn in one Session they may or may not reintroduce it in the following Session, but they are not accustomed to say that a temporary machinery which was created to fill the gap caused by the withdrawal has answered so well that they have determined to make it a permanent machinery. This, however, is what the Board of Trade has done as regards the Merchant Shipping Bill. In 1875 the course of legislation ran in this way:—A Bill was introduced making very stringent regulations for the maintenance of discipline on board ship; laying down certain provisions, the observance of which would, it was supposed, tend to ensure the safety of sea-going ships and to provide evidence of the condition in which they are sent to sea; and defining the liability of ship-owners in cases where loss of life or personal injury is caused by the unseaworthiness of the vessel. At the very end of the Session this Bill was withdrawn, and to quiet the popular indignation which this event caused the Government devised the plan of arming the Board of Trade with temporary powers of so exceptional and sweeping a character as to make it a matter of little moment whether any specific regulations tending to insure the safety of ships were laid down or not. We said at the time that Sir CHARLES ADDERLEY had really put himself into the position of offering that, if sufficient powers were given him, no ship should for a year's time be sent to sea which was not fit to go, and that he was, in fact, invested with a dictatorship on the condition that he guaranteed the lives of seamen against risk. After six months of reflection and inquiry he now comes forward with the proposal that his dictatorship shall be made permanent. Under the powers you gave me, he tells the House of Commons, I have taken care that no unseaworthy ship has gone to sea. Make these powers part of the ordinary machinery of my department, and I will take equal care for the future. Consequently, the new Bill omits the clauses relative to the discipline of the crew, reproduces the clauses which last year were considered sufficient of themselves to guard sailors against avoidable danger, and then on the top of these piles up the clauses which were originally enacted as a temporary substitute for them.

The Bill begins by making the sending of an unseaworthy ship to sea a misdemeanour on the part of the owner, unless he can prove that he used all reasonable means to ensure her being sent to sea in a seaworthy state, "or that her going to sea in such unseaworthy state was "under the circumstances reasonable and justifiable." Considering that unseaworthiness has been before defined as a state which is likely to cause danger to the lives of the crew, it would be well to introduce into the Bill some inti-

mation as to what Parliament intends by "reasonable and "justifiable." Supposing that a ship which her owner knows to be rotten goes to sea and is lost, what must he prove in order to take himself out of this clause? May he plead that the ship was seaworthy in fine weather, and that the circumstance that she started on her voyage in summer, with no appearance of storm in the sky and no indication of it in the barometer, made her going reasonable and justifiable? Or may he plead that he had no seaworthy ship that he could send, and that if he had waited to get one he would have lost a valuable contract, or have inflicted loss on others by failing to fulfil his contract? Certainly, the reasons which make it "reasonable and justi- "fiable" to risk the lives of a crew ought to be defined as precisely as possible; and if Sir CHARLES ADDERLEY cannot arrive at any conclusion upon this point in time to insert it in the Bill, it might be well to submit a special case to the Judges as soon as the Bill has become an Act. The next clause in the Bill makes it impossible for a shipowner to contract himself out of the obligation to use all reasonable means to insure the seaworthiness of a ship. Certain other clauses, to be found at the end of the Bill, define the mode in which grain cargoes shall be stowed, provide that the space occupied by deck cargoes shall, with certain exceptions, be subject to tonnage dues, and direct the marking on the ship's side of a disc indicating the maximum load-line to which the owner intends to load the ship during that voyage. Whether these provisions are good or bad in themselves, they are not of the essence of the Bill. They are mere survivals from a pre-existent phase of legislation, when the idea of making the shipowner primarily responsible for the condition and fate of his ship had not been abandoned. The really important clauses of the Bill are framed on a wholly different conception of a shipowner's position. They throw the responsibility of allowing a ship to go to sea, not on the owner, but on the Board of Trade. If that Board have reason to believe, on complaint or otherwise, that a ship is unsafe, they may order her detention. After they have detained a ship they may appoint some competent person to survey her. On receiving the report of this competent person they may order the ship to be released or detained as they shall see fit. The owner or master of a ship detained, either provisionally or finally, may, if he chooses, appeal to a court of survey, consisting of a judge and two assessors, to be appointed under rules made by the LORD CHANCELLOR. It will be idle when such clauses as these are in force to talk of the responsibility of shipowners. The responsibility of sending a ship to sea will rest, not with the man who sends it, but with the men who might have stopped it, and did not. It will naturally be presumed that a ship which escaped a supervision so keen and practised as that created by the Bill can have had no conspicuous faults either in relation to its repairs or its loading. The condition of his ship will be merely a secondary question with a shipowner; the point he will really have to consider is his chance of evading the officers of the Board of Trade.

There are two aspects under which this Bill may be regarded. We may suppose that the officials of the Board of Trade will be both active and ubiquitous; or that after a time the detention of suspected ships will die down into a mere idle form. In the former case the whole shipping trade of the country will be placed under surveillance. It may be that this is a necessary measure, that the difficulties attending upon any alternative proposal are insurmountable, and that nothing but a vast machinery of detective officers can prevent unseaworthy ships from being sent to sea. In that case Sir CHARLES ADDERLEY is perhaps right in determining that such a machinery shall be created. But it is astonishing that he should represent his proposals as less sweeping and involving less interference with trade than Mr. PLIMSOLL'S proposals. The Government Bill may be a much better Bill than any which Mr. PLIMSOLL has suggested, but if it is really meant to answer its end it will subject shipowners to a chastisement of scorpions in place of whips. No precaution that a shipowner can take will exempt him from the risk of a provisional order for the detention of his ships. The Board of Trade has power to issue such an order "on complaint or otherwise," and considering that this provision is the backbone of the whole system by which it is now proposed to protect the lives of seamen, the Board of Trade may be expected in every doubtful case to take this precautionary measure. If, on the other hand, the Board of Trade takes things easily, discourages complaints, alleges that it is afraid of having to pay costs and damages, and generally acts as though it wished to leave shipowners alone, what becomes of the protection which the Bill is designed to afford to sailors? They will have to fall back upon the alleged deterrent effect of the section by which the sending of a ship to sea "in such unseaworthy state "that the life of any person is likely to be thereby "endangered" is made a misdemeanour. But here there is a weak point to which attention has been called. Prosecutions under this section can only be instituted "by or "with the consent of the Board of Trade." No doubt when it is desired to state some supposed principle of law in a more than ordinarily pompous way, it is sometimes convenient to do so by authorizing prosecutions for the breach of it, and then guarding against the natural consequences of this provision by enacting that no proceedings shall be taken without the consent of the Government. The Ecclesiastical Titles Act, while it remained on the Statute-book, was a conspicuous example of this process. It was a foolish Act, passed by a weak Government, in deference to a foolish panic, but the sting was entirely taken out of it by the judicious interposition of the ATTORNEY-GENERAL'S consent as a necessary preliminary to prosecution. If the Board of Trade is not in earnest in the matter, the third clause of the Merchant Shipping Act, supposing it is to be passed in its present shape, will speedily be reduced to the level of the Ecclesiastical Titles Act. How far this state of things will be likely to satisfy any really general feeling in favour of sailors may be guessed, if we try to imagine how such a restriction would have been received if it had been proposed to introduce it into the Public Worship Act. Shipowners who send rotten ships to sea stand almost as much in need of correction as clergymen who stand with their faces to the east instead of to the south, and it is difficult to see why the consent of the Government should be made indispensable to a prosecution of the former, when no such consent is required for a prosecution of the latter.

THE INCREASE OF THE EPISCOPATE.

ALTHOUGH Mr. BERESFORD HOPE'S Bill for an increase of the Episcopate has not obtained the formal acceptance which is implied in a second reading, it has served an important purpose in bringing out in an unmistakable manner the hearty and unanimous disposition of the House of Commons to do justice to the Church, and in not only clearing the way for the Government to take up the subject, but eliciting a distinct pledge that it will not evade that responsibility. Mr. CROSS accurately summed up the debate of Wednesday when he said that it showed an evident desire in almost all quarters to deal with the question in a fair and dispassionate manner. The objections to the Bill were almost exclusively directed to points of detail which would more fitly have been considered in Committee, while its general aim was warmly approved. As the debate went on it became more obvious that only minor differences held apart the supporters of the Bill and its friendly critics, and in the end they met in pleasant accord in the same lobby. It is of course impossible on such a question to expect to conciliate such irreconcilables as Mr. DILLWYN and Mr. REED, who are committed to a blind and fanatical antagonism, and are naturally eager to promote everything that is calculated to hamper and weaken an institution which they wish to destroy. Mr. DILLWYN, following in the wake of Mr. DALE, as he appeared at the Liberation meeting on the preceding evening, somewhat indiscreetly revealed the tactics of his party. In objecting to the setting up of a high class of officials who, in the event of a disestablishment of the Church, would have claims for compensation for the loss of their salaries, he apparently disregarded to fact that the new incomes would be provided either by voluntary effort or a redistribution of existing endowments; but it is perhaps as well to be warned of the scope which reckless iconoclasts of this type are ready to give to their dreams of confiscation. The statistics which have just been issued showing that, leaving out of account some important dioceses, and minor subscriptions, not less that twenty-six millions of money have within the last thirty-five years been expended by private liberality in building or restoring churches, at a cost exceeding in each

case 500*l.*, may be supposed to be a conclusive proof of the prevailing tendency of opinion with regard to the Church; but there is reason to fear that the exhibition of this possible spoil may whet the cupidity of its assailants. In any case, it is obvious that, whatever view may be taken of the question of Disestablishment, it is only fair that, while the Establishment exists, it ought not to be crippled in its means of efficient administration. The fact that, while the population of England has increased fivefold since the reign of HENRY VIII., not a single Bishop has during the succeeding generations been added to the Episcopate, speaks for itself; for though the bishoprics of Ripon and Manchester have been created, those of Bristol and Westminster have disappeared. No one who has any acquaintance with the matter can fail to see that in all directions the work of the Bishops has grown, not only through increase of population, but by multiplication of duties, far beyond the powers of the present limited staff, strained and busy as they are, and that, if the Bishops are to do their work in an adequate manner, they must have assistance. It has been suggested that some relief might perhaps be obtained by the Bishops making a stand against various petty encroachments on their time and attention, which are said to have been gradually extending in consequence of their timidity and fear of giving offence. But, even making every allowance on this account, there is a large accumulation of useful and important duties which has gradually settled on the Bishops, and which cannot be adequately fulfilled unless the number of Bishops is brought into some reasonable correspondence with the increasing multitude of clergymen and congregations over which they are expected to exercise a constant and watchful supervision.

While there is a general agreement as to the necessity of placing the Episcopate on a proper footing, it is only natural to find some differences of opinion as to the best method of carrying out this object. One of the chief objections to Mr. BERESFORD HOPE'S Bill, which is in fact Lord LYTTELTON'S Bill as it came down from the House of Lords, has been that the subject was one which could only be dealt with satisfactorily by the Government of the day; but this, although it expressed a reasonable opinion, was obviously an idle argument against a measure which existed expressly as a protest against the inaction of the Government. Everybody knows that a Government has it in its power not only to secure a more favourable reception for a Bill, but to press it through its various stages much more steadily and vigorously than a private member; and the supporters of the Episcopate Bill would certainly have been very glad if the Ministry had arrived at an earlier appreciation of its duty, and proposed a scheme of its own. Another criticism on the Bill was that it was vague and indefinite in some of its provisions; but those who know anything of the working of such measures must be aware of the necessity for some degree of elasticity as to arrangements of the future; and the satisfactory experience of the Church Building Acts, which are equally open to the same objection, and which have had the effect of bringing out immense sums of money for the increase of church accommodation, shows that these apprehensions are groundless. There are no doubt some points which will require careful consideration in any plan which may be proposed, and the present Bill is of course open to improvement. Indeed this was fully admitted by the mover, who offered to insert a proviso in Committee that no bishopric should be created under the Bill with a less area than an entire county, or some portion of a county with not less than a fixed minimum population, it being stipulated at the same time that the residuary bishopric out of which the new one was formed should fulfil the same conditions. This would operate as a check on the indiscriminate creation of sees from motives of personal or local vanity or caprice, of which some alarm has been expressed, and would, as Mr. BERESFORD HOPE pointed out, render it impossible for any person, however lavish with his money, to indulge in the luxury of a sort of grand private chaplain by setting up a new diocese for a very small or thinly-peopled district. What, however, is above all important in framing any plan is that it shall not be a mere driblet of relief, like a drop in the ocean, but a broad and systematic attempt to meet the necessities of the case, and to provide not merely for casual or isolated cases, but for the general efficiency of [illegible]opal administration over the whole country. If [illegible] is left to be done by fits and starts, according to the fluctuating moods or convenience of the Government, the process of revision and adaptation is certain to be carried out in an imperfect and accidental sort of way; while, on the other hand, there will be a needless provocation of irritating discussions. What is wanted is to put things into a groove in which they will move in a regular and steady way. The Government approaches its task under the most favourable circumstances, and there is no reason why it should find it a very difficult one. The promised establishment of a bishopric in Cornwall as soon as the necessary funds are provided is a natural sequel to the course taken in regard to St. Albans; and the Government will be free to deal with other cases in a similar way. At the same time, this ought not to stand in the way of a broad and well-devised machinery for utilizing private munificence.

THE SPIRIT OF BARGAINING.

EVERY pursuit has some pleasure distinct from its special and immediate object, as is conspicuously the case, for example, with the making of collections. In most instances the pleasures incidental to collecting go equal shares with pleasure in the things collected; the collector rarely dissociating the two. Now money and well-bestowed skill and pains furnish the auxiliary gratifications in this case. The rich collector finds pleasure in having given large sums for some unique specimen; a fellow-enthusiast finds still greater pleasure in having got his a bargain; his is the keener joy of feeling that intellect and sharpness have stood him instead of an overflowing purse. Anybody can collect treasures who can pay for them; but there is sport in "higgling upon a halfpenny," lest by a too ready acquiescence in the dealer's first price he should be led to suspect the real value of the article. What must have been "Snuffy" Davies's feelings when his unrivalled skill and research secured for the easy equivalent of twopence sterling that precious tract *The Game of Chess*, which he lived to see bought by Royalty for a hundred and seventy guineas? But, much as we may sympathize with such feats, if we attempt to rival them in our own time we feel to be treading on tender ground. When barter is a recognized mode of purchase people are justified in thinking mainly of their own interest, and when the collector deals with the broker he may fairly set his knowledge against the other's ignorance, for every man ought to know his own business. But when the rage for old china, for example, leads the modern collector to search in obscure haunts for specimens, and when he detects in cottage or farmhouse some treasure on which the whim of the day sets an extravagant value of which the owner knows nothing, then conscience is exercised, and should have a word to say. Is it fair to offer five shillings when five pounds is the market value? A good deal may, no doubt, be said on the purchaser's side. The market value is an ephemeral value. When the fancy for old Bristol or old Chelsea is over—and it is but a fancy—the specimen will relapse into its present use, and will figure as before among broken tea-cups, wisely kept for show, from whence never again will virtuoso seek to withdraw it. The collector may argue (and we do not contradict him) that he has a right to make the most of knowledge which has cost him something to acquire in time, or money, or the neglect of more important things, or bitter experience in cases where he has been the dupe. And he may justify himself by precedents innumerable. Who ever scrupled at the arts by which an old woman was wheedled out of a bundle of priceless ballads dearer to her than her psalm-book for a pound of snuff and a copy of the *Complete Siren*? Still a certain uneasiness is apt to be felt where all the knowledge is on one side, and it is essential to the success of the bargain that the knowledge should remain one-sided. Certainly the triumph in such dealings is enhanced by the *soupçon* of circumventing with which it is flavoured. Else where would be the cleverness? Most people settle the matter with themselves, and reconcile their dignity or their conscience by a middle course. They give a sum which would be liberal, or even profuse, supposing the article in question to be worth no more than the owner supposes it. After all, he is not likely to do better if the thing were left on his hands.

We have touched on the ethics of collecting, as being with many people the natural field for the indulgence of that spirit of barter inherent in humanity, which, if it does not find a vent, will force one for itself. Money confers on its possessor two distinct gratifications, so distinct indeed as at first sight to appear incompatible with each other. There is pleasure in spending, and there is pleasure in saving, but these seem to imply two opposite mental conditions. Yet in one class of transactions the joys meet. The keen negotiator of bargains contrives to experience the two sensations simultaneously. There are people who would never willingly spend without saving at the same time, and who enjoy spending if it opens a way to the exercise of their talents in this direction; and this irrespectively of the value of the thing thus secured. We are not speaking of that weak craving for possession which is tempted by everything that comes with the recommendation of cheapness, not of the lover of bargains that are obtruded upon his notice, but of the promoter and driver of bargains. To the miser spending is an unmixed evil, a grudged and odious necessity. Others are born with as keen an appreciation of the delights of property who yet willingly spend their money so

long as they have reason to believe themselves the only gainers by the transaction. Money is with them not merely a medium of exchange, it is a mental stimulant. When the Duke of Marlborough took out of his secretaire a purse of broad pieces, and, after viewing them with visible satisfaction, bid his friend "Observe these pieces well! they deserve to be observed; there are just forty of them; 'tis the very first *sum* I ever got in my life, and I have kept it always unbroken from that time to this day," he was illustrating the miser's temper. Quite different from this is the instinct of barter which leads the boy who for the first time finds himself the owner of a shilling to recognize money as a whetstone to his sharpness, the weapon wherewith he is to get the better of his fellows and win the battle of life. He does not lay by his shilling, but plans with it how it may fructify, get more than its worth, and become the mother of many shillings.

Now, of course, barter is of the essence of trade. Buying and selling are acts necessary to success in trade, but they may be carried on in their proper sphere without telling upon either temper or conduct beyond that sphere. Observation and experience show that nobody is so open-handed as the successful merchant. It is not trade that makes the higgler, but something much deeper and forming part of the man's nature. Nor does the necessity for bargaining make him. In some countries every purchase is a hand-to-hand encounter of wits. It is an understood thing that the seller asks more than he expects to get, and that it would be a mere extravagance to yield to a first demand. There are obscure trades where barter is still the rule with us. In fairs and markets there is legitimate room for it; we may see in our streets invitations to the unwary couched in the announcement that no reasonable offer will be refused; the pedlar chaffers with his customers on equal terms. It is only where the temper shows itself out of bounds that it may be noted as a feature of character. The tendency of civilization is to keep the active spirit of barter out of sight. In our ordinary retail dealings fixed prices are the rule. If grocers are exorbitant, we do not beat them down, but join a Civil Service Store. Careful wives show their good management otherwise than by offering their draper less than his demand. Fine ladies do not complacently let out the fact to their friends, as does Mrs. Delany in her first widowhood, that they got their court dress "a great pennyworth." Cheapening does not with us gain respect as a test of good housewifery, as we find it in foreign novels of domestic life. Nobody, in fact, bargains now except for the love of bargaining. And, except where the impulse is ungovernable, breaking through all laws of custom, ordinary buying and selling affords no room for its indulgence—in educated and polite circles, that is. It is a pleasure relegated to unlettered mediocrity.

Yet the love of a bargain lies too deep in human nature to be suppressed for want of a field. If there were no obvious vent for it, we might be sure beforehand that ingenuity would find one. Without entering here into the question how far the discontinuance of chaffering and higgling over the counter drives persons of this temper into that trick of overreaching on a large scale which is the theme of so many a City article in our day, we may all have observed the craving which sometimes seizes people to get more than money's worth for their money in scenes less congenial to its indulgence than shop or market, and precisely where a little offhand generosity belongs to the occasion. Wealthy men promoted to high place and conspicuous in general observation will stickle for petty savings and minute economies, will forget dignity and let credit go to the wall, in a determination to do things cheaply which the world expects them to do well. Women, important in their own eyes, and well to do, will find their amusement in small parsimonies on the same scene where their poorer neighbours play at lavish expense; a few shillings or sixpences being sometimes the test and exponent of either temper. For bargaining, being in its own way an intellectual pursuit, is independent of the amount and quality of the gain. It is a passion that may be indulged for its own sake; a game to be played for threepenny points, an exercise of skill so absorbing for the moment that lookers-on are forgotten. We cannot have everything in this world, and the most successful woman at a bargain cannot enjoy her triumph and keep her dignity at the same time. We may hold our state without spending our money, so long as we betray no hankering longings; but neither state nor magnanimity is compatible with certain modes of spending. This was felt by the grandees of old Spain to a quixotic extent, with which, indeed, we can feel no sympathy. When they made a purchase they threw down their gold and left the shop, not condescending to receive change, lest in this semblance of negotiation they should level themselves with their tradesman by trivial money dealings. Pride so ill becomes man, and comes to such a bad end, that, of the two, we prefer the equality that accompanies higgling and chaffering rather than the slack-handed dealing which argues contempt for one's fellow-creatures. Only it should be understood that the higgling is an equalizing process—a fact keenly realized on the socially inferior side, as the anecdotage and literature of the subject clearly shows, whether in the language of compliment or plain-speaking; whether it is Bob Jakin presuming to tell Mrs. Glegg that he always know'd she was a pleasant lady, or Luckie Mucklebackit reminding Monkbarns of his "nearness," or Miss Grisel and the fish-wife wrangling together in one tone and key like seagulls screaming and sputtering in a gale of wind. Wherever money dealings are discussed with an undisguised view to self-interest, and purchase becomes a conflict, there the distinctions of rank and station are for the time laid aside. Not that we would regard this as a serious objection to traffic for "pennyworths" in any field. We simply note it as a fact.

There are few people who have not felt the pleasure of a good bargain. Once in a way it is a useful experience; but it should have a sense of adventure and rarity in it to be harmless. Some men are as utterly without the spirit of barter as M. Huc describes the Tartars to be, and, for the want of this sharpening influence, they are as easy dupes as he pictures them to their keen rapacious Chinese neighbours. Yet his own dealings with this simple people furnish so apt a contrast to the grasping temper that we cannot do better than conclude with an example of their method of transacting business. The missionary having offered a Tartar Lama his scales to weigh the silver tendered in payment of a sheep, the Tartar stepped backwards and throwing up his hands cried out, "Above there is a heaven; below there is an earth, and Buddha is the master of all things. He desires all men to treat each other as brothers. You are of the West, I am of the East. Is that any reason why our dealing should not be frank and true? You have not cheapened my mutton, I take your silver unweighed."

RAGUSA.

THE voyage onward from Spalato, the voyage among the greater Dalmatian islands, leads, as its next natural stopping-place, to Ragusa. But he who would really take in the peculiar position of Ragusa will do well to pass it by on his outward voyage, to go on to Cattaro, and to take Ragusa on the way back. The wisdom of so doing springs directly out of the history of the city. The haven which is said—and we have no better derivation to suggest—to have given its name to *argosies* could certainly not give shelter to a modern argosy. Nothing but craft of the smallest kind now make their way to Ragusa herself; the steamers and everything else stop at the port of Gravosa, a mile or more off. He therefore who visits Ragusa on his outward voyage has to land at Gravosa and to make his way to Ragusa by land. He thus loses the first sight of the city from the sea which he has had at Zara and Spalato, and which at Ragusa is, setting special associations aside, even more striking than at Zara and Spalato. Before he sees Ragusa from the water, as Ragusa was made to be seen, he has already made acquaintance with the city in a more prosaic fashion. He will not indeed have had his temper soured by the inconveniences which Sir Gardner Wilkinson had to put up with eight-and-twenty years ago. There is no more delay at the gate of Ragusa, there is no more difficulty in finding a carriage to take the traveller from Gravosa to Ragusa, than there is in the most frequented regions of the West. Still, in such a case, the traveller sees Ragusa for the first time from the land, and Ragusa of all places ought to be seen for the first time from the sea. Seen in this way, the general effect of Ragusa is certainly more striking than that of any other Dalmatian city; and it is so in some measure because the effect of Ragusa, whether looked at with the bodily eye or seen in the pages of its history, is above all things a general effect. There is not, as there is at Zara and at Spalato, any particular moment in the history of the city, any particular object in the city itself, which stands out prominently above all others. We draw near to Zara, and say, "There is the city that was stormed by the Crusaders," and, though we find much at Zara to awaken interest on other grounds, the crusading siege still remains the first thing. We draw near to Spalato; we see the palace and the campanile, and round the palace and the campanile everything gathers. We draw near to Ragusa; the eye is struck by no such prominent object; the memory seizes on no such prominent fact. But there is Ragusa; there is the one spot along that whole coast from the Croatian border to Cape Tainaros itself, which never came under the dominion either of the Venetian or of the Turk. Ragusa will be found at different times standing in a tributary or dependent relation to both those powers, but it never was actually incorporated with the dominions of either. In this Ragusa stands alone among the cities of the whole coast, Dalmatian, Albanian, and Greek. Among all the endless confusions and fluctuations of power in those regions, Ragusa stands alone as having kept its place, always as a separate, commonly as an independent, commonwealth, from the break-up of the Byzantine power on those coasts till the day when the elder Buonaparte, in the mere caprice of tyranny, without provocation of any kind, declared one day that the Republic of Ragusa had ceased to exist. This is the history of Ragusa, a history whose general effect is as striking as any history can be. It is a history too, which, if we dig into its minute details, is full of exciting incident, but not of incident which, like the one incident in the history of Zara, stands out in the general history of Europe. There is, to be sure, one incident in Ragusan history which may claim some attention at the hands of Englishmen, and ought to claim more at the hands of Poitevins. Count Richard of Poitou, who was also by a kind of accident King of England, and who in the course of his reign paid England two very short visits, paid also a visit to Ragusa which was perhaps still shorter. But this again is an incident of mere curiosity; it had no general effect on the affairs of the world, though, if we accept the tradition that Richard rebuilt the cathedral, it certainly had an effect on the local affairs of Ragusa. Ragusan history then may either be taken in at a glance, and a most striking glance it is; or else it may be studied with the minute zeal of a native topo-

grapher. There is no intermediate point from which it can be looked at. In the general history of Europe Ragusa stands out, as the city itself stands out to the eye of the traveller, as the one city of the Dalmatian coast where the Lion of St. Mark is not to

As is the history, so is the general effect. As we sail past Ragusa, as we look at it from any of the several points which the voyage opens to us, we say at once, Here is one of the most striking sights of our whole voyage; but we cannot at once point our finger to any one specially striking object. There are campaniles, but there is nothing special about them; there are castles and towers in abundance, but each by itself on any other site would be passed by without any special remark. What does call for special remark and special admiration is the city itself, at once rising from the sea and fenced in from the sea by its lofty walls. It is the shore, with its rocks and its small inlets, each rock seized on as the site of a fortress. It is the background of hills, forming themselves a natural rampart, but with the artificial defences carried up and along them to their very crest. Here we are not tempted, as we are tempted at some points of our voyage, to forget that our voyage is one by sea, and to fancy that we are floating gently on some Swiss or Italian lake. Ragusa does not stand on a deep inlet like Cattaro, on a bay like Spalato, on a peninsula like Zara, fenced in by islands on one side and by the opposite shore of its haven on the other. Ragusa does indeed stand on a peninsula, but it is a peninsula of quite another kind; a peninsula of hills and rocks and inlets, offering a bold front to the full force of the open sea. One island indeed, La Croma, lies like a guard-ship anchored in front of the city, but we feel that La Croma is strictly an island of the sea. The islands off the more northern coast form as it were a wall to shelter the coast itself. La Croma fills no such function. The city of argosies boldly fronts the sea on which her argosies were to sail, and fiercely do the waves of that sea sometimes dash upon her rocks. Ragusa seems the type of a city which has to struggle with the element on which her life is cast, while Venice is the type of a city which has, in the sense of her own yearly ceremony, brought that element wholly under her dominion. As we look up from the sea to the mountains, we think how purely Ragusa was a city of the sea. Venice was an inland power on that Italian land off which she herself lay anchored. She might pass for an inland power even on the Ragusan side of the Hadriatic. The Dalmatian territory of Venice looks on the map like a narrow strip; but, compared with the Ragusan coast, the Venetian coast has a wide Venetian mainland to the back of it. But Ragusa lies at the foot of the mountains, and the crest of the mountains was her boundary. She has always sat on a little ledge of civilization, for five centuries past on a little ledge of Christendom with a measureless background of barbarism behind her. Those hills, the slopes of which begin in the streets of the city, once fenced in a ledge of Hellenic land from the native barbarians of Illyricum. Then they fenced in a ledge of Roman land from the Slavonic invader. Lastly, they still fence in a ledge of Christian land from the dominion of the Infidel. This has been no mean calling for the heights which look down upon Ragusa. It is well to climb those heights, best of all along the road which leads from civilization to barbarism, from Christendom to Islam, and to look down on the city nestling between the sea and the mountains. The view is essentially the same as the view of the city from the sea. Rocks, inlets, walls, and towers come out in new and varied groupings, but there is still no one prominent object. La Croma indeed, with its fortress, its fallen monastery, its old tradition of the wandering crusader, its new memory of the Archduke who was cajoled into becoming a Mexican party leader, now comes in as a prominent object. But it shows by its very prominence the difference between this point of the Dalmatian coast, with its one island, all but invisible on the map, lying close to the shore, and the two archipelagos, one of small and obscure, one of great and historic islands, which the voyager has already passed by. It would be well if we could look on Ragusa both from the sea and from the mountains before we approach the city by the one possible way to reach it, by the road which leads from its port of Gravosa. This last is a picturesque haven of thoroughly Dalmatian character, lying on a smooth inlet with the fringe of a small fertile plain between the water and the mountains. The road leads along among villas, which gradually grow into a suburb, till we reach the gate. But before we reach the gate we see, what there was not in the time of Sir Gardner Wilkinson, carriages standing for hire, carriages no very long drive in which will take us over the borders of Christendom. In that suburb too the traveller will most likely take up his quarters—quarters, if he has any good luck, looking down straight on the rocks and waves. And there, in war time at least, he will be sure to hear both the latest truths and the latest fables. But he is still outside the city. No city brings more home to us than Ragusa the Eastern hyperbole of cities great and fenced up to heaven. We must leave the military architect to discuss their military merits or demerits. To the non-professional observer they seem to belong to that type of fortification, between mediæval and modern, which in these lands we naturally call Venetian, inapplicable as that name is at Ragusa. But they have clearly been strengthened and extended in more modern times. The city lies in a kind of hollow between the lower slopes of the mountain on one side, and a ridge which lies between the mountain and the sea, and which thus adds greatly to the appearance of the fortifications as seen from the sea. The one main street of Ragusa thus lies in a valley with narrow streets running down towards it on both sides. The two ends lead towards the two gates, still strong and still guarded, reminding us that we are in what is really a border city. Within the walls the general aspect of the city is comparatively modern. Most of the buildings, the metropolitan church among them, were rebuilt after a great earthquake in 1667. Such remains however of old Ragusa as are still left are of such surpassing interest in the history of architecture that we must keep them for a more special examination.

The history of Ragusa, as we have already said, is of a kind which must either be taken in at a glance or else dealt with in the minutest detail. All Dalmatian history for a good many centuries wants a more thorough sifting than has ever been brought to bear upon it. It wants it all the more because it is so closely connected with early Venetian history, than which none is more utterly untrustworthy. But at Ragusa, and indeed before we reach Ragusa, while we are still among the islands, there is one point which distinguishes this part of the voyage from its earlier stages at Zara and Spalato. As soon as we pass Spalato, as soon as we pass the greatest monument of the dominion at Rome, we find ourselves in a manner within the borders of Hellas. The endless islands along the northern part of the Dalmatian shore are many of them bare and uninhabited rocks; none of them have any history. Some of the Croatian islands indeed have somewhat of a history, but with these we are not now dealing; the barren archipelago of Zara never could have had any. Things change in this respect when we pass Spalato and find ourselves among the greater islands, several of which have a history. We are now within the range of Greek colonization, though of Greek colonization only in its last stage. Issa now Lissa, Pharos now Lesina, Black Korkyra now Curzola, among the islands, and Epidauros on the mainland, were all of them undoubted Greek settlements, though Issa and Pharos, the only ones to which we can fix a positive date, were colonized only in the first half of the fourth century, and Dionysios of Syracuse had a hand in their colonization. Still they were Greek cities. Meleda, the long island with hills rising like a comb, can have its claims to be acknowledged to be the true place of St. Paul's shipwreck admitted only on the condition of being shut out from the Hellenic fellowship, even though its barbarians were of a mood which led them to show no little kindness to strangers. In the history of Polybios, Pharos and its Dêmêtrios play a considerable part. These islands form one of the highways by which Rome advanced to the possession of Illyricum, Macedonia, and Greece. Pharos was a Parian colony; the name of Epidauros at once proclaims its metropolis, and the worship of the healing god extended to the colony. Epidauros is now *Ragusa-Vecchia*. The old Epidaurian colony fell, like Salona, before the barbarians. Its inhabitants had no ready-made city to flee to, but they founded a city on the rocks which became Raousion or Ragusa. Here, as usual, our Imperial guide helps us to one of his strange etymologies. With him Epidauros has sunk into Πίτυρα, and the city on the rocks which its exiles founded was first called from its site Λαύσιον, which by vulgar use (ἡ κοινὴ συνήθεια, ἡ πολλάκις μεταφθείρουσα τὰ ὀνόματα τῇ ἐναλλαγῇ τῶν γραμμάτων) became Ῥαούσιον. He tells us that, ἐπεὶ ἐπάνω τῶν κρημνῶν ἵσταται, λέγεται δὲ Ῥωμαϊστὶ ὁ κρημνὸς λαῦ, ἐκλήθησαν ἐκ τούτου Λαυσαῖοι, ἤγουν οἱ καθεζόμενοι εἰς τὸν κρημνόν. What tongue is meant by Ῥωμαϊστί? It is only because the strange form λαῦ seems to come one degree nearer to λᾶας ἀναβὰς than to anything in Latin, that it dawns on us that it means Greek. But, under whatever name, the city on the rocks, small at first, strengthened by refugees from Salona, grew and prospered, and remained one of the outlying Roman or Greek posts which in the days of Constantine, as now, fringed the already barbarian land.

For some centuries after the time of Constantine Porphyrogenitus, the history of Ragusa defies abridgment. It is one web of intricate complications between the Emperors of the East and the West, the Republic of Venice, the Kings of Hungary, Dalmatia, and Bosnia. Somewhat later the story begins to be more intelligible when the actors get pretty well reduced to Venice, the Turks, and the Empire in a new form, that of Charles the Fifth. The Republic contrived, which must surely have needed a good deal of skill, to keep on good terms at once with Charles and his son Philip and with their Turkish enemies. We believe we are right in saying that Ragusa, though never incorporated by anything earlier than the dominion of Buonaparte, was at one time in a kind of dependent relation both to Venice and the Turks. At an earlier time the commonwealth for a short time received a Venetian Count. He was doubtless only meant to be like a foreign *podestà*, but Venice was a very dangerous place for Ragusa to bring a *podestà* from. In her later days Ragusa must be looked on as being under the protection of the Porte, but it was a protection which in no way interfered with her full internal freedom—such freedom at least as is consistent with the rule of an oligarchy. The geography of Dalmatia keeps to this day a curious memorial of the feeling which made Ragusa dread the Turk less than she dreaded Venice. To this day the Dalmatian kingdom does not extend continuously along the Dalmatian coast. At two points territory which is nominally Turkish comes down to the sea—at Klek, at the bottom of the gulf formed by the long Ragusan peninsula of Sabioncello, and at Sutorina on the Bocche di Cattaro. These two points mark the two ends of the narrow strip of coast which forms the territory of Ragusa. Rather than have a common frontier with Venice at either end, Ragusa willingly allowed the dominions of the Infidel to come down to her own sea on either side of her.

As for King Richard, the Ragusan story is that he built the cathedral which was destroyed in 1667. From Roger of Howden it is not at all clear that he was at Ragusa at all, though he clearly meant to go thither, having hired a ship at Corfu expressly to carry him to Ragusa. But he actually landed "prope Gazere apud Raguse," whatever may be meant by that, whether Zara or any other place. But the different accounts of Richard's Hadriatic adventures are told with so much confusion and contradiction that they seem to have puzzled Professor Stubbs himself. We will therefore not commit ourselves to any view till the whole chaos of early Dalmatian history shall have been put into order either by Professor Stubbs himself, or by somebody else of a like critical gift.

THE PROGRESS OF PUFFERY

IT must be presumed from the vast number of puffing circulars which are daily scattered broadcast among certain classes of society that this method of cultivating customers is found to answer its purpose. The expenditure which is thus incurred for paper, printing, and the means of distribution must be enormous, and it is impossible to conceive of any sane man of business making such an investment unless it yielded him a satisfactory return. On the other hand, the fact that the public allows itself to be influenced in this manner would appear to indicate a lamentable degree of weak-mindedness and gullibility on the part even of comparatively educated and intelligent people. At the present moment the system is carried out with great energy and assiduity, and the intensity of the competition seems to be putting a severe strain on those who are engaged in it. Language, after all, has its limits, and when one tradesman has used up every term of wild panegyric he can think of in the description of the unapproachable perfection of his goods, it is difficult for others to get ahead of him. In this way the force of language is continually exhausted, since the value of a phrase depends upon its originality, and, as soon as it becomes the common jargon of the trade, it is comparatively useless. A great deal of ingenuity has consequently to be exercised in devising new methods of making an impression on the public. If familiar phrases and forms of address have lost their virtue, other forms and phrases must be provided. Every dealer is of course entitled to suppose, and to say, that his goods are immensely superior to those of other people, but this assertion has in the course of generations got rather the worse for wear. It is necessary therefore to give the ancient commonplaces a new zest by some peculiarity of style, and the constant demand for novelty must certainly be very exhausting to the brain, which perhaps accounts for some of the eccentricities of modern advertisements. The whole stock of superlatives is gradually worked out, and new ones have to be found. There are some persons who seem to think that the choice of a lucky adjective ought to be protected by law as a sort of trade-mark; but in these days of spelling-bees it can hardly be contended that the English dictionary is not free to everybody. There was not long ago a question as to whether a particular stout was "Nourishing," in a sense different from that in which the word could be applied to any other kind of stout; and it appeared that this particular stout was, except for the label, only some of the ordinary stout made at a brewery which supplied hundreds of public-houses, and the liberty of the subject was vindicated by a decision giving the right to bestow the term "Nourishing" on any article of food or drink that was not proved to be absolutely poisonous. It is on this side that puffery is weakest; for the adjectives of a country are the common property of its inhabitants, and even of those of other countries if they care to adopt them. If the favourite phrases of the art could only be patented, it might be a fine thing for the patentees; but the value of extravagant laudation is apt to be impaired by the universal use of the terms employed.

There could hardly be a more striking illustration of a revolution in popular opinion than the curious reversal which is now so flagrantly exhibited of the familiar proverb that "good wine needs no bush." At the present time it would seem as if the wine-merchants who especially pride themselves on the super-excellence of their stocks had lost all faith in this very sensible maxim. There are still, we suppose, wine-merchants who do not think it necessary to placard the walls and swamp the breakfast-tables with puffs of their stock-in-trade; and we imagine that, if they really sell that rare article, honest wine, they do not suffer from want of good customers, who judge of a wine by what it is, and not what it is said to be by an interested vendor. Every householder in certain parts of London now receives about a hundredweight of wine-merchants' circulars in the course of the year, and if he is of a thrifty turn of mind he may get a Christmas-box for himself out of the waste-paper. All, however, that such a circular tells us is that the man who has wine on sale is of opinion that it is the most wholesome, delicious, and cheapest wine in the world; and yet it would seem that there are many people silly enough to accept such an assurance with implicit faith. A very large number of persons have no doubt lately received a pamphlet headed "Important Correspondence," which curiosity may have induced them not immediately to throw away, especially as a "N.B." further announces, in a somewhat comprehensive way, that "This pamphlet supersedes all previous pamphlets." It turns out that this "Important Correspondence" is a letter from a reverend baronet in Norfolk, who states that he "is very particular as to the wine he drinks," that he finds the advertiser's sherry suits his taste, and has had a favourable account of it from an analyst. In the first instance, however, the reverend gentleman was disposed, he tells us, to regard the advertisement as "a most egregious piece of humbug," and we must confess that we should probably have regarded it in the same way. We have nothing to say of this particular wine, because we know nothing; but it is difficult to understand why, on such evidence, anybody should believe the assertion that it is the only sherry fit to drink. Some certificates are also appended from various chemists and doctors; but we were not previously aware that the highest class in either profession allow their names to be used for advertising purposes. Nor does such a phrase as "the attributes of perfection" strike us as having the ring of scientific precision. Then it is announced, on the authority of the dealer, that this sherry enjoys "unbounded popularity," which, if true, would seem to show that all this advertising is a waste of money. It is further stated to be "the wine long looked for by the public press, experts, connoisseurs, invalids, the nobility, the clergy, the gentry, clubs, messes, and by probably twenty thousand of the public in the United Kingdom." If the superior excellence of this wine is so widely appreciated, it may be asked why does the dealer go to so much expense to demonstrate the virtues of his liquor. We must confess, however, that some of the testimonials which follow this announcement go far to prove that this sherry must be in some ways really a very remarkable wine. Among other certificates which are quoted are those of the *Rock* and of the *Church Review*, and we imagine that there is no previous case in which these highly differentiated journals have ever before been found in accord. Like the conspirators in the play, however, when they do agree, their agreement is wonderful. The *Church Review* finds it quite consistent with Anglican principles to warrant the perfect orthodoxy of the liquor recommended; and the *Rock* is, from the Low Church point of view, equally enthusiastic as to the soundness of the article. It is stated in the prospectus that the best judges of the wine are those who have gouty or uric acid tendencies, but unfortunately there is no information as to the relative development of these uncomfortable tendencies on the part of our theological contemporaries. We should hardly have suspected the *Rock* of the gout, but it may have some other acid tendency which makes it an authority. We should certainly say from its tone that, if it really drinks this sherry, the beverage does not improve its temper.

One of the most brilliant examples of recent advertising literature is supplied by a firm of grocers who not only take the public fully into their confidence as to the real qualities of their teas, but also pathetically appeal to its sympathy for themselves as self-sacrificing philanthropists. These high-minded purveyors take their stand upon their extreme and disinterested frankness in dealing with their customers. They have no secrets from the world, and are prepared to avow the defects as well as the perfections of their wares. Some of their teas are "the finest the world produces," and all their teas are of course in their way the very best that can be procured. Still they are too scrupulous to pretend that every description of tea in their stock will satisfy everybody. For instance, there is the Kyshow Congou, "a brisk, rich Pekoe-flavoured tea, perfect in strength and quality, beautifully manipulated, full of flavour, and possessing a pungent, nutty flavour, which is exceedingly grateful to the palate." This is indeed "a prince among teas." Or there is for more delicate palates the Moning sort, "soft, silky, exquisitely delicate in flavour, and drinks full and round." These intelligent tradesmen, however, while happy to place "the finest tea in the world" at the disposal of those who can appreciate it, are also aware that there are people who are content with tea which falls something short of this ineffable perfection, and for these they cater too. The Assam Congou is "very strong and drinks full in the mouth," but the firm feels bound to acknowledge that it is "a little coarse," and, being "rather peculiar, is not appreciated by all." Indeed, it insists upon warning any intending purchaser that "it requires an acquired taste." Then again, though there can be no harm in mentioning that the Scented Pekoe has "peculiar piquancy and sharpness of flavour," honesty requires that it should also be stated that it is, after all, a "fancy tea," and "more frequently used as a curiosity and experiment than by the tea-drinking public." Another scented tea is, it seems, "less grateful to the palate than to the other senses"; and there is also a further variety which is "rather plebeian," though no doubt it will be readily understood that the most plebeian tea sold by this establishment is infinitely superior to that of any other shop. It would be invidious not to accept the candid admission of defects in some teas as a conclusive proof of the rigid impartiality of the vendors in describing those other teas which are "the finest in the world." But this is not the only ground on which they appeal for support. It appears that the testing of tea "is no light work, but, on the contrary, a matter of continual application, month by month, week by week, and day by day"; and that it also involves "a great strain on the physical powers." "Indeed," they add, "it is not too much to say that an equal amount of study is required to select a supply of tea of uniform quality for a large trade as is needed to paint a picture or to write a book"; and we can well believe that the concoction of eloquent advertisements is even more wearing. It must not be supposed, however, that the dealers "arrogate to themselves an exceptional genius"; they confine themselves to the modest assertion of the simple fact that they sell "the best

and purest teas," and that all other tea-dealers are nowhere by the side of them. This ingenuous candour must necessarily command confidence and sympathy.

As one other example of the absurd puffing which is thought necessary for every speculation in these days, we may take the prospectus of a new skating-rink which has just been circulated. The introductory paragraph setting forth that the object of the Company is to provide "within easy reach of the Clubs and Parks, and residential quarters of the West-End, a Skating Rink, with such accessories from time to time as may render the establishment an attractive and agreeable place of resort and recreation," is no doubt comparatively modest, though the literary style is high. But, as we go on, we are assured that "the advantages of the site cannot be surpassed"; that the skate which is to be used in this rink possesses "advantages and improvements over any of the numerous skates already patented"; that the club-house will be of a "distinctive and unique character," and "will provide all the accommodation and conveniences usually afforded by a club of the highest class," with, in addition, "the agreeable feature of communicating with a large building devoted to the purpose of healthy exercise and entertainment." It may occur to some sceptical minds that possibly the agreeableness of this feature may depend on whether a man happens to want comfort and repose at a club or something else, and also on the character of the exercises and entertainments to be provided in the large building. It is quite possible that a taste for select society and quiet might not be fully gratified by the proximity of what to persons of other tastes may seem a bower of bliss. "Special attention" will also, we are told, "be devoted to the question of music." The orchestra will, of course, be of "the highest character," and it is perhaps needless to add that "from time to time selections of music of the highest class will be performed." The phrase "from time to time" possibly implies that at other times the selections of music may not be of the highest class, and it may be conceived that it will be difficult to sustain the very highest standard on all occasions. There will also be at intervals during the season "fancy dress fêtes, illuminated skating entertainments, bazaars, conversaziones, and other artistic *réunions*, under the auspices of the Club, acting in concert with the Council of the Rink." This Council, by the way, is another great feature of the enterprise. It appears to consist chiefly of captains and country gentlemen; and, as there are about a hundred of them on the Council, it will be understood that this is a conclusive guarantee of the unimpeachable respectability of the "ladies and gentlemen" who will be elected by that body. All this leads up to the conclusion that "under these circumstances, it may reasonably be anticipated that the ——— Skating Rink will become one of the most attractive and enjoyable lounges and resorts of the metropolis; and, looking at its unique character and situation, it cannot fail to prove not only successful from an artistic and popular point of view, but highly remunerative as a commercial enterprise." This is no doubt in the highest style of that shopkeeping eloquence for which Regent Street is famed; but it may be remarked that one or two instances have recently been before the public in which the promises of high-flown prospectuses have not exactly been fulfilled. The Royal Aquarium, for instance, has not been lacking in literary power, though it is unfortunately obliged to postpone *sine die* the opening of its tanks.

PROPOSED CANONIZATION OF JOAN OF ARC.

THE proposal to canonize the Maid of Orleans is not simply, as the *Times* and its Correspondents seem to imagine, a bid for French enthusiasm against the usurpations and encroachments of the great Protestant Empire which has humiliated France and the Church. This may no doubt be one reason for reviving the project at this moment. But the canonization of both Joan of Arc and Columbus was under discussion more than two years before the outbreak of the Franco-Prussian war, as was at the time noticed in our own columns (February 29, 1868). In the May of 1868 the Archbishops of Rouen and Bordeaux and the Bishop of Orleans celebrated with much solemnity the anniversary of the martyrdom of Joan of Arc, and representations were made at Rome both as to her claims and those of the discoverer of the New World for a niche in the great temple of Catholic hagiology. The special ground reported to be urged by Cardinal Donnet in the case of Columbus was certainly rather a strange one. It was explained that sailors, not being Italians, had long been in want of a heavenly patron; St. Andrew, who is supposed to fill that office, being apparently disposed from his close connexion with St. Peter to confine his attention too exclusively to the countrymen of the Holy Father. There are other and more plausible considerations, however, which might very conceivably weigh with the Roman authorities in both cases, and especially as regards the fair claimant with whom we are just now immediately concerned. The alarm which appears, if we may judge from the *Voce della Verità*, to have come over ecclesiastical authorities, both French and Roman, lest English susceptibilities should be roused by investing the brows of *la Pucelle* with the aureole of martyrdom, may at all events be safely dismissed from their minds. "France and England," as that journal observes, with a caution and moderation not always equally conspicuous in its utterances, "have forgotten their rivalry of centuries, and *perhaps* the time has come for taking a step forward, without giving umbrage to England, by initiating the canonization of Joan of Arc, if she was really a saint." We are happy to be able to reassure our contemporary on this point. England will not take umbrage, and has the less need to do so inasmuch as, if truth must be spoken, France had a good deal more than ourselves to do with burning the young enthusiast; but of that we shall speak presently. There are, indeed, some daring sceptics who maintain that she was never burnt at all, some nameless victim being adroitly substituted in her place; and the *advocatus diaboli* may be expected, when his time for speaking comes, to make what capital he can out of this Straussian version of her history. But Rome will know how to deal with such audacious rationalism as it deserves. As to her spiritual claims to a place in the Calendar, which have been discussed—and, we regret to add, dismissed—by the *Times* with the gravity befitting so high and experienced an authority on the science of the Saints, we shall not presume to say a word, for in such sacred matters we make no pretension to the superior wisdom which inspires the infallible oracle of Printing-House Square. The *Voce della Verità* informs us that the Maid heard mass daily with great devotion, fasted three times a week, prayed constantly, and was fervent in approaching the Sacraments. It seems rather hard, therefore, that the *Times* should so peremptorily overrule her claims with the magisterial assertion that she "was not in any intelligible sense of the word a saint." However, with these high matters we do not meddle here.

The history of Joan of Arc may be told in a very few words. Born, according to Lingard, about 1410, at Domremy, she began while still a girl to hear heavenly voices, believed to proceed from St. Margaret and St. Catherine, and exhorting her to deliver her country from the yoke of the foreigner. At the age of twenty she presented herself before the young King, and assured him of her Divine commission to raise the siege of Orleans and to see him crowned at Rheims. Charles hesitated, but eventually accepted her services, after a theological Commission had examined and approved her supernatural pretensions. She put herself at the head of the troops and achieved all that she had promised. The besieging army retired from Orleans, and the King was solemnly anointed and crowned at Rheims, while she stood with her sacred banner beside the throne. She then declared that her mission was accomplished, and requested permission to return home. But Charles, who probably had little faith in her mission, thought her assistance too valuable to be dispensed with, and refused to let her depart. She remained therefore with the army, but disclaimed any further inspiration. And the event proved that her good genius had forsaken her. Soon afterwards she fell into the hands of the Burgundians, who sold her to the English, and so the tragical end came about. In that age there was nothing unusual, or considered at all discreditable, in the execution of prisoners of war, and Joan only a few days before she was herself captured had ordered the instant execution of a French general who fell into her hands. However in this case there was evidently felt to be a difficulty. The English generals were probably, as Lingard suggests, afraid of the influence exercised by her preternatural character and achievements on the superstition of their own followers, and she was handed over to an ecclesiastical tribunal. The Bishop of Beauvais was a devoted adherent of their cause, but he appears really to have considered the unfortunate maiden, as Rymer records his words, "a disciple and lyme of the fiende, that used false enchantments and sorcerie." He condemned her accordingly, and the University of Paris had the incredible baseness to confirm the sentence. Still, there was considerable hesitation about proceeding to extremities, for nearly a twelvemonth was allowed to pass before her public burning in the market-place at Rouen, May 30, 1431. Twenty-five years later, at her mother's request, Pope Calixtus III. appointed the Archbishop of Rheims and Bishop of Paris to re-examine the question, when the previous judgment was reversed and her memory cleared from all stigma of heresy and witchcraft. It may perhaps be thought strange that during the next two centuries, and while France was the leading nation of Catholic Europe, and was studiously courted at Rome as the eldest daughter of the Church, nothing more was done for her honour. That on Roman Catholic principles she must have been the special emissary either of Heaven or hell can hardly admit of question; and the latter view, which is preserved in Shakspeare, was probably the current one in this country at the time and for long afterwards. Meanwhile, to doubt the perfect sincerity of her own belief in her miraculous powers would be the shallowest of scepticisms. And we may well say of her mysterious "voices" what so sturdy a Protestant as the late Sir James Stephen did not scruple to say of the very similar visitations recorded in the Life of St. Francis Xavier:—"Whatever may be thought of these voices from within, it is at least clear that nothing magnanimous or divine has yet proceeded from those who have listened only to the voices from without."

But, putting aside the purely religious aspects of the question, it is of some interest to inquire what motives other than of a purely political or national kind may have prompted the selection of Joan of Arc, and, if he is to be included, of Columbus, for insertion in the bead-roll of the Saints. One thing is obvious on the surface. Both these candidates for celestial honours represent lay and not clerical society, and not only so, but represent also the active, as distinct from the passive and contemplative, virtues of the Christian character. Now it is a fact, of which any one who will take the trouble to turn over a Breviary Calendar, or to examine such a work as Butler's or Baring-Gould's *Lives of the Saints*, may easily

convince himself, that the immense majority of the canonized Saints are either priests, or monks, or nuns. And of canonized laymen a large moiety are either kings or persons of high rank, who had powerful advocates to press their posthumous claims on the attention of the Roman Court. It is only the natural sequel of this that the virtues thus singled out for public recognition and commended to the reverence and imitation of the faithful should be chiefly of the ascetic and clerical, or, as it is sometimes objected, feminine, type. We do not say this in disparagement of them. No doubt, as we had occasion to observe the other day in a different connexion, very lofty excellences have been exhibited in the priesthood and the cloister. But there is another class of virtues, of which St. Louis may be taken as a type among the canonized, which find their natural home elsewhere, and have not been so readily, or certainly not so largely, rewarded with the honours accorded by the Church, whether to the living or the dead. They are the virtues, as theologians would say, of the natural, rather than the supernatural, order; not the peculiarly "Evangelical" virtues—for they were not first learnt from the Gospel—but such as must always find a place in any ethical code which aspires to completeness, and which the Gospel cannot fairly be said to discountenance, because it had no special occasion to inculcate afresh what was already in danger of being exaggerated rather than ignored. Conspicuous in this catalogue stand courage, patriotism, and a generous spirit of enterprise; the sort of qualities, in fact, to which the ancients paid homage in the fabled exploits of Hercules, and which a modern authoress has undertaken to illustrate in a revised version of the story of Jack the Giant-killer. Such energies may obviously be devoted to the highest purposes of Christianity, and therefore to the highest interests of the Church. It is significant that the *Voce della Verità*, which represents the Vatican, "sees in this sublime figure (of Joan of Arc) not a French heroine, but a heroine of the Church *and of humanity*." There is certainly something heroic about the Maid of Orleans, and we fail to perceive why the fact of her heroism being displayed for national rather than strictly religious objects should disqualify her, as the *Times* insists, for a place among the Saints. But it is true that it is not the kind of heroism which the Church has chiefly delighted to honour. It was the self-sacrificing heroism of an Epaminondas or a Regulus, but it drew its inspiration from the most profoundly Christian source. "Candour," it has been remarked by a high Ultramontane authority in this country, "is neither universally nor distinctively characteristic of the Saints," and we presume he would say the same of other "natural virtues." But it was precisely in the natural and masculine virtues of courage, self-sacrifice, and patriotism that the warrior Saint of France excelled, though she constantly traced them to a supernatural motive. And the same remark applies *à fortiori* to Columbus, in whom the mystic element was far less prominent. Both of them were unquestionably devout, and their devotion was of the most approved and orthodox kind. Columbus, like Ignatius Loyola, had originally desired to make a pilgrimage to the Holy Land, but the one exchanged his scheme for the discovery of a new continent, the other for the foundation of a new Order, with the express aim in either case of propagating or of defending the faith. Still it remains true that the canonization of Joan of Arc or of Columbus would mark something of a novelty in the attitude of the Church towards the world. The Pope, we know, sternly refuses to come to terms with modern civilization, but he would by this act have shown himself better able than many of his predecessors to appreciate the temper and standard of modern society. Patriotism does not hold a high place in the ethical code of Ultramontanes, but they can hardly venture henceforth to speak lightly of it if Frenchmen are bidden by infallible authority to invoke the Maid of Orleans.

SOME WEST LONDON MANORS.

THE suburbs of London fared better in the original Domesday survey than they have done in the modern imitation. The new book takes no notice of them, unless it be a notice to call them "the metropolis." But the old surveyors devote a little space to the hundred of "Osulvestane," in which are most of the districts that go to make up the so-called "metropolis." To distinguish the suburban portion from the City seems to be the intention of those who thus steal away Canterbury's good name. Certainly even the misuse of the word is less confusing than any attempt would be to separate the elemental villages of which London now consists. If we confine our attention to the west only, we find such old places as Holborn, St. Giles's, Marylebone, Kensington, and Charing, not to speak of the City of Westminster; and, besides these, some new places, like Hanover Square, Piccadilly, South Kensington, and Westbourne, where no ancient foundations existed to be built upon. Merely taking the manors which go to compose this vast region, it is not a very easy task to find the real owners, and though a few broad features may be made out, the details of such a survey must remain obscure. Take, for example, the manor of which Marylebone Park was the chief feature. When the Regent's Park was formed the Crown was found to be the owner of nine undivided shares of the twenty-four into which the original manor had been portioned. The influence of the Crown, therefore, in reforming the district must have resembled that which England will now exert upon the affairs of the Suez Canal.

There was a beautiful simplicity in the early manorial subdivision of the hundred of Osulston which, unfortunately for the purposes of modern inquiry, has been wholly lost at the present day. There were twenty manors; the King had none; eight were held by laymen, and the rest belonged either to St. Paul's, London, St. Peter's, Westminster, or some other religious foundation. The King was returned as the owner of twelve acres and a half of "nanesmanesland," of the value of five shillings yearly, and as receiving the rents of thirty-two "cotars," besides six shillings a year from one William the Chamberlain for his vineyard. The manors on which the wealthiest districts now stand belonged from very early times to Westminster Abbey; not only "villa ubi sedet ecclesia S. Petri," and the distant Hampstead, with Belsize, probably a sub-manor, but Paddington also, and Hyde, afterwards divided into the three manors of Hyde, Neate or Neyte, and Ebury or Eybury; but all we learn in Domesday itself is that the Abbey had thirteen hides and a half in Westminster. Tyburn belonged, in part at least, to the Abbey of Barking; Kensington was given by one of the Veres to the Abbey of Abingdon; but before the suppression of the monasteries there was little land left between London and Westminster which did not acknowledge the Abbot of Westminster as its lord. The Savoy manor stretched from Temple Bar to Charing Cross, on one side of the way, but the Abbey estates began with Covent Garden, and included all that we know as Long Acre, Paddington, Hyde Park, Chelsea, Earl's Court, Pimlico, Belgravia, Grosvenor Square, and Knightsbridge. It would hardly be possible to form too extravagant an estimate of the present annual value of these Abbey lands. The great wealth of the three wealthiest English Dukes is chiefly derived from the possession of small portions of them—portions so small, indeed, that of one of them, the farm which was the centre of the manor of Ebury, we know that it was let after the suppression for twenty guineas a year. How it came to Mr. Davies no one seems to have recorded; but when his daughter, Mary Davies, married Sir Thomas Grosvenor, just two hundred years ago, it would have been impossible to foretell what an inheritance it has since become. Davies Street runs from Oxford Street to Berkeley Square, and preserves the name, having probably been so called first in 1725, when Sir Richard Grosvenor, a great builder in his generation, laid all the district under brick and mortar between "Tyburn Lane," now Park Lane, and Bond Street. In the July of that year Sir Richard called together his friends and neighbours, including those who had built and those who had taken his houses, and after a sumptuous entertainment he proceeded to give names to the streets and the squares which up to that time had been known as Grosvenor's Buildings. In the same year Sir Richard, who was uncle to the first Earl Grosvenor, obtained leave to open a gate from his new town into Hyde Park. He did so where the Artillery Barracks stood, and near the Chelsea Water Company's circular reservoir (not so long since abolished), the site of which is still marked by the sunk garden with a marble fountain. His selection of names for his new streets was not quite what might have been expected. Except in "Grosvenor Square" and the two "Grosvenor Streets," we have little reference to the titles or estates of the owner. Brook Street was called, like Conduit Street, from the circumstances of the site. At Mount Street there was a mount which may yet be traced; and Green Street, like Park Street, may be taken as a reference to the recent character of the place. Duke Street and Audley Street owe their names to the quarters outside the manor from which they led, and were probably named by a different authority; but the invention of Sir Richard seems to have failed when he was reduced to add another to the many Chapel Streets already in existence, and in North Row and South Street to indicate the geographical limits of his new suburb. When, in the days of the late Lord Westminster, the second great portion of the manor of Ebury was covered with houses, an abundant supply of names was afforded by the titles of the Marquess and those of all his relatives, by their Christian and surnames, by their country seats, and even by the real or supposed names of their remote ancestors. Thus we have Hugh Street and Lupus Street and Chester Square, for the great Earl Hugh was reputed the uncle of the first "Gros Veneur." Halkin Street and Motcomb Street, like Eaton Place and Wilton Square, are called after castles and halls in distant counties, while various alliances of the family are commemorated in the use of such names as Moreton, Churton, and Stanley; and sub-lessees have given theirs to other places.

The second division of the Abbey manor of "Eia," or Hyde, was turned by Henry VIII. into Hyde Park. He had obtained it by exchange from the Abbot, together with Ebury and Neate, for the site of Hurley Priory in Berkshire, one of the smaller houses first dissolved. We may be certain the Abbot did not make by the transaction, but it must also be remembered that the manors bore much the same relation to the London of that day that Richmond or Chingford bears now. What we call the Park was in all probability half heath and half marsh, traversed by at least two brooks, and but imperfectly divided from the barren, uncultivated moor on the north through which ran the roads to Reading and Edgeware. When Henry came to live at St. James's he had from the gate an uninterrupted view towards the north and the north-west, and may have been able to distinguish frequent processions along the ridge of the hill, and subsequent indications that his officers did not spare faggots and gibbets in endeavouring to obtain that uniformity of religious belief which the King was supposed to desire. But Hyde Park did not long remain desolate. Early in the last century an avenue of walnut-

trees of great size showed that some attention must have been paid to the plantation, and a wall separated the Park itself from the neighbouring manor of Paddington. In the picture of the execution of the Idle Apprentice Hogarth has given us one of the few extant views of the Tyburn corner, and the wall is well lined with spectators. Within it was a spot reserved for the military discipline of the *fusillade*; and where the Marble Arch now stands many a recalcitrant soldier has shed his blood for the good of an ungrateful country. Though Hyde Park has always, except for a short interval during the Commonwealth, been the property of the Crown, the people have constantly exercised their voice in its management, and have not hesitated to grumble loudly, and it must be confessed effectually, when any proposal has been made to build on it, or to curtail the liberty of assembly within its boundaries; but, in speaking, as some do, of its enormous value for building purposes, it is only right to remember that the open space gives their value to the neighbouring districts, and that to turn Hyde Park into squares and streets would be to ruin the surrounding manors, and possibly not to draw fashion to the new suburb.

The third portion of the great manor of "Eia" was early separated, under the name of Neate or Neyte. The exact meaning of the word is uncertain, but it cannot be doubted that some reference, more or less distinct, is made in it to the name of the original manor. At its north-eastern side it was divided from Ebury by the Bayswater or Westbourne, now merged in the Serpentine, and, if it is ever safe to guess, we may put aside all the modern derivations of "Knight's Bridge," including the battles, duels, and captures of highwaymen invented to account for it, in favour of the probable Neyte-bridge which there crossed the brook. To the Neate Manor House the abbots retired for country air in the intervals of business, and there the great Nicholas Litlington breathed his last, the first of a long list of eminent men whose names are connected with a district which we know best as Chelsea. The same house, or others on its site, was tenanted successively by Sir Reginald Bray, the architect of St. George's Chapel at Windsor, and Sir Anthony Browne, one of the executors of Henry VIII. Queen Katharine Parr had it as part of her dowry, and it was afterwards granted for life to her sister-in-law by a double connexion, the widow of the Protector Somerset. She was a Stanhope, the daughter of a Bourchier, and a descendant of Thomas of Woodstock, the youngest of the sons of Edward III.; and it was in favour of her children, to the exclusion of the children of his first wife, that the Protector, in the first instance, limited the dukedom he may be said to have conferred upon himself. Thus it came to pass that, on the landing of the Prince of Orange, Sir Edward Seymour could speak of the Duke as "of his family," when the Prince asked if he belonged to the Duke's. The manor was in the hands of the Crown in the reign of Charles I., and was granted by him to that Duke of Hamilton, or Duke Hamilton, as his contemporaries usually call him, who, shortly after the death of Charles, was beheaded on the same spot, in Old Palace Yard, where the blood of Raleigh had been shed thirty years before. Chelsea remained in his family till Lord Newhaven bought it in 1657, and in the now classic ground of Cheyne Walk we recognize a memory of the new owner's family name. But the Cheynes did not keep it long, and Sir Hans Sloane was the next possessor. His co-heiress married a brother of the famous General Cadogan, the companion of Marlborough, himself a colonel of Horse Guards, and the manor is vested in his descendants still. The name of Neate has perished, but Sloane Street and Cadogan Place help to commemorate the names of the successive lords of the manor, and Earl Cadogan's eldest son usually bears the courtesy title of Viscount Chelsea.

Of their estates in the west, Paddington and Westbourne remained to the abbots until the Dissolution, and both are still in a sense ecclesiastical property. Westbourne forms perhaps the most important portion of the temporalities of the abbots' successors, the Dean and Chapter of Westminster, and it is to a tenant under them that we owe the handsome "boulevard" of Westbourne Terrace. Paddington, too, although it is now separated from the Abbey, was not suddenly wrenched away; for it was at first part of the endowment of the short-lived diocese of Westminster, and was next appropriated to the bishopric of London—a circumstance marked in Bishop's Road, Blomfield Street, Howley Place, and various other names derived from the occupants of the see. The revenues were somewhat differently employed six hundred years ago; for Abbot Walter assigned them to provide for the expenses of his anniversary, when, as we are told, the almoner was enjoined to purchase, in addition to various kinds of beer and wine, a dessert for the monks and their guests, to consist of manchets, cakes, crumpets, cracknels, and wafers.

THE EUPION GAS COMPANY.

THE most remarkable and significant feature of the curious trial in regard to the getting-up of the Eupion Gas Company, which has just resulted in the conviction of four of the defendants on one of the charges of fraudulent conspiracy, is the line of argument which was adopted by the counsel for the defence. The charges of the prosecution were that the defendants had engaged in a conspiracy to cheat, defraud, and deceive various persons by starting a Company by means of pretended allotments of shares and pretended payments on them; that they had thereby imposed upon the Stock Exchange, and obtained an official certificate under false pretences; and that they had further got up a fraudulent traffic in fictitious shares in order to defraud the brokers. In meeting this indictment, Mr. Pope, who appeared for Mr. Aspinall and led the defence, frankly admitted that "some ugly matters had been unearthed and exposed, and, if fraud was to be presumed or assumed, many of the circumstances would seem to point to such a conclusion." He then explained that he was not there to discuss a question of morality, but merely a question of legal criminality; and that, in dealing with this question, he must necessarily appear to speak in terms of tolerance of some acts and transactions which he could not but reprobate. He admitted that, when an act was in itself criminal, its being usual was immaterial; but he contended that, when immorality was to be inferred from facts, the fact that the transactions were usual was very material. "The robust plant of commercial morality"—we fancy this must have been a slip for the weak plant of commercial morality—"did not thrive in an atmosphere of unhealthy speculation; and, no doubt, if Diogenes were in search of honest men on the Stock Exchange, he might be able to find them, but many a man's eyes there would blink in the light of his lantern." The question, therefore, he said, was "not whether on a balance of evidence there had been fraud," but whether it was a sort of fraud which went beyond the ordinary practices of the Stock Exchange. The other counsel in the case all praised Mr. Pope's speech, and adopted the theory on which it was based; and it is necessary therefore to observe what was the position thus taken up. The meaning would seem to be that, as there is one kind of flesh of fishes and another of beasts, so there are various kinds of honesty and morality. There is the natural morality of ordinary men, and there is the artificial morality of the Stock Exchange. Tried by the ordinary standards of morality, it could not be denied that the defendants had sadly broken down; but then it was pleaded on their behalf that they were overpowered by the noxious atmosphere in which they found themselves, and that it could not be expected that people who had anything to do with speculations on the Stock Exchange should be as honest and respectable as other people. According to this theory, there is to be one rule of honesty for transactions on the Stock Exchange, and another for the ordinary business of the world; and it must be admitted that the Stock Exchange itself has spared no pains to encourage this idea. In the present instance it was the brokers who were victimized, and of course the profession was exceedingly indignant at such an outrage. If, however, it had been only the outside public who had suffered, the Committee of the Stock Exchange would no doubt have taken care to keep their eyes shut. It was clearly demonstrated by the evidence taken before last year's Committee on Foreign Loans that the one great object of the members of the Stock Exchange is to bring in business from which its members may derive a commission; and that, though they would no doubt prefer honest business, if there were only enough of it, they are quite ready to wink at dubious and fraudulent transactions as long as they are not too openly scandalous. The interests of the body depend on the amount of business which goes through its hands, and it takes very good care to avoid making any inquiry or enforcing any standard of honesty which would limit the range of its customers. The professional respectability of the brokers is virtually offered for hire as a cover under which rogues of discretion, who know how to keep within moderate bounds and to avoid compromising their friends too seriously, can have ample opportunity for every kind of fraud which does not present itself in too flagrantly naked a form. It may be thought, therefore, that the plea of the defence in this case, that two blacks make a white, would not be without some force if it were a question only between the brokers and such people as those connected with the Eupion Company. It is necessary to remember, however, that there is another side of the subject in which the public has an interest. It is obviously dangerous that any special area of trade should be marked off in which an exceptionally low standard of morality is to be recognized as a genuine currency. Nor is there any reason why on the Stock Exchange speculators should not be bound by the same rules of honour and honesty as other people. One of the jurors, whose simple mind seems to have been much impressed by the ingenious pleadings in favour of free competition in roguery, asked whether the defendants would be guilty if they thought there was no harm in what they did; but the Chief Justice very justly remarked that too much stress must not be laid on the view that the commonness of an offence makes it lawful.

Although there was a difficulty in determining the precise degree of personal responsibility attaching to the defendants in this case, the general character of the operations in which they were engaged is plain enough. The prospectus of the Company stated that the Company was to work patents for making gas, that the capital was to be 50,000*l.* in 1*l.* shares (half to be paid on application and half on allotment), and that 40,000*l.* was to be paid to the patentees, 25,000*l.* in cash and 15,000*l.* in shares fully paid up; and it was represented to the Stock Exchange that all the capital was fully paid up, and on this assurance a quotation was granted. Now how far do these statements correspond with the facts? The Solicitor-General, we think, went too far in declaring that the gas business which the Company was to work was a mere sham. It existed, indeed, only in an experimental form, and it is doubtful whether the gas could have been produced at a price which would have been remunerative. Moreover, it would appear that some of the patents of which a parade was made were either extinct or on the point of becoming

so, and that the remaining patent had to be surrendered on account of the want of money to pay for it. Still there was an idea at the bottom of the scheme, and it had probably as much reality and substance as many other schemes which are brought out. If capital could have been found for carrying it on, it might have been got into at least a marketable shape; and if it had eventually collapsed, it could only have been said that the projectors were too sanguine. The rotten part of the scheme was the counterfeit capital. There was, in fact, no real capital at all. No shares were allotted to the persons who applied for them, nor were any payments made either by these persons or by those to whom the allotments were supposed to be transferred. It is quite clear that the applicants gave the use of their names merely to oblige the promoters, and that it was distinctly arranged that they should pay nothing, and should incur no responsibility. Indeed, at the same time that they signed their applications they also signed blank transfers which were given to the Company; and it afterwards turned out that, of the whole shares dealt in, all except 3 were found to be in the possession, or under the control, of Mr. Aspinall. It is true that a certain appearance of payment for shares was made by the Company, but this was altogether delusive. It is, we believe, a familiar expedient in theatrical management to make the supernumeraries who figure in a procession run round behind the scenes, and again march across in front, so as to give an imposing idea of their numbers. The promoters of the Eupion Company resorted to a similar trick. They obtained a loan of 3,000*l.* from the Midland Bank, which was soon afterwards returned to it. In the meantime, however, this sum had been made to do duty by being passed repeatedly through the London and Provincial Bank under the name of payments on shares to the amount of 17,180*l.* As soon as the money was paid in it was drawn out, and then paid in again, and this process was repeated until the entries made up the required amount of subscriptions. The loan was sent back to the Midland Bank, and the Company was left without a sixpence. It is quite clear that this was a purely fictitious and delusive transaction, since only 3,000*l.*, and not 17,180*l.*, really passed through the bank, and that this 3,000*l.* did not really belong to the Company; and it follows therefore that the declaration made to the Stock Exchange Committee that the capital had been fully paid up was, as the Chief Justice remarked, "a completely false document." When it is said that so many shares have been paid up, it must surely mean that the money so paid exists as an asset of the Company, and available for any calls which may be made on it. But in this case there was absolutely no money at all except the borrowed money; and a loan from a bank is of course something very different from a deposit by investors. It is true that the money for preliminary subscriptions is often provided by a syndicate, the members of which trust to repay themselves out of future profits; but in that case the shares taken up have to be paid for, though, it may be, at a reduced price; and consequently the Company has a certain amount of capital at its back. In the case of the Eupion Gas Company, however, the capital was altogether mythical; and the statement that the shares represented so much cash in hand was therefore a fraud. On this point the evidence was so clear that the jury had no difficulty in making up their minds, and they therefore found Aspinall, Whyte, Muir, and Charles Knocker guilty of conspiracy to deceive the Stock Exchange by false and fraudulent means. The Chief Justice, however, has reserved the question whether this part of the indictment is maintainable at law. This question will in due time be decided by a competent authority, and it is unnecessary for us to offer an opinion. But there can be no harm in saying that, if this sort of roguery is not at present within the reach of the criminal law, it is high time that it should be made so.

As to what has been called the "second part of the drama"—that is, the manœuvres by which the brokers are said to have been inveigled—it must be admitted that it is surrounded with a cloud of mystery which it is difficult to penetrate. There seems, however, to be no doubt that, while Aspinall, who had got all the shares, or, we should perhaps say, all the pretended allotments, under his own control, and who knew perfectly well that there were none, and could be none, in the market, used his influence to get various persons to buy shares, Muir, who had no shares whatever, was similarly instigating orders for the sale of them. This was represented by the counsel for the defence as only the ordinary bulling and bearing of the market, except that the mistake was made of putting on the screw too tightly. There was no direct evidence to show that Muir and Aspinall were playing into each other's hands; but when people sell what they have not got and buy what they know is not to be had, they can hardly be supposed to be acting honestly; and of course, if the object was to get up a delusive traffic in shares, the wires would have to be pulled on each side. The critical point of the case was, as the Chief Justice remarked, whether the transactions were real or sham; and the jury felt bound to give the defendants the benefit of any doubt. There is certainly nothing very new in the revelations which have come out in this case, but it is another melancholy and impressive proof of the facilities for fraudulent transactions which the Stock Exchange systematically offers, and of the general corruption which is fostered by its lax morality. In this instance the Stock Exchange people were caught in their own trap; but that is only one of the risks of keeping bad company.

VILLAGE MUSEUMS.

It is always refreshing to take up White's *Selborne*, to enjoy through his eyes the "innocent brightness of a new-born day," to let him discourse to us about the pansy at our feet, and teach us to sympathize with each common sight. Three generations have now delighted in his pleasant gossip, yet the book is as fresh as ever. One edition after another replaces the well-thumbed copies in country libraries; only this year, in fact, a really beautiful illustrated one has been brought out. It can never become obsolete any more than Pepys's *Diary*. Gilbert White in his country retirement, and Samuel Pepys immersed in all the bustle of London business and frivolity, alike kept a diary; and although the one may chronicle the doings of a Court, and the other the variations of the weather, each book is valuable for the same quality. Both these men were keen observers of what was going on around them, both tell us with simple accuracy of what they saw. The courtier collected materials which have become history, the parson made observations which have materially assisted the study of natural history. White's *Selborne* is valuable, partly because it is not written to support any theories, and there is no attempt to twist facts so as to make them dovetail into some pet hypothesis. No doubt a few assumptions made by the author have not been borne out when further light was thrown on the subject, but he never fell into the same sort of mistakes as Audubon. His vanity never carried him away, and there is no straining after fine writing. The most apparently trivial circumstances are introduced in so charmingly simple a manner that we cannot wish the least of them omitted. Why is it that nowadays we find so few observers of this simple but reflective sort? It would now certainly be impossible to find a man of education who, like Gilbert White, had never seen a modern map of Scotland, and who hoped when he did that he might find Lord Breadalbane's seat and "beautiful policy" recognized by the map-maker as "too curious and extraordinary to be omitted." But the higher education of to-day keeps the brain so busy that it has no time to use its eyes. Many a brilliant and cultivated man is full of astonishment when, as he sits on the bank of a quiet stream, ruralizing for a day's holiday, a scientific friend points out to him all the wonders that are to be seen within the space of a few square inches; dozens of different water plants, all with their distinct classes and habits; hundreds of living organisms dancing along the stream; mosses in endless variety clothing the banks, pebbles showing the geological formation of the district. He is delighted, and gets twice the pleasure out of everything from knowing a little of what it all means.

It is strange that, in country parishes at any rate, naturalists of the type of the Vicar of Selborne are not oftener met with. A clergyman's duties oblige him to spend so large a portion of his time in the open air that with a little trouble he can soon learn a great deal. When going his round of visits from hamlet to farm through the squire's park and along the quiet hedgerows, he has abundant opportunity for studying his furred and feathered parishioners, as well as those whom he has to supply with blankets and flannel petticoats. A knowledge of grasses and the soils suitable to them does not injure him in the opinion of the farmers, however bovine they may be. Old Betty will be much more likely to listen to his exhortations if he can tell her all about her favourite herbs and where they grow. She makes wonderful decoctions, to the wrath of the dispensary doctor and the delight of her patients, who invariably form their opinion of the merits of a medicine in proportion to the vileness of its taste. Her respect for the parson becomes worship if he will partake of some of her simples and say they have done him good. Then, too, the choir would not sing worse because they were taught to distinguish the different keys in which owls hoot, or to observe how painfully discordant it is to hear two cuckoos discoursing, one in D and the other in D sharp, while perhaps a rival suitor proposes from a neighbouring wood in C natural. Above all, by interesting the children of the parish in the marvellous mechanism of all living organizations, he might do much to check that cruelty to animals which arises more from ignorance and thoughtlessness than from an actual desire to inflict pain. A child could scarcely wish to kill a fly after having seen its feet magnified, or to put out the eyes of a bird when it understood the beauty of their formation. The parson can often, like Waterton, clear the character of some of the animals which are destroyed unconvicted of the crimes of which ignorance accuses them. He may show that nature can so beautifully balance things that she may sometimes be left to select for herself what is to live and what to die, that to destroy little birds is to encourage the ravages of insects, that crows amply pay for all the corn they eat, and that barn-door owls do not suck pigeons' eggs, but help the cats to protect the stack-yard from the attacks of field-mice. There is scarcely anything which arouses a more healthy curiosity in children, or cultivates their intelligence in a better way, than teaching them to examine into the out-of-door things which they generally pass without notice. A late famous naturalist, on going to a new parish, found the school in a deplorable state. The pupils seemed so dull and stolid that it was impossible to teach them anything. He made all sorts of plans for their improvement, but the bright idea struck him one day that he would take them out botanizing on their Saturday half-holidays. The results of the experiment were miraculous, and from learning to take an interest in the number of petals appertain-

ing to each flower, they soon began to understand their multiplication table, and reading came of itself after they had been taught to use their eyes. Pious people would no doubt be shocked if their pastor neglected Balaam's ass or Elisha's bears, and told the children of the Sunday School something about the robin redbreast that hopped round the door. The destruction of the Philistines' corn by Samson may be more improving, but the little ones, we fear, would prefer to hear how the oak grows from the acorn, or what gives its colour to the violet. It is sad to think that an acquaintance with the anatomy of a pigeon's wing is not religious knowledge, although sound views about the plagues of Egypt are essential to orthodoxy.

There are few things which would be found more civilizing and attractive to the young men of a country parish than a local museum. It is surprising how easily it can be formed, and in how short a time it becomes, if well managed, a source of pride to the villagers. It may, of course, contain any antiquities that have been found in the neighbourhood, or the carvings which have been removed from the church during its restoration, or any brasses for which room could not be discovered except in the vicarage lumber-room. The principal things, however, to bring together are those objects which belong to every-day life. The school children might by degrees form a complete collection of the wild flowers, ferns, and grasses. Some good-natured young lady would paint for them pictures of any remarkable fungi they found, and it is easy to get for a very small sum drawings of all common birds with which to compare any specimens brought for inspection. Some of the boys will probably have already made a fair collection of birds' eggs, which they can present; and during haytime and harvest curious nests will be found in the standing grass and corn, which can be preserved instead of being destroyed. The village mason may contribute fossils, and even the poor old man who breaks stones on the road will become almost animated when he thinks he has found an ammonite worth presenting to "our museum." The collection, whatever it is, must belong as much to the smallest ragged urchin in the parish as to the largest contributor, and in this way it would be truly prized and kept up. A village genius is pretty sure to arise who, with the assistance of Waterton's complete and minute directions, will soon acquire sufficient dexterity to stuff birds better than many a professional. An old gamekeeper learns to preserve the fish of the locality, and is able to give much curious and interesting information about the different flies which frequent different pools, and record the observations of many hours spent in waiting for a bite. There should be specimens shown of every sort of seed sown in the parish, and records kept of the biggest turnip, the longest carrot, the heaviest potato, the monster gooseberry, the most prolific ear of wheat. Everything, however commonplace it may seem to outsiders, is interesting to the little community who know each other; and much knowledge upon farming, gardening, and poultry-keeping will be acquired. There should be a large map of the parish hung up in the museum, and on it every change should be marked, as when two fields are thrown into one, when the mill-race is altered, a new house built, or an old one pulled down, a field drained, or the course of a river turned. A record should be kept of the large trees taken down, their age, the state of their timber, how much wood or bark was sold. When a new plantation is made it should be chronicled, and what sort of trees it is composed of mentioned, so that information may be gathered as to what plants thrive under certain conditions. It would soon become a source of pride to see how many different species of forest-trees could be cultivated successfully, and a new beauty would be added to the landscape.

A loan collection must not be omitted, for that is often the most interesting part of such an institution. It is astonishing how many queer things come to light when such an exhibition is started. There is some rare old book which proves to be almost unique. A choice bit of Bristol china belongs to one of the poor women in the almshouse, who has seen better days. The carpenter has bought a piece of finely-carved old oak for a few pence at an auction. One of the farmers finds in the hay-loft a pair of fire-dogs which are of a design so beautiful that they are sent to Birmingham to be copied for the squire's new fireplace. A beautiful processional cross turns up in the budget of a tinker, who sells it for sixpence. Quaint old samplers will be lent from the walls of farmhouse parlours, and perhaps the brocaded wedding-gown of a long-mouldering ancestor. The soldier home on furlough, the sailor returned from the North Pole, is sure to have something to show; and the successful gold-digger, or the young fellow who tried his luck in the diamond-fields, may contribute his quota towards the miscellaneous display of curiosities. There should also be a corner kept for specimens of the industries of the parish, whether lace-making, straw-plaiting, or embroidery. The best-knitted pair of stockings; the prize work from the girls' school; the piece of carving done in winter evenings by one of the boys; the hammered hinge which the blacksmith made after his own design—all these are sure to bring visitors who will be interested in them; and in later days young men will be found to date the time when they began to take a pride in their work from the day they contributed something to the village museum.

THE GÖRRES CENTENARY.

IN many cities of Germany the Ultramontanes have just been celebrating the hundredth anniversary of the birthday of Joseph Görres. Certainly they have taken no other prize in this century so remarkable as this "second Leibnitz" (second indeed in quality as well as in time), who was so amazingly catholic in the primary sense of that word before he became a Catholic in the technical sense. Many hundreds of Englishmen have stayed, without knowing it, in the house in which Görres was born, on the Feast of the Conversion of St. Paul, in the year 1776. It is that famous hotel on the Rhine opposite the Coblenz steamboat-pier, the huge white edifice upon whose front one reads the inscription in three languages —"Gasthof zum Riesen," "Giant Hotel," "Hôtel du Géant." His father was a Coblenz merchant. Joseph was the third of seven children; none of the rest became distinguished. A certain fitness may be fancifully traced in the day of his birth, for his life, like St. Paul's, was remarkable for its "wonderful conversion" from extreme to extreme, and for the impassioned activity with which he laboured to build up what he had once laboured to destroy. When his Gymnasium course at Coblenz was finished, he was prevented from going to any university by the political troubles of the time. He showed while at school the signs of that thirst for universal knowledge, and that longing to take part in practical affairs, which characterized him throughout life; he tried to learn everything, but he was not content with the pedantic and theorizing courses of logic, physics, anatomy, botany, or other sciences along which his teachers would guide him. The German choice between knowledge and deed, says Theodore Mundt, was never present in him; he would not rest until he had turned theory into fact. He drew his own maps; he made his own experiments in chemistry; he botanized; he even dissected. He scoffed at the fashions of his teachers; he questioned every authority in the school or the State which was merely hereditary and conventional. Such a young man in such a period was certain to be fascinated by the wonderful movement of the age. He saw in the French Revolution the gospel for Germany and for all nations. France was the Holy Land; Paris was the New Jerusalem, the centre of light and justice for all peoples; the Rhine was the Jordan; the Rhineland a Philistia or an Edom. The French soldiery were welcomed into the Rhineland by the young Görres and his fellow-believers as the armed apostles of eternal right; trees of liberty were planted in Coblenz; revolutionary clubs were set up in the old Electorate of Trier upon the Parisian model; an altar to the Goddess of Reason was even erected in the Schloss-Capelle, though indeed Gorres himself is said to have taken no part in that senseless worship. He was, however, in 1794, at the age of eighteen, the leading orator in the clubs, and he founded a revolutionary newspaper under the significant title *Das Rothe Blatt*, "the Red Journal," in which he attacked the German nobles, clergy, and officials with fierce iconoclastic passion. Even the French authorities felt bound to suppress it; but Görres reissued it under the title of *Rübezahl im blauen Gewande*. When he protested against the exactions of the French rulers in the name of liberty and equality, he was thrown for a time into prison. He dreamed that a kind of Platonic Universal Republic could be set up. His first work, *The Universal Peace*, was the literary result of his dream. In 1799 he put himself at the head of a deputation of his fellow-citizens and visited Paris, in order to persuade the First Consul to allow the Rhine provinces lost by Germany to be treated as allies of France, and to be incorporated into the Republic, instead of being occupied as a conquered country. His first great "conversion," which the Ultramontanes have just been celebrating, probably began with his first actual sight of Holy Paris, just as Luther's began in a measure with his first sight of Holy Rome. He passed through one of those painful processes of disillusion which are so often conversions in the germ. "Paris," he said, "is a mud swamp covered over with flowers." What he saw of Napoleon was the cause of his uttering to his fellow-citizens the truly prophetic saying, "Begin to study Suetonius; the new Augustus is ready." He published his experiences in a pamphlet, *Results of My Mission to Paris, Brumaire, Year VIII.* The first period of his life closed with this visit. He retreated in disgust from political life, and devoted himself to science. During this time of studious retreat he poured out a series of works which at least indicate the encyclopædic ambition of the man. In 1802 he published his *Aphorisms on Art;* in 1803 his *Aphorisms on Organonomy.* Full of zeal for the natural sciences, he issued, in 1805, his *Exposition of Physiology* and *Aphorisms on Organology.* In 1806 a new change of standpoint was manifest—he published his *Faith and Science.* His main friends were at this time the Romanticists, especially Clemens Brentano, his fellow-townsman. He now looked back rather than forward; the middle ages began to receive that glow and glory which had once hung over the year One of the Revolution, or over the unarrived age of the Universal Peace. The intensely mediæval *Einsiedler-Zeitung* was the work of Görres, Brentano, and Arnim. He was now greatly fascinated by the Old German literature; and, in 1807, with the purpose of awakening a genuine German feeling, he put forth his *German Folk-books*, and commended the Edda, the Nibelungen, and the legends of the St. Graal to modern readers. He turned to the study of Persian literature, and issued his *History of the Myths of the Asiatic World.*

But the energetic and practical mind of Görres could find no rest in that kind of work with which the typical German was,

until lately, supposed to be always satisfied. He burned for action. Knowledge was of no good, in his view, until it was producing its right effects upon society. A second time he became a journalist: but he wrote now for the German nation, not for the Universal Republic. His *Rhenish Mercury*, started in 1814, had quickly an amazing success. German readers had never seen such articles in a newspaper. They were aptly compared to the roarings of a lion who wakes up his young ones to the combat. Napoleon called it "la cinquième puissance," the Fifth Power confederated against himself. The house of its editor in Coblenz became a kind of pilgrimage-place for all the great statesmen and warriors who were eager for the deliverance of Germany [illegible] on the French for. Stein, Gneisenau, Blucher, Scharnhorst, [illegible] soon were gathered around this mighty penman, this German [illegible] the Germans. He served the German language as faithfully [illegible] he served the cause of German liberation: his style had [illegible] boldness and flexibility rare indeed among his fellow-countrymen. Lindemann calls it "a mountain-brook," it was so pure and strong. As soon as his articles appeared they were rendered into English and French, and were read throughout Europe. When the great foe of Germany and of Görres was finally defeated, and the long-deferred reign of hope seemed to be near, Görres was [illegible] and [illegible] that Prussian reaction, and turned his fiery pen [illegible] all scorn upon the absolutism of Berlin and the Congress. View His *Mercury*, which had become such a [illegible] was suppressed: he was deprived of his office [illegible] tor of Educational Institutes, and fined 1,200 guilders. [illegible] less to give a hint [illegible] would [illegible] ed Ger gave vent to his deep [illegible] ressed [illegible] Kings and princes [illegible] as little [illegible] he trust His second "conversion" was [illegible] vault. H all persons, as they can [illegible] ble deliver the nations. King Ludwig I. Bavaria ship in the new University Munich. found [illegible] real rest: the most restless of G [illegible] a sec the most practical, sharing by exception [illegible] study the mystics. His *Christ der Mystik* disturbances between the Archbishop of C [illegible] King Prussia in the next year brought the old lion again [illegible] upon his fee His famous *Athanasius* was almost his last work [illegible] his reply to L and Marheineke, in his *Pilgrimage to Trier*, was said to be the very last. There is something sad in the [illegible] tion with began with such boundless hope in the future [illegible] Mainz has work with the defence of the promoters of the adoration of the "Holy Coat of Jesus," under the plea of defending the faith against Rationalism. His singularly prophetic faculty was not quite extinct; it kindled again as he lay sick in the year 1847; he foresaw what a few months must bring, and declared with [illegible] that the Revolution was even at the door. He died on the [illegible] of January, 1848.

The fame of Görres in Europe was so widespread that a letter from America, addressed simply "Professor Görres, Europa," found its way at once to him. Was this singular man pre-eminently a statesman, a poet, a theologian, an historian, a man of science, or a journalist? No one can say that he was either distinctively and exclusively; he was all in one; he was indeed, as Lindemann calls him, a *Socialer-Mensch*, a man of the age, in whom all the elements of his own epoch were present, and were struggling. Whether so defiant and freethinking a genius could have felt long at ease in the new chains forged by the Vatican Council is a question which we cannot answer; it seems to us that the materials for two contradictory answers may readily be found in the study of his strange life and his writings. Indeed the German newspapers have been producing some telling extracts from the latter, which can scarcely be read by his Ultramontane admirers without a wince. It was not faith, but despair, which led him to Rome. He travelled thither by that pathway which has led so many astray—passionate irritation at the political present. After all, impossible as it may now seem, Görres was a German first and an Ultramontane afterwards. He fled to the Pope for the sake of the nation. He wanted a strong national Germany, one and indivisible. It was a strange irony that he should set his hope upon that Power whose main misery it now is that Germany is as strong and united as Görres longed to see it. In becoming an Ultramontane, he really went back to another form of that ideological Universalism which he had already rejected in its form of Republican pantisocracy; but he did not see that it was equally impossible under its Roman as under its French form, because it can only secure its end by the destruction of the noblest elements of a solid unity—the freedom and self-development of each nation.

CROSSED CHEQUES.

THE controversy on crossed cheques will certainly be interminable unless the disputants can agree to use words in the same sense. Mr. Hubbard said in his recent speech in the House of Commons that, as regards such cheques, "negotiability is a perfect figment." But the law says that a cheque is a bill of exchange, and a bill of exchange is a negotiable instrument—that is, an instrument the right of action upon which was by exception from the rule of the common law freely assignable from one person to another. Negotiability, says Mr. Hubbard, involves the existence of a market, and in the case of bills of exchange there is a market, and the price to be given for them becomes matter of negotiation. But there are vast numbers of bills of exchange which never are negotiated in this sense, and the legal sense of the word is that which it bears in the statute which imposes a stamp duty on bills drawn out of the United Kingdom and "paid, indorsed, transferred, or otherwise negotiated" within the United Kingdom. Mr. Hubbard says further that cheques are not negotiable in the same sense as bank-notes, by which he appears to mean that they are not negotiable to the same extent or with the same freedom, and this of course is true; but still they are negotiable in the same legal sense. A bank-note is a promissory note payable to bearer on demand, and a cheque is a bill of exchange payable to bearer or order on demand. Mr. Hubbard should remember that all mankind do not keep accounts with bankers, and among those who do not some may happen to have cheques sent to them. One expedient adopted by such persons is to get their grocer or butcher to cash a cheque, and this is negotiating the instrument. This may be done whether the cheque be payable to order or to bearer, and whether it be uncrossed or crossed generally, that is with the words "& Co." or transverse lines. Or it be crossed specially, that is with a particular banker's name, the only thing to be done is to find somebody who keeps an account with that bank and get him to cash the cheque. Mr. Hubbard [illegible] up and not [illegible] honestly done, but the law says it can. The assumption made in the case of Smith v. the Union Bank of London, that "C." was a *bonâ fide* holder of the cheque, and he relies on a statement made to him by plaintiff's solicitor, that neither he nor his counsel admitted the *bona fides* ownership of "C." But has turns out to mean only that we contended that a man who took [illegible] rally received cheque could be a *bona fide* holder, whereas [illegible] law says he can. The fact of the case states that the cheque was crossed for full value to "C." and the Court assumed on the argument that he took it *bona fide*. Mr. Justice Blackburn says that must be assumed from his having given full value for it, "unless the crossing prevents him from taking it *bona fide*," and to hold that would be to restrain the negotiability of cheques. Mr. Hubbard represents that learned judge as speaking [illegible] to the expediency" of restraining the negotiability of the instrument, but this is a mistake. Judges have more than once said that a cheque is a negotiable instrument, and it cannot be both this and non-negotiable at the same time. The existing Act provides that the banker on whom a specially crossed cheque is drawn shall not pay [illegible] any other than the holder with [illegible] ance [illegible] shall be to pay [illegible] The Union [illegible] paid crossed cheq [illegible] who name it was [illegible] ; but, after the war that [illegible] ade neither they nor her bank will [illegible] mit similar mistake. However, Mr. Hubbard wishes to [illegible] the statute in some way more stringent, and he might, if he thought fit, provide that should not bar a payment made in breach of the statute against his customer. Probably this is what he does mean to provide; but, however that may be, he will not by this means alone prevent that happening again which happened in Smith's case, except that he will compel "C." to present the cheque for payment through the banker whose name is crossed upon it. Mr. Hubbard has overlooked the fact that the authors of the existing Act contemplated the negotiability of the cheque, as appears from their providing that any "lawful holder" might write a banker's name across it. But Mr. Hubbard further proposes something which in the report of his speech is hardly intelligible. His remedy is represented to be that "he who should steal, or whose confederate should steal, a crossed cheque, should not by that theft acquire title" in it; and this probably means that the thief should not only not acquire, but be unable to confer, title. The effect of this would be that crossed cheques would be separated from ordinary cheques and from bank-notes, and placed in a class by themselves; and this, if thought worth while, might probably be done. But Mr. Hubbard should remember that a cheque may be lost under strong suspicion of theft, but no possibility of proof.

In the case which has occasioned all this discussion a simple precaution might have been taken. Mills & Co. drew a cheque on the Union Bank of London payable to the order of Smith, who endorsed the cheque and crossed it with the name of his own bankers, and gave it to his clerk, from whom it was stolen. It would have been equally easy for Smith, instead of writing his banker's name on the face and his own name on the back of the cheque, to have written both names on the back, and the cheque would thus have been specially endorsed, and would have been comparatively safe. Mr. Hubbard contends that cheques either are not or ought not to be negotiable, and his view appears to be that they should be merely a means of payment, and should only be transferred to the extent necessary to facilitate that object. Mills & Co. wished to pay Smith a debt, and Smith wished to place the cheque which he received in payment from them to his own account at his banker's. This was the purpose for which the cheque was drawn and endorsed, and there seems no necessity to do more than was requisite to effect this purpose. But Smith first puts a general endorsement on the cheque by which he makes it payable to bearer, and then he crosses the cheque with his banker's name, and thereby restricts or qualifies that generality. Mr. Hubbard is at issue with the lawyers as to what is or ought to be the precise nature or extent of this restriction or qualification. But we may ask whether the question that he raises might not be avoided. Whatever clause he induces Parliament to pass, the Courts will have

to interpret it, and this they are hardly likely to do to Mr. Hubbard's satisfaction. His well-meant effort will probably make the law more complicated than it is already. The root of the mischief is, as has been often said, that an attempt has been made to do two inconsistent things at the same time. Under the old law, when cheques were free from stamp duty, they could only be drawn payable to bearer on demand, and the ground of their exemption from duty was that "they were powerful instruments for economizing the currency both metallic and paper." But in that simple form, if they were lost or stolen they might easily get into the hands of a person whom the law would call a *bonâ fide* holder for value, and he could enforce payment. To diminish the risk thus arising the practice grew up of crossing these cheques either specially or generally, the effect of which was said to be that it was notice to the drawee only to pay the cheque to some banker, or at least that he must be cautious in paying it to anybody else. But when the stamp duty of *1d.* on all cheques was imposed, it became legal, and was thought convenient, to draw cheques payable to order on demand. If a cheque be thus drawn by a debtor in favour of his creditor, it is a tolerably safe mode of remittance, because, if it be lost or stolen, the person into whose hands it comes can only make it available by forging the name of the payee. But, if that name be forged, and the drawee pays the cheque, he is protected from liability by statute: whereas, if the drawer's name were forged, he would not be protected. This enactment was founded on the principle that, although a banker may be expected to know the signatures of his own customers, he cannot be expected to distinguish at his peril between the genuine and forged signatures of all the world. Hitherto the banker had had only his customer's signature to deal with, whereas on the new form of cheques there would be at least two signatures. Further security was gained for the cheque payable to order by crossing it either specially or generally, because a thief or finder must not only forge the endorsement, but also induce a particular banker, or at least some banker, to present the cheque for payment. If, living in the country, you want to pay a bill in London, your safest course will be to draw a cheque payable to the order of your creditor, and to cross it with the name of your creditor's banker if you know it, or, if not, to cross it generally. Your creditor, on receiving the cheque, may, if he intends, as he probably would, to pay it to his account at his banker's, endorse it specially to them, and also convert the crossing of it, if general, into a special crossing with their names. The cheque would then be absolutely safe, and it is little more trouble to write a name twice than to write it once. But suppose for a moment that the cheque reached the creditor's hand uncrossed, as in Smith's case, and he, instead of crossing it, endorsed it specially to his banker, and sent it by his clerk to the bank, and it was lost or stolen on the road. Any person into whose hands it got must forge that banker's name, and, having done so, he must either himself present the cheque for payment, or find a friend rash enough to do so for him. The banker, of course, would know that he or his friend was not a banker's clerk, and he would also know or vehemently suspect that the endorsement was forged. It seems, therefore, that such a document would be quite safe against dishonesty, and it would exactly answer the purpose of paying a debt, and preserving a record of the payment, which Mr. Hubbard thinks desirable. But Smith introduced complication by doing that which he had a perfect right to do—namely, by endorsing the cheque generally, or, in other words, making the cheque payable to bearer. The combined effect of this and of the crossing as expounded in two courts of law affects Mr. Hubbard and others with surprise, dismay, and regret. The Attorney-General courteously assumes that the Bill which Mr. Hubbard, under the influence of these feelings, desires to introduce will be a beneficial measure, and until we have seen its clauses we shall not assume the contrary. But we would urge simplicity in any enactment that is to affect the general monetary dealings of the country, and we certainly do not think that the legislation on crossed cheques as it now stands is simple, but very much the contrary. If a special crossing is intended to have the effect of a special endorsement, it would save trouble to endorse specially.

OTHELLO AT THE LYCEUM.

THE production of *Othello* at the Lyceum is decidedly successful, although not exactly in the manner which seems to have been anticipated. The warmest admirers of Mr. Irving will probably confess that the largest share of the applause gained by this representation does not belong to his individual acting: but, as the play was produced in order that he might act in it, to him is due the credit of having brought about a satisfactory Shakspearian revival. The defects of his performance are the same as those which he exhibited in Macbeth, although they are more prominent in Othello. His awkward gait and unpleasant voice necessarily detract from the impressiveness of his first entrance; and when he speaks before the Senators, and the Duke says, "I think this tale would win my daughter too," we can only say that we do not think so. Genius, however, can overcome natural defects, and it is only just to say that in the last scene we almost forget Mr. Irving in Othello. His failure in other scenes is to be ascribed to vicious habit, which has been confirmed by success and popularity. An intelligent and educated man, if he could forget what he has done before, and what the public or the critics expect him to do again, would surely not suppose that the tones and gestures of an Ojibbeway were proper for Othello. At the close of the long scene in which he is roused to jealousy by Iago, his appearance and manner are those of a sham Indian about to perform his war dance in a booth at a country fair. It is a pity that this scene should be thus spoilt, because he is much helped in it by Iago, and he might have attained in a better way conspicuous success. He is not the valiant Othello whose occupation we all feel is gone, but we rather share the sentiment of the British sailor when he was told that the snivelling nigger in the picture was his brother. As was said in reference to Macbeth, Mr. Irving wants robustness in this part. It may be true that other actors have done the same things that he does; but all depends on the mode of doing them. He seizes Iago by the throat and drags him to the ground, and thus far all is well, and he is at least thoroughly within precedent, although we may doubt whether a little less pulling and hauling would not be more dignified. But next he throws himself full length on a couch with his face concealed and the soles of his shoes emphatically conspicuous. It is perhaps the fault of an ill-stored memory that at such a moment we can think only of the opening scene of *L'Oncle Sam*, where several pairs of boots appear to hold discourse, although on less exciting topics than marital jealousy. Again, when Mr. Irving says, "I'll tear her all to pieces," he probably feels called upon to emulate the traditional intensity of Kean, and accordingly his fingers not only perform with the perfection of a machine the comminuting process, but also appear as if they were distributing the fragments among the audience. It is instructive to observe the effect of this scene upon persons having the dress and speech of gentlemen who have never read through the play, nor heard a word about Kean's or Macready's acting. Such persons are not uncommon occupants of stalls, and if you listen to them you will perceive that they are not much impressed with Mr. Irving in this scene, while they applaud Mr. Forrester in Iago. All that clutching the throat, rumpling the hair, and twirling the fingers is wasted upon ignorant people who do not know that it is the approved method of expressing tragic passion on the stage. Mr. Irving, however, begins this scene well, and almost every word he speaks in the first part of it may be listened to with pleasure. He answers Iago at first carelessly, and then with a gradual awakening of suspicion. All this is very good on both hands, although even here Iago has rather the best of it. His delivery of the familiar lines, "Who steals my purse steals trash," &c., calls forth deserved applause, which is almost the only interruption of that silence which is, after all, the greatest compliment; and when he says, "Wear your eye thus—not jealous nor secure," &c., he avoids the common error of endeavouring to look as if he could see preternaturally far into a milestone. Happily there are no traditions of strong effects in the part of Iago, nor is there, as far as we are aware, any speech where it would be considered necessary, even on the Far-Eastern or transpontine stage, to draw too breath with a gasp or sob as seems to be thought proper in Othello. Mr. Irving has always shown an intelligent disregard for stage traditions; but unhappily he has created for himself, or critics have created for him, a standard of intensity which is almost equally pernicious. One is reminded of Mr. Carlyle's modern author saying to himself, "Come, let us make a description," when we see these elaborate efforts to get a tremendous effect out of a particular line. Suppose that an actor of good person and voice, well trained in stage business and thoroughly studied in his part, could forget the precise moment at which he ought to beat his breast, tear his hair, or wring his hands, and simply let feeling take its course, and voice and action follow it, he could not help moving his audience in this part more deeply than they are moved by Mr. Irving. In the speech beginning "Oh! now for ever farewell," &c., it is not only that he does not look as if he belonged to the calling which he is giving up, but the feeling which ought to underlie the words seems to be beyond his range. For the same reason, in the scene with Desdemona in the fourth act he excites little of the sympathy due to the beautiful lines he speaks; but of course he is, to use a vulgarism, "all there" when he wants to emphasize "foul toads" or "the gate of hell." In the last scene he succeeds better perhaps because he attempts less; and when he speaks the words "Nay, had she been true," &c., he seems to have found, although too late, the way to his hearers' hearts. Our strongest impression as the curtain falls is wonder that an actor of so much ability and diligence should have so far spoiled a magnificent opportunity.

This production of *Othello* is in various ways remarkable, though not for the success of Mr. Irving. The scenery, dresses, and other appurtenances of the play are excellent, and at the same time no pretence is made at substituting this kind of merit for good acting. Miss Bateman's Emilia deserves hearty commendation. Mr. Forrester's Iago gains the chief honour of the night; and here we find, almost with surprise, an actor capable of disregarding the absurd conventionalities of the part. Most of us remember how the words "Oh, you are well tuned now," &c., are usually spoken by an actor whose anxiety appears to be to concentrate in two lines the quintessence of the rascality of the world. This pronounced scoundrelism of Iago is as much a tradition of the stage as the violent passion of Othello; and it is too commonly forgotten that no gentleman, to say nothing of ladies, could have allowed himself to appear in company with such a miscreant. But Mr. Forrester has the look, carriage, and manner of a gentleman, and he makes it appear credible that Othello should

listen to his suggestions. Mr. Brooke is the best Cassio that has been lately seen. His drunken scene is excellent, and his penitence afterwards evokes applause which ought to console Sir Wilfrid Lawson for whatever fate may be in store for his Permissive Bill. "I will ask him for my place again: he shall tell me I am a drunkard. Had I as many months as Hydra such an answer would stop them all." There is more strength in these simple words than in any quantity of long-winded resolutions of the Alliance, and it may be doubted whether the argument for total abstinence has ever been put so forcibly as in Cassio's example. He feels that his only safety is not to drink at all, but he drinks a little, then loses self-command, and becomes a very Dr. Jekyll into which Iago pours liquor. No one can help sympathizing with Cassio's misfortune when the part is played as Mr. Brooke plays it, and the marvel is that Othello, whose misfortune is so much greater, is so played by Mr. Irving as hardly to take hold of the feeling of the house at all. Mr. Mead in Roderigo seemed at first rather too lively alive to the fact that he has only to appear in one act; but, after a little experience, he slightly mitigated this vehemence, and now performs the part quite satisfactorily. The manager is not open to the charge of selfishness, namely on Mr. Irving's behalf, and it is well that a genuine effort has been made to deserve the popularity which this theatre has attained. The choice made among Shakespeare's plays has not been judicious. Instead of Macbeth or Othello it might have been well for Mr. Irving to turn his attention to King John or Wolsey, and thus opportunity would be given to Miss Bateman to try the part of Constance or Queen Catharine. It must, however, be acknowledged by Mr. Irving that very few persons in a theatre know a play of Shakespeare even the principal scenes of it by rote, and the first requisite towards getting himself understood is to make himself distinctly audible. "But yet the pity of it, Iago," says Mr. Irving, and if the words were not so well known we should hardly guess what he is talking about. The character of Othello is comparatively simple, and it will be difficult to start any controversy as to Mr. Irving's conception of it, as might be done in reference to Macbeth or Hamlet. There may perhaps be persons ready not only of admiring his new part, but of giving a reason for their admiration, but we doubt whether they will carry the public along with them. Although, on the whole, we did not like his Macbeth, yet there were many passages which he so delivered as to be well worth listening to. But really as regards elocution he does not seem to gain back more than time. Except in the last scene, his delivery of his speech that we could wish to hear again, and even in the first speech of all there is an outbreak of the old propensity to over-action. When Othello took the actual Turk by the throat he was probably very angry and showed it. But whether Othello, when he recalls this incident, should accompany it with comparable anger against an imaginary Turk is, we think, doubtful. He has said just before that his eyes drop tears, and many actors, even those who are not reputed heads of the profession, have dashed tears on such occasions. Mr. Irving, we believe, neither does nor could, and unless he can himself feel, he is unlikely to excite feeling. It is perhaps accidental that he does not quite calculate his distance before falling, and so has to drag himself awkwardly along the ground to reach Desdemona. In other respects the last act is well managed, and we are glad to find that the lady remains quietly in bed, instead of running about the stage as the manner is when Signor Salvini operates. But we must say again that it is astonishing how bad the whole performance of Othello is. "The pity of it" is just that which we nowhere feel.

REVIEWS.

THIELMANN'S JOURNEY IN THE CAUCASUS.*

WE are paying a sincere compliment to Baron von Thielmann when we say that his two volumes might have been written by an Englishman. There is nothing in any of the pedantry which is too often associated with the literary performances of an erudite and erratic Teuton. The style is lively, scholarly, and at times picturesque; the topics are diversified, and the views sound; the author has, *more Germanico*, carefully studied the works of previous travellers in the Caucasus and Persia; and there are no ponderous disquisitions on the arrow-headed character or the causes of the ancient populousness of Mesopotamia, to warn off men who really want to know what is worth seeing in parts of the dominions ruled by the Czar, the Sultan, and the Shah. The author is a man of education, experience, and position. He fought at Sedan, as we gather from one passage. He has held an important diplomatic appointment at St. Petersburg, and he is evidently a keen sportsman as well as a hardy traveller. We could perhaps wish that, in addition to some acquaintance with the Russian language, he had acquired a little mastery over Persian or Turkish, or both. But he knew nothing of the former, and very little of the latter, while he could just manage to muster a few Arabic phrases by the help of a pocket dictionary. But he has contrived to give us two very good volumes, in which there is no straining after effect, and, as far as we can discover, no exaggeration, and but few errors. We may say, on the whole, that Baron Thielmann has been fortunate in his translator, because the English version is neither stiff nor awkward. One test of a good translation is that we are deluded by it into thinking that we read not merely the author's own thoughts, but his very words. And, if tried by this criterion only, Mr. Heneage's production is a success. But Mr. Douglas Freshfield, than whom probably few men are more competent, has pointed out, in the columns of a weekly contemporary, several "serious blunders" into which the translator has fallen. In one or two instances the point of the original has been missed. In others it has been added to, metamorphosed, or misinterpreted altogether. But these deductions are not sufficient to spoil the enjoyment of the book. We shall ourselves hereafter indicate other instances in which the translator seems to us in fault, and where his version is calculated to mislead the reader, or, what is perhaps worse, to leave a vague impression on the mind. Neither are we sure that the particular topics selected for praise in the translator's preface are precisely those most likely to prove attractive to the general reader; but there is no want of variety and incident, while there is a great deal which, if not entirely new, is very well put together, and is calculated, in the Baron's own language, to guide a fellow-way any one who wishes to visit the least fair and distant lands." With great judgment, too, the author has compressed into a supplementary chapter some useful advice to the tourist as to his equipment for such a trip. We are told what hardships and inconveniences we have to meet; how we must dress, to defy the changes of the climate; what we ought to eat, drink, and avoid; what sort of luggage is best fitted for the rough hands of an *Hussuk*, or the inaccommodating hump of a camel; to what standard authors, whether of books or maps, we shall be most indebted; what the journey will cost; how we must higgle with shopkeepers in purchasing shawls and jewelry, and how preserved meats and rolls of German sausages can produce contentment even in the dirt and discomfort of a wretched *dukan* or *serai*.

We make out that the tour occupied about five months. It began at Odessa and ended at Beyrout. But in this space, and before he left the latter port on his return voyage, Baron Thielmann visited Poti, Tiflis, Kutais, Erivan, and other well-known places in the Caucasus. He then went across Daghestan, or the country of Shamyl, to Petrovsk, on the Caspian Sea. Thence it was an easy trip by steamer to Baku and Lenkoran, and so by land to Tabreez. We regret that he does not seem to have had time or inclination to extend his travels in Persia further east and south, in the direction of Teheran, Ispahan, and Shiraz. But, for some reason, he went to Mosul, and so down the Tigris to Bagdad. From this latter place he visited the ruins of Ctesiphon or Medain, then proceeded further south to Hillah and Babylon, and finally accomplished a laborious march right across the desert, nearly due west, to Palmyra, Damascus, and Beyrout. A man must be a genuine explorer as well as a skilled writer who, in the same space of time, could contrive to see so much and to describe so well what he had seen. Though we have lately noticed Mr. Grove's mountain tour in Caucasus, we have read Baron Thielmann's work with no sense of iteration or weariness. Mr. Grove looked at the country with the practised eye of a mountaineer. A sportsman and diplomatist like the present author naturally turned his attention more to towns and villages, dress and languages, social and political customs, than to Kazbek, Ararat, and Elburz. Perhaps the difference between two men, very intelligent in their several ways, may be best illustrated by the degree of attention which they have respectively bestowed on Tiflis, the capital of Georgia. Mr. Grove treats it briefly, with the remark that it was worth seeing, but not worth going to see. Baron Thielmann gives us a short history of its origin and changes; illustrates his narrative by an excellent photograph; divides the city into the Oriental and the Russian quarters; describes graphically the dresses, features, and bearing of the different tribes that frequent its bazaars, Armenians, Tartars, Lesghies, Russians, and Persians; and has a word for an ancient Grusinian church and a very modern museum. Some of the disclosures of life and manners in the Caucasus are irresistibly suggestive of our own British rule in India. A local functionary, who came from the Baltic originally, but now occupied a post paid with what the Baron evidently considers the munificent salary of 2,000 roubles a year, was exercising criminal and civil jurisdiction in a district on the river Rion, and, owing to distance and difficulty of communication, was practically above appeal. This official in one year decided 1,200 civil and 200 criminal cases. This disproportion between offences against life and property and squabbles as to whom property belonged leads us to conjecture, either that the distinction between civil and criminal trials is not very well defined, or that the population must be more addicted to litigation than to crimes of violence, or else that there may have been a misconception or error in the numbers. In similarly wild parts of India the excess of the one branch over the other would just have changed places. On more than one occasion the author and his companions had to put up at what he and the translator terms a "duchan." This is nothing else than the Persian word *dukan*, literally shop, and is very well explained by the comment that it is not exactly an inn, for it has no special accommodation, and hardly a shop, in that it only does a retail business in salt, meat, occasionally wine, and rarely bread. In fact, the head shopkeeper of the village finds it pay to take in "casuals" for the night, and in many provinces of India, natives and natives only, going from one province to another on leave, furlough, or business, are thankful for the shelter given by the *dukandar* or shopkeeper. Sudden attacks of fever or dysentery appear to be as common in the Caucasus as in an Indian province; and the latter yielded to a

* *Journey in the Caucasus, Persia, and Turkey in Asia.* By Lieutenant Baron Max von Thielmann. Translated by Charles Heneage, F.R.G.S. 2 vols. With Maps and Woodcuts. London: John Murray. 1875.

prescription which is very minutely and carefully described, and reads like an extract from the memoranda of an Indian M.D. For fever, on another occasion, accompanied with violent pains and faintness, the best remedy was immediate change of air. But these expedients seem better calculated to restore health than indigestion, which some one had recommended to the Baron in order that he might get rid of dysentery, unless we may conclude that this recommendation pointed the moral of getting out of a bad district as fast as possible. Scarcity of wood sounds oddly for a country abounding in jungle and vegetation, but in the Southern Caucasus the inhabitants collect manure, press it in the form of cakes, dry the cakes in the sun, and cook their meals with this fuel. The same process may be observed daily in hundreds and thousands of villages in India. Baron Thielmann devotes a considerable space to the rise, character, and actions of Shamyl, to whom he attributes all the good and bad qualities of an Oriental despot. We must leave readers to decide for themselves on the truthfulness of the author's picture of this independent chief, and on his treatment of the Russian family of Tchawtchiwadze, merely remarking that he must be a bold person who would brand a gentleman of this name, as well as that of a landed proprietor previously Tcholochy, with the Teutonic termination of which nothing particularly Caucasian seems to attach, as a robber and murderer. From Baku the author took the land route and here he begins to find pleasure in travelling. We are passing rapidly through a foreign country with its own customs, and his judgment as to the administration of [illegible] But there are no pretensions to write what is [illegible] spot mentioned the wreck of [illegible] [illegible] only to be at fault. The old bridges on one way built by [illegible] Abbass, but now broken down, or [illegible] beyond streams which they were intended to [illegible] the ruins of clay which, at a distance, could [illegible] from the soil itself, the sacred edifices consecrated to the worship of which the ancient seem to have had the most important [illegible], the temples of the [illegible] unpaid and old in the cast-off uniform of [illegible] for which the Persian chiefs pay [illegible] to, the foreign amount dwindling [illegible] expenditure would [illegible] only to the point to [illegible] the low standard of morality which governs the conduct of public functionaries of all grades—all this fully [illegible] the comments of the author and the sentiments to which we have more than once given expression in these pages. What the translation from the plague, or curse of the land, as we should have put it, is to Government, the curse of the Government is to the people, and the curse of the people is an unproductive soil. 'From this vicious circle there is no escape.' Baron Thielmann devotes ample justice to the picturesque life and animation of crowded bazaars, to the spasmodic exhibitions of vigour and ingenuity now and then displayed by local governors, handicraftsmen, and skilled artisans, to the richness and beauty of vegetable life shown in well-tilled fields and orchards heavy with luscious fruits, wherever a supply of water comes to the aid of the agriculturist; and to the ease and polish with which hospitality is dispensed by the Amir and the peasant. But he deservedly censures the want of knowledge of the real state of the country which so many European journalists showed when anticipating the regeneration of the Persian people by the Reuter Convention. The plan of taking a lease on farm of a whole country could have but one termination. If unsuccessful, it would have ruined its projectors, and if successful, which from the first was impossible, it must have ruined the Shah.

The descriptions of places which bring up whole vistas of ancient history before us will be read with pleasure. They are graphic, and not overlaid with borrowed erudition. We shall leave our readers to go with Baron Thielmann to the three ruined cities which represent ancient Nineveh in the neighbourhood of Mosul, to the stony heaps, which for miles line the bank of the Tigris above Bagdad, to the base of Babylon; and to the Tak-i-Kesra of the Sassanian kings at Ctesiphon. The author laments the loss of a drawing of this magnificent façade, which is but a fourth of the original building, and the impossibility of obtaining any photographs of it at Bagdad. An illustration of this edifice will be found, Mr Heneage tells us, in Fergusson's *Handbook of Architecture*, and we may state that a very good oil painting of it is now in the possession of Sir Henry Rawlinson. Some readers may perhaps look with most interest to the Baron's account of his journey across the desert from Hillah to Boyrout. The worst part of this trip took up thirteen days. The road lay by no means over a level tract of land. There was now and then a plateau which it took a day to cross. And this was varied by low hills, deep ravines, and the beds of torrents. The nights and mornings were bitterly cold, and though the party had to ride early to avoid the heat of the day, the tents after all were not pitched until 4 P.M. Game was plentiful, but shy, and the travellers lived on dates, bread baked weeks before and soup made up of the unfailing German sausage, with rice and potatoes, followed by a glass of Cape wine. We have said that the author is evidently a thorough sportsman. He never loses an opportunity of telling us what game he saw and what he might have killed had he thought it worth while to linger. In the east as he was present at one of the Grand Duke's battues, but was not lucky enough to get a shot. He saw, however, on other occasions, in the same country, pheasants, red-legged partridges, quails, hawks, and eagles, and he has a good deal about woodcocks and snipe. We could have wished that Mr Heneage had himself been a bit of a sportsman or naturalist, like his author, for we are fairly puzzled at some of his interpretations of sport. He makes the Baron say that he saw "desert hens in the wilderness." Doubtless the original German word is "Huhn" of some sort, and possibly "Wildhuhn." This could not, of course, be the prairie hen of Canada or North America, and "Wildhuhn" is, we find, the German for ptarmigan. Looking at the Baron's description of this desert bird as one of a sandy yellowish colour, we have little doubt that the sand grouse is meant, which, though very different in its habits, is of the ptarmigan or grouse kind. Wildfowl of all sorts, waders and divers were so abundant in the shallow lakes and swamps, that the noise of their wings was like distant thunder. Some four-footed beasts are as much as "desert hens." What are "red cynocephalus, with which the plains round Nineveh were swarming?" Are they gazelles or antelopes? They cannot surely be the *Sha'lan* of Scripture, the Arabic *Webi*, which is wrongly translated in the coney in our ordinary version. The *Ibabi* is, we believe, grey or brown on the back, and not red. Can the original word be *Ledhase*, or the Jerboa? This animal, however, lives in the sand, and is not the Shaphan of Scripture. Again, what sort of articles are "woollen buckles?" We must take the liberty of doubting, too, whether the author came upon what is called as a "deserted churchyard," in the valley of the Rewendiz, between Tabriz and Bagdad. We suspect that what the author saw was an old and abandoned Mahommedan burial-ground, the graves of "the faithful" may very easily be mistaken for those of Christians. What are we to understand was the business of a Parsee commissioned by the Russian Government to collect "law antiquities" amongst the different tribes? We apprehend that the authorities wished to know about the prevalence of quaint old customs in the different tribes of Caucasia, with the view of improving justice by giving formal sanction to particular ways of settling disputes. But it is quite impossible to be sure of these mummies, and it was the obvious duty of the translator to clear them up. The presence of a priest at Baku who was ignorant of Zend and Sanskrit seems to have surprised the Baron. But it would have been far more surprising if a fire-worshipper on the shores of the Caspian had known anything of the sacred language of Irania. And as for the language of the Zend-Avesta, modern Parsees are no more obliged to study it than ordinary Jews in the Ghetto are expected to know Hebrew. By the cry "Jallah" we take Ya Illah! (O God!) to be meant. But there is always a difficulty in dealing with a foreigner's account of Oriental ways, names, and places, and the German spelling is favourable to additional disguise and mystification. We do not make these remarks in order to disparage the book or to detract from its value. In spite of blemishes and uncertainties, it possesses solid merits, and we should have much regretted if such a record of intelligent adventure, excellently told, had remained hidden from most readers for want of a skilful interpreter.

PAUL'S LIFE OF GODWIN*

"THE name of Godwin has of late been too much forgotten. Most people, it is true, have heard of *Caleb Williams*, and perhaps remembered who was its author, but such a work as that which Mr Paul has well done was needed to bring to recollection the influence which Godwin had upon his times. 'Though the present generation,' says Mr Paul, "has read his works but little, this age owes more to him than it recognizes, many opinions now clothed in household words were first formulated by him, and the publication of his *Political Justice* in 1793 marked a distinct epoch in the growth of liberal thought. During a large part of his life younger men looked on him as a kind of prophet-seer, and he exercised a remarkable influence over all with whom he came in contact."

Godwin, the seventh child of thirteen, was born on March 3rd, 1756, at Wisbeach, where his father was a Dissenting minister. His early education had a strong Calvinistic tinge, and the chief characteristics of his mind "were rebellion and love of distinction." At eight years old he had resolved to be a minister, and used to preach sermons in the kitchen every Sunday. "One Sunday, as I walked in the garden, I happened to take the cat in my arms. My father saw me, and seriously reproved my levity, remarking that on the Lord's Day he was ashamed to observe me demeaning

* *William Godwin: his Friends and Contemporaries.* By C. Kegan Paul. London: Henry S. King & Co. 1876.

myself with such profaneness." At the age of eleven, having left a small school at Hilderson, he became the only pupil of one Samuel Newton, an Independent minister at Norwich, whose creed was that of Sandeman. He gives a curious and probably accurate portrait of himself at this time. He had an intense love of reading, a strong curiosity, with "a trembling sensibility, and an insatiable ambition. . . . The love of approbation and esteem, indeed, that pervaded my mind was a nice and delicate feeling, that found no gratification in coarse applause, and that proudly enveloped itself in the consciousness of its worth, when treated with injustice."

It is interesting to note the development of these qualities in Godwin's later life. That it was not strictly true that, then at least, he "found no gratification in coarse applause" is evident from the beginning of his intimacy with Mrs. Clairmont, who became his second wife. When Godwin was living at the Polygon in Somers Town in 1811, she occupied the next house, and their balconies were close together; one evening she addressed him with, "Is it possible that I behold the immortal Godwin?" Mr. Paul remarks upon this, "To swallow flattery, however coarsely served, was always one of his weaknesses." One of his peculiarities was that he had a passion, if we may employ a contradiction in terms, for suppressing every sign of emotion; and thus in his carefully-kept Commonplace Book at this time no stronger expression than the words "*Mrs. Clairmont*," which he underlined, are to be found with reference to her. The habit of outward coldness which is noted throughout his diaries suggests curious speculations as to his character. There are many men who appear most collected when they are most deeply moved; and this is chiefly the case with those who, like Godwin, have a great self-esteem, which leads them to mark their superiority by a refusal to betray, at least to appear, disturbed by the emotions which shake ordinary mankind. This induces us to doubt whether Godwin had in reality the calm temperament which in one passage his biographer assigns to him. The faculty of his mind which he noted at an early age for "proudly enveloping itself in the consciousness of its worth when treated with injustice" did him good service many times; but it was sometimes led to mistake reasonable censure for injustice; as on the occasion of his tragedy *Antonio* being damned in 1800. Some correspondence, very characteristic on both sides, passed between the author and Kemble before its production. Godwin's letters, from which extracts are given, were written at great length, and charged with ingenious eloquence to combat the objections to his play, while Kemble's answers were cool and business-like. The author was extremely timid about his name appearing, lest the personal prejudice concerning himself at that time should affect the fate of his play, and he seems to have thought of somewhat doubtful means for preventing this, as in one of Kemble's letters occur these words:—"I really don't know how to set about such an affair as sending word to any newspaper that Mr. Tobin is the Authour of Antonio while I know the contrary, but it will glide into a Paragraph, of course, as other undesigned mistakes do, after he has been seen at a Rehearsal or two, that you may be sure of." In spite of all precautions the play failed hopelessly, a circumstance which apparently affected Godwin far less than his devoted friend Marshal who went with him to see it.

This Marshal first appears in the period between 1785 and 1788, when Godwin had abandoned his profession as a Dissenting minister and had started as a literary man. He had already published some now-forgotten novels, upon which his mother, in writing to him, observed:—"Since I received yours am told you have commenced Novel writer, own it gives me some concern that you that are so capable of turning your thoughts to some thing that would have been for the good of mankind should take that turn." There is an undated letter of this time in answer to one from his mother, which contains an exposition of the belief for which he had exchanged his former creed:—

I am exceedingly sorry that you should suffer yourself to form so unfavourable an opinion of my sentiments and character as you express in your last letter. Not that I am anxious so far as relates to myself what opinion may be formed of me by any human being: I am answerable only to God and conscience. But I am sorry, even without deserving it, to occasion you with [*sic*] the smallest uneasiness.

* * * * * *

With respect to my religious sentiments I have the firmest assurance and tranquillity. I have faithfully endeavoured to improve the faculties and opportunities God has given me, and I am perfectly easy about the consequences. No man can be sure that he is not mistaken, but I am sure that if I am so, the best of beings will forgive my error. If I could ever hope for his approbation, I have now more reason to hope for it than ever. . . . The only object I pursue is to increase, so far as lies in my power, the quantity of their knowledge and goodness and happiness. And as I desire everything from God, I hope the situation in which I am now placed is that in which I am most likely to be useful. Always anxious to resemble the great Creator, can I be afraid of his displeasure? If he has resolved to punish in another world those who are most sincerely desirous to act properly and uprightly in this, what must we think of his goodness or his mercy?

It was at this period that he formed a friendship with Holcroft, who is now best known as the author of the *Road to Ruin*. All through life, as is often observed in men who have a fixed habit of introspection, he was disposed to take offence where there was none in his friends' dealings with him, and to exaggerate the most trifling inattentions into deliberate insults. Under some such impression he must have said or written to Holcroft what called forth this letter:—

Sir,—I write to inform you that instead of seeing you at dinner to-morrow I desire never to see you more, being determined never to have *any* further intercourse with you of *any* kind.

Feb. 21, 1785. T. Holcroft.

I shall behave as becomes an honest and honourable man who remembers not only what is due to others, but himself. There are indelible irrevocable injuries that will not endure to be mentioned. Such is the one you have committed on the man who would have *died* to serve you.

The estrangement, we are happy to learn, did not last long. It was at this time also that Godwin had as pupils Willis Webb, who afterwards went to St. John's College, Cambridge, whence he wrote grateful and priggish letters to his former tutor, and Thomas Cooper, whose later experiences as a strolling player are preserved in a series of most amusing letters. The correspondence of both these pupils gives evidence of the confidence which through all his life Godwin inspired in the young. For them, indeed, he who to many appeared a cold unimpassioned philosopher was accustomed to abandon his reserve and give out a quick and eager sympathy. On one occasion Cooper, whose sensitive nature had been irritated by some severe remarks of Godwin's, left in his tutor's way a paper on which he had noted them down with remarks of his own. Godwin's answer, which will be found in p. 39 of Mr. Paul's first volume, may explain the influence which he had over those with whom he came in contact.

On the year 1789 Godwin made this note:—

This was the year of the French Revolution. My heart beat high with all its ardours for the enjoyment of liberty. I had been . . . three years upon earth a Republican . . . . Yet I was far from approving all that I saw even in the commencement of the Revolution. . . . . I never for a moment ceased to disapprove of mob government and violence, and the impediments which I found to be thrown in the way of the progress of truth and reason. I desired to behold a change only as should flow purely from the clear light of the understanding and the erect and generous feelings of the heart.

His dream was of a time when all men should find sufficient good government in reason, and vice should in consequence disappear altogether: this view, together with much that was unpractical, he put forward in the *Political Justice*, published in 1793, of which one result was that, as Mr. Paul says, "he who was to the one party all but an inspired teacher, though the nature of the inspiration would have been hard to define, was to the other party a revolutionary Atheist, who went in danger of a prosecution for treason." The work was begun in 1791, of which year Godwin wrote, "This year was the main crisis of my life." He then first gave up writing the historical part of the *New Annual Register*, which he had done for seven years. How thoroughly he had performed this task is shown by the extracts given in Mr. Paul's 9th chapter. In 1792 Godwin's intimacy with Mr. Inchbald began. Her first letters are full of interest, and are what one would expect from the writer of *A Simple Story*; her behaviour at a later time, dating from Godwin's marriage with Mary Wollstonecraft, was, to say the least, ignoble. It would be impossible in a brief space to give a better notion of the aim and scope of the *Political Justice* than in the words of Godwin's biographer:—

These writings were, however, one and all, provisional and preparatory. The [illegible] forgotten; the fate, with the rarest exceptions, of anonymous writing. But the publication of "Political Justice" was an epoch in English thought. It was coincident with the rise of a school of philosophic radicals, and in large measure placed in clear words the views of that school, on many, though perhaps not all, of the subjects treated. There were, however, very few who carried out logical conclusions so consistently and unshrinkingly as Godwin. He alone formulated, among his political judgments, the extreme severity of social principles, the denial of all play to feeling and affection, which Fawcett and Holcroft had more loosely held as matters for informal discussion.

By the words "Political Justice," the author meant "the adoption of any principle of morality and truth into the practice of a community," Vol. I. p. 19, and the book was therefore an enquiry into the principles of society, of government, and of morals. The first volume deals with principles only; the second with the mode in which those principles would exhibit themselves in politics and in society.

In 1793 *Caleb Williams* was begun, and the next year it was published. When it was about three-fourths finished Marshal obtained the reading of it, and wrote to Godwin that, if he had any regard for his own reputation, he would put it in the fire. That the story has survived, and, as Mr. Paul says, "probably been read by very many persons who, but for it, have never heard of Godwin," is proof that Marshal's judgment was mistaken. The dramatic version of it by Colman, under the title of *The Iron Chest*, in which Kean played Mortimer (Godwin's Falkland) is perhaps even better known.

Late in 1793 took place the trial in Scotland for treason of Muir and Palmer, upon whose treatment after conviction on very insufficient grounds, Godwin wrote a strong and bold letter—how bold it is difficult now to realize—to the *Morning Chronicle*. In the next year followed the trial in London on a like charge of Joseph Gerrald, who was sent to New South Wales, and died there; and not much later, that of Holcroft, Horne Tooke, and ten others. On this occasion, after the charge of Chief Justice Eyre, Godwin, burning with indignation, wrote, or rather, to ensure speed, dictated, an answer to the charge:—"He looked on this crisis as one of awful moment to all Englishmen." His answer produced the desired effect; he exposed with keen logic and in eloquent words the bewildering subtleties by which Eyre had striven to stretch the law far beyond its definition in the statute; and by his efforts, the people who had believed in the discovery by the Ministry of a dark conspiracy learned that, merely to overawe the country, it had been attempted to dress out what was nothing but a reasonable dissatis-

faction in the scarlet robes of rebellion. Some time later Horne Tooke asked Godwin if he were the author of this answer; on learning that he was, he begged to shake him by the hand, and then bent down and kissed it as the hand which had saved his life.

During this time an intimacy was gradually being formed between Godwin and Mary Wollstonecraft, author of the *Vindication of the Rights of Woman*. We have not space here to dwell upon her story; much light is thrown on her character by the letters collected in the volumes before us. The marriage between her and Godwin took place on March 29th, 1797. Godwin takes no notice of the event in his diary. That his love of abstraction, of being above the usual cares of the world, added some merit to her extreme devotion to him may be seen from these letters, the first written before, the second after, the marriage:—

Jan. 27, 1797.

I am not well this morning. It is very tormenting to be thus, neither sick nor well, especially as you scarcely imagine me indisposed.

Women are certainly great fools, but nature made them so. I have not time or paper, else I could draw an inference, not very illustrative of your chance-medley system, that I escape the moth-like opinion; that is room enough in the world, &c.

April 11th, 1797.

I wish you would desire Mr. Marshal to call on me. Mr. Johnson or somebody has always taken the disagreeable business of settling with trade people off my hands. I can perhaps as well as yourself to do it, and my time appears to me as valuable as that of other persons who attend to employ themselves. Things of this kind are easily settled with money, I know; but I am tormented by the want of money, and feel, to say the truth, as if I was not treated with respect, owing to your not having mentioned it.

We must pass from this to the date of Mary Godwin's death, after her confinement, on the 10th of September, 1797. Godwin's diary for that day contains only the words "20 minutes to 8"—the time of her death. On the same day he wrote to Holcroft and to Mrs. Inchbald, who sent a marvellously heartless reply.

It is curious, perhaps more curious than pleasant, to find Godwin, only a year after his wife's death, attempting to prove again that he was not bound by his theoretical objections to marriage by proposing to a Miss Lee, who refused him, and making some keen comments on the margin of one of his letters. In the next year *St. Leon* was published, and in 1800 Godwin went on a visit to Curran at Dublin, of which a record is given in letters to Marshal. In 1800 came the tragedy of *Antonio* already referred to, and in 1801 he was married for the second time to Mrs. Clairmont. The correspondence in the second volume, which opens with these two events, has a wider interest than that in the first, containing, as it does, letters from Lamb, Coleridge, Wordsworth, Shelley, and Bulwer, very few of which have before appeared. Shelley's first letter was written from Keswick in the earlier days of his marriage with Harriet Westbrook. We give part of it here:—

You will be surprised at hearing from a stranger. No introduction has, nor in all probability ever will, authorize that which common thinkers would call a liberty. It is, however, a liberty which, although not sanctioned by custom, is so far from being reprobated by reason, that the dearest interests of mankind imperiously demand that a certain etiquette of fashion should no longer keep "man at a distance from man," and impose its flimsy barriers between the free communication of intellect. The name of Godwin has been accustomed to excite in me feelings of reverence and admiration. . . . I had enrolled your name on the list of the honourable dead. I had felt regret that the glory of your being had passed from this earth of ours. It is not so. You still live, and I firmly believe are still planning the welfare of human kind. I have but just entered on the scene of human operations, yet my feelings and my reasonings correspond with what yours were. My course has been short, but eventful. I have seen much of human prejudice, suffered much from human persecution, yet I see no reason hence inferable which should alter my wishes for their renovation.

Want of space compels us to leave untold the story of Shelley's elopement and subsequent marriage with Mary Godwin; and forbids us also to touch upon the later years, which were not the brightest, of Godwin's life. This is of the less consequence, as it would be hard to tell these things better or more concisely than Mr. Paul has done. It is not too much to say that not one of his pages is without interest; and to this we may add that he has shown a rare skill and discretion in dealing with his materials.

LORD DUNRAVEN'S IRISH ARCHITECTURE.*

THIS splendid volume is a real labour of love on the part of both author and editor. The present Earl of Dunraven has given, by way of preface, a slight sketch of his father's life, or rather of his character and pursuits, from which many will learn for the first time how many various subjects had at different times occupied his mind. "Being a man possessed of quick perceptions rather than of a powerful grasp of mind, of untiring industry, and endowed with an energy and zeal for learning that never flagged, he succeeded in acquiring much more than a mere superficial knowledge of these various sciences." Of the subject to which the studies of Lord Dunraven's later years were almost wholly devoted, the subject of Irish antiquities, he had certainly very much more than a superficial knowledge. Here he was indeed at home, as one of the most diligent of the rational school of Irish antiquaries. To enter into the real difficulties and the real merits of that most praiseworthy class of inquirers, a man must either be an Irishman himself or else he must be the opposite to an Irishman; he must be a man who takes so wide a grasp of things and can compare so many countries that he can afford to let Ireland come in in its right place and take its fair share. The mere English, even the mere English and Continental inquirer, who has no sound grasp of history, can never understand the peculiar position of Ireland. That position is easily summed up in the fact that Ireland not only never formed a part of the Roman Empire, but that it got its Christianity, doubtless from some source within the Empire, but not from Rome in the same sense in which England, and afterwards Scandinavia, got theirs. This at once distinguishes Ireland from all other Western countries, and makes great caution needful in applying to Ireland many rules which are sound enough when applied to other Western countries. In short, Ireland is yet more truly "alter orbis" than Britain itself. Therefore in no country were native forms of art so likely to develop themselves as in Ireland. There were no Roman models, and there was plenty of stone. Arguments about "timbrian," absurd enough in England, would be yet more absurd in Ireland. It was only in the natural course of things that there should be in Ireland a class of buildings which, for antiquity and material, have no parallel in England. The Irish antiquary is under a special temptation to give his buildings too early a date. Dr. Petrie, in his later years, allowed that he had himself done so in many cases. On the other hand, the English antiquary often fails to understand the position of his Irish brother. He is apt to be hard on him if he puts a thing, say in 500 B.C., which he should be inclined to put in 1000 B.C., forgetful that the Irish antiquary is fighting against enemies who would place it in 1000, or perhaps a long way before 1000 B.C. We have often said that, considering how little Dr. Petrie knew of any country but Ireland, the general accuracy, the invariably rational character, of his conclusions is somewhat wonderful. Lord Dunraven started from the starting-point of Dr. Petrie's discoveries, adding a large stock of knowledge of other countries which Dr. Petrie did not possess. He had those special advantages for the work which he undertook—namely, a systematic treatise on Irish architecture from the earliest times. This work he left unfinished. If, in the case of one who is gone, we may bring in somewhat more of personal memory than is commonly becoming in a critical notice, some readers may like to know that the researches on Ravenna and other Italian cities of which they saw the results some years back had, for one among several objects, that of helping Lord Dunraven's Irish researches by the analogies, or lack of analogies, between the towers of Ireland and of Italy. Lord Dunraven died just too soon to know the result of those researches. In his present volume he does not come to the round towers, and we know not whether he left any actual materials for the discussion of them. The present volume deals only with the Pagan and the earlier Christian buildings.

The work which Lord Dunraven has left behind him has found a worthy editor in Miss Stokes. That lady, as is known to many, is herself an accomplished Irish antiquary, and no one could have been found better fitted to be entrusted with the care of Lord Dunraven's materials. The book of which the first volume is before us is a large and sumptuous one, richly illustrated both with elaborate photographs and with ground-plans of the places described. It takes in only the earliest classes of Irish remains, the Pagan forts, the primitive Christian cells, and the earliest churches. These all hang together. Ireland, like Rome, but unlike the rest of Western Europe, really has a native Christian style of architecture—we know not how else to put it, though the words "style of architecture" hardly apply to buildings so utterly rude—growing out of a native Pagan style. There are remains in Britain which answer more or less exactly to the forts and the cells of Ireland; but they are few in number and confined to particular districts; they have no influence on later buildings, and no one supposes them to be the work of English hands. In Britain there is a wide gap—the gap caused by Roman and English conquests—between the primæval remains and the very earliest churches. In Ireland, where there was no Roman conquest, no English conquest in the sense which those words bear in Britain, there is an unbroken chain of remains from the Pagan forts up to Cormac's chapel and the neighbouring round tower. It is this which makes Irish antiquities so unique in their character, a character which is the result of the history of the country, combined with the abundance of stone. This unbroken continuity is well brought out in the series of examples given in Lord Dunraven's book. He begins with the forts on the Isle of Aran, including the magnificent defensive work on the middle island of Aran known as Dún Conchobhair. Within the range of its primæval walls are still some remains of *clochauns* or beehive-shaped cells. But here again the continuity of style comes in in the most striking way. For the primitive fashion of building goes on in Aran to this day, though we gather that they have lost the ingenious fashion by which roofs were constructed in primitive times, much as an ordinary English mason sometimes seems to have very little idea of turning an arch. Several other forts follow, and then comes the section on early Christian monuments, which begins with the remains on the greater Skellig Island, off the coast of Kerry—a third St. Michael's Mount to be set against those of Normandy and Cornwall. One most striking photograph brings out most strongly the scenery of the island, while others set before us the wonderful path up to the

* *Notes on Irish Architecture.* By Edwin, Third Earl of Dunraven. Edited by Margaret Stokes. Vol. I. London: Bell & Sons. 1875.

monastery called the Way of the Cross. The remains of the monastery consist of several beehive-shaped cells, with lintel doorways, and of a small and rude church, which is however a reconstruction of later times. One cannot doubt that such an establishment as this dates from the earliest times of Christianity; but Lord Dunraven was not able to find any direct notice of the place earlier than 823, and in the true critical spirit he points out the rashness of earlier writers who have spoken positively of earlier dates without any authority to go by. Lord Dunraven goes on with a crowd of examples of the primitive cells in churches, one of the most famous of which is that of Gallarus. This is a perfect study of this primitive style of building, common indeed to Ireland with many other parts of the world, but common, we believe, neither from direct transmission nor from common origin, but because in all times and places like causes produce like effects, and the arch, like many other things, has been invented over and over again. Here we see the strivings after the arch which are found in so many distant countries, and we see also, what so many examples teach us, and what is so important and seemingly so difficult to be understood, that the mere form of the pointed arch is at least as old as the mere form of the round. At Leabmoluga, in the county of Cork, there is a most striking doorway, two huge stones standing as jambs, supporting the lintel. Both jamb and lintel show the slightest beginnings of strictly architectural ornament in the square-edged line which may be traced in various forms through a good deal of Roman and primitive Romanesque work.

Thus far we have been dealing with buildings of the very rudest kind, without cement, mere dry walls. The next part of the book comes to the early churches where cement is used, beginning with those churches which were, according to the earlier arrangement, without chancels. The arch gradually comes in, the form of the arch before its construction; for the Irish builders seem to have begun very early to make narrow, round-headed windows, where the head is merely cut out of one stone. Still it seems impossible to avoid the conclusion that there really was a native Irish style which worked out for itself distinct forms of the entablature construction. Anywhere else we should say that the great stones of which many of them are built, and the square-headed doorways sometimes displaying a considerable amount of ornament, as at Temple Martin, in p. 105, and still more at Maghera, in p. 115, came from a Roman source; and it is of course possible that pilgrims and other travellers may have brought home some notions of Roman buildings. Still the case of Ireland is quite different from the case of those countries where there were actual Roman remains to influence the local style. Even if some general hints came from a Roman source, the spirit of the style, and the way in which it is worked out, are wholly native. The use of sloping sides which goes on with the buildings which use the arch is a most marked feature; it came naturally in the early constructions, and is carried on in later buildings which approach more nearly to the ordinary models of the rest of Europe. Towards the end of the volume some examples come in which belong to this later style, chiefly because many of the earlier buildings have been altered or added to. Thus at Tuaim Gréine, corruptedly Tomgraney, in the county of Clare, there is a church of the earlier date, built of massive polygonal masonry with large stones closely fitting, while the chancel is of the local Irish Romanesque. Now there seems distinct evidence that a church, by no means the first church on the spot, was built here in the year 964. Which of these two parts was built then? It is hard to conceive that work so much like our familiar Norman can be so early as 964. Yet it is almost as strange if "the great church of Tuaim Gréine" was nothing more than the little primitive structure. But we will not rush hastily to any judgment till we have seen those parts of Lord Dunraven's book in which he deals with the later and more enriched buildings. We hope that there is something to come in the shape of dissertation, giving the general results of Lord Dunraven's researches. At present, besides the introduction by Miss Stokes, we have only notes and illustrations of particular buildings. As Lord Dunraven, though a follower of Dr. Petrie, allowed, with Dr. Petrie himself, that several of the buildings had been dated too early, we should be well pleased to see Lord Dunraven's last views on the matter more at length.

LAMAN BLANCHARD.[a]

LAMAN BLANCHARD, who was born in 1804 and died in 1845, reckoned among his most intimate friends the late Lord Lytton, Thackeray, Mr. Browning, Charles Lamb, Leigh Hunt, and Dickens. These, and others like them, made up that genial and brilliant brotherhood, united by common tastes and common struggles, which Thackeray himself has so often and so graphically drawn, and which formed the training school of many who have since attained high rank among the literary men of this century. On the principle "noscitur a sociis," one might naturally expect to find the work of a man who lived in this atmosphere of genius bearing marks of the inspiration of such association, and of ability fitting him for it. Other causes, too, inclined us to hope that we should discover in these poems much to enjoy and praise, and little to blame. The character of Blanchard, as drawn (and we have no reason to believe otherwise than faithfully) in the memoir prefacing this book, is so charming and loveable, and his early struggles, early marriage, and early death by his own hand in a fit of morbid melancholy induced by the loss of his wife, are so pathetic, as to render adverse criticism, should it appear inevitable, a painful and ungrateful task. Moreover, the opinions of men such as Mr. Browning, the late Lord Lytton, and Charles Lamb, who all spoke in unqualified praise of many of the poems before us, seemed to justify our sanguine expectation. But, after reading the book, we are driven to the conclusion that the very qualities which prepossessed us in Blanchard's favour must have operated still more strongly to influence the judgment of those who were in daily intercourse with him; and it is therefore more conducive to fair criticism to dissociate the book from the author, and take both as we find them.

The poems are divided into "Poems of Sentiment" and "Poems of Humour," and are prefaced with a memoir of the poet from the pen of his godson and son-in-law, Mr. Blanchard Jerrold, who has, we presume, also edited the book. And here we must express our regret that both memoir and editing show traces of surprising slovenliness and want of care. For instance, the Memoir states (p. 2) that Blanchard, the son of a freeman of Great Yarmouth, was in 1830, when only twenty-six years old, "presented with the freedom" of that "city." Now not only is there no mention of this occurrence in the notice of Blanchard given in Mr. Palmer's recently published and exhaustive *Perlustration of Great Yarmouth*, but we learn from the same work (Vol. I. p. 65) that the sons of freemen of the borough were themselves, by right and inheritance, freemen. In all probability the true state of the case is that Blanchard, on the occasion referred to, took up his freedom, as it is technically called, which is a very different thing from having it presented to him. Again, at p. 36 of the Memoir, we find the author of *Ion* spoken of as "Sir Serjeant Talfourd," a blunder which would be more accountable had it come from the other side of the English Channel. For the rest, the Memoir is fairly written, though we fail to see the utility of inserting a long memorandum, covering twelve pages, from the late Lord Lytton, relating to a book on the boyhood of great men which Blanchard contemplated, but never accomplished.

But in the editing of the poems the carelessness we have complained of crops up everywhere. Such slips as "I" for "It" (p. 107), "there" for "their" (p. 119), "though" for "thou" (p. 129), "in" for "is" (p. 147), "drinks" for "drink" (p. 175), "till" for "twill" (p. 183), "musical natural" for — we hardly know what (p. 139), and many other such, with errors in punctuation innumerable, and lines whose lack of metre and sense shows that a word or two has been left out or put in, are discreditable to the editor, and, like Mr. Parker in Sir George Rose's famous epigram, "make that darker which was dark enough without." For one of the chief faults we have to find with Mr. Blanchard's serious poems is their intense obscurity, or, in many cases, absolute incomprehensibility. Ever since David expressed his intention of opening his dark saying upon the harp, it has been the acknowledged privilege of poets to deal largely in the mystical. Mr. Browning's fame does not rest on the simplicity of his style or the perspicuity of his thought, and even of Mr. Tennyson we might sometimes say what he says of an angel in *In Memoriam*, that "his words were hard to understand." But Mr. Blanchard is occasionally far more inscrutable than either of these; and with this difference, that it is difficult to resist the suspicion that, if some being more intellectual than ourselves were to succeed in finding out what he does mean, the kernel would hardly repay the labour expended in cracking so hard a shell. To take the very first page of the book, the opening lines of the poem intituled "The Poet's Bride"; we should be glad to see what sort of paraphrase the average reader could produce of the following:—

> She stood beside the ruin of a wall
> Painted and carved; where unplucked flowers and moss
> O'ergrew the beauty of the ruling Cross:
> And sainted foreheads, which in other time
> Had bowed their earth in heaven's cloud-columned hall,
> Were queenly wreathed in mockery of age.
> And here a bank its purple shadow kept
> Above a lake, where Hope perchance had wept,
> Ere yet a tear was made the mirror of a crime.
> And here a monument whose ice-like page
> Dropt as the day perused it—though a bard
> Had found therein the coldness of reward.

To justify still further the charge of obscurity against Mr. Blanchard we append the following specimens, taken pretty well at random from the poems:—

> And blood of lambs not destined for the knife
> Of luxury or of sacrifice, atoning
> For man's proud evil with their harmless life,
> Ran pure as mountain water, calmly clear:
> And fed with freedom hearts unworn with moaning.—P. 98.

> Not a leaf but whose light curl can tell
> Of waters playing on their coral flutes.—P. 99.

> The natural smoke from the morning's lamp
> Hath a sound as it walks, though you hear no tramp.—P. 103.

We ought, perhaps, in fairness to mention that this passage occurs in juxtaposition with some remarks about morning mist, which may or may not tend to elucidate the meaning.

> Wit took shame
> To twine a wreath for Wisdom's naked name.—P. 132.

[a] *The Poetical Works of Laman Blanchard.* With a Memoir by Blanchard Jerrold. London: Chatto & Windus. 1876.

This we are reluctantly compelled to leave for the ingenuity of posterity.

> Observe the vow
> Of princes unfulfilled, and the slow plough
> Crushing the peasant's hopes.—P. 142.

The first part may be a prophetic allusion to the repudiation of his financial obligations by the Sultan; but, with regard to the second, we would suggest that, in modern agriculture at least, the peasant, however sanguine, does not usually indulge in hope for much until he has not only ploughed but sown.

From the narrow field in which we have culled these flowers of poesy, it may be inferred that such abound throughout the book, and the inference would be a true one. But there is another source of obscurity in Mr. Blanchard's poems which occasionally becomes most bewildering. He has a way of making his *dramatis personæ* physical and spiritual, material and immaterial, in the same breath, and predicating of them attributes human and ethereal, with an indifference most confusing. For example, speaking of the poet and his bride, he says (p. 91):—

> Now they were
> Throned on the bosom of their love, uniting
> In one small circle all that least can err,
> Sting and deceive, with all that most can bless,
> Support and shield in virtue's pathlessness.

Without pausing to inquire what "virtue's pathlessness" may signify, we would remark that all this, allowing for the license of poetry, is strictly consistent with their being mortals, as indeed we gather from other parts of the poem the author intended them to be. But he goes on to say:—

> They winged them o'er the fields of air, alighting
> In some lone spot to talk on fairy themes;
> Or twined within the hollow of a shell
> Whose sea-voice sang to them, steered their true dreams.

Many instances of such confusion are to be found, notably the verses addressed by the poet to his pen.

The sonnets, which form a considerable part of the volume, are of the usual type, and neither above nor below the average. Then we have one or two poems in the style of Shelley, and one or two in that of Wordsworth; in either case, we regret to say, falling lamentably short of the model. Another imitation, "A Ballad à la Moore," has, however, caught some of the spirit of its original.

Mr. Blanchard deals largely in extravagant and somewhat meaningless similes:—

> She lived as lives the moon, for her dark lord,
> Or rainbow, scabbard of the tempest's sword.—P. 95.

It is with far more poetry and fitness that, a little later, he speaks of the rainbow as "heaven's lyre."

> A pine-tree soared
> Sun-bronzed, like Triumph on a pedestal.—P. 99.
>
> The spell may be surest when feelings come forth,
> Like a lily resisting the winds of the north.—P. 152.

In fact, the poems are overloaded with similes and metaphors, most of them inappropriate. But, as a set-off to this high-flown language, the poet occasionally adopts a simplicity of language which verges on puerility. At p. 116 he says that the water in a lady's bath

> Will rise to meet her on her *cool career*.

At p. 119, describing a village congregation going to church, he mentions that

> Virgins, with flushed but placid face,
> Their grandsires led along.

If this means anything, it records the homely fact that the young women were warm with walking and the exertion of getting their grandfathers to church.

We are glad to say, however, that there are some passages in Mr. Blanchard's verse of which we can speak more favourably. The following description of evening at p. 138 is pretty, though, as usual, too redundant in simile:—

> Already hath the day grown grey with age;
> And in the west, like to a conqueror crowned,
> Is faint with too much glory. On the ground
> He flings his dazzling arms; and, as a sage,
> Prepares him for a cloud-hung hermitage.

And here is another fancy of the same kind, a description of an after glow, though it is open to the same accusation of being too crammed with similes; and we must also take exception to the unpoetical word "heaves," which Mr. Blanchard here and elsewhere, possibly owing to the exigencies of rhyme, employs as a synonym for "stirs":—

> Nothing heaves
> As Time looks back upon the path he leaves.
> A scarce felt flush is seen to live and die,
> As if the Sun re-oped his heavy eye,
> Then by some tending cloud was fanned to sleep,
> And bathed his burning forehead in the deep.
> Lo! ere he drops, how fast the vapours ride
> To dip their feathers in his wealthy tide;
> While some to hover round his head repair,
> And wind their pallid fingers through his hair;
> Some flap their wings of snow amid his breath,
> And on his bosom drink a golden death.—P. 175.

Of the humorous poems we have left ourselves but little space to speak. Some emulate the style of Hood in making each stanza end with a joke, after the fashion of the immortal "Ben Battle" and "Mary's Ghost." Perhaps the best is one on "The Art of Book-keeping," in which the author bewails the loss of books lent to friends and not returned. We may quote the following:—

> New tales and novels you may shut
> From view—'tis all in vain;
> They're gone—and though the leaves are "cut"
> They never "come again."
>
> A circulating library
> Is mine—my birds are flown;
> There's one odd volume left, to be
> Like all the rest, a-lone.

Still this sort of thing becomes a little wearisome when carried over five pages. But the most serious disadvantage of these poems is that their political and social allusions are now entirely out of date. Nearly fifty years have rendered the public somewhat indifferent to an "Epitaph of 1830"; imaginary Parliamentary debates lose their flavour when foot-notes have to be appended to explain who were the members represented as speaking; the political interest is gone which might otherwise have rendered a supposed dream of Sir R. Peel, when out of office, amusing; we imagine that M. Simpson, M.C. at Vauxhall, and his eccentricities are unknown to the present generation; photography is no longer a new invention, as it was in 1842, and so a long poem on its rise into popular favour, and early shortcomings, falls rather flat now; and we no longer sympathize with the description of the terror excited by the approach of a comet in 1834. But Shakspeare is never out of date, and the sketches of Shakspearian characters contained in a poem written by Blanchard on the first page of a book called *Mulberry Leaves*, compiled by a Shakspeare Club called the Mulberries (though why Mulberries we entirely fail to see), are graceful, and as easily appreciable now as then.

On the whole, this book will certainly be a disappointment to those who, never having previously read Mr. Blanchard's works, had a vague impression that he was one of a knot of wits and poets. It was in the "Keepsake" and "Album" period that he flourished; and his vagueness of thought and language, and sentimental vapouring, are very characteristic of the sort of poetry which then passed current. It is from this point of view alone that the volume is worth notice. Any attempt to revive Laman Blanchard as a poet on his own account is hopeless.

ERSILIA.*

THE author of *My Little Lady* has not improved on her former work, and we are sorry to have to say that *Ersilia* is a decided falling off from a story which seemed to promise a new writer of considerable ability and charming qualities. The present book is slender in construction and lumbering in treatment. It leaves on the reader the impression of a monologue rather than of a drama—graceful but feeble, and, such as it is, the tenderness sickly rather than pathetic. It is not exciting, nor even interesting, in plot; for the catastrophe is told in the "prologue," and the conditions are so transparent that as the story proceeds there is no room left for doubt or mystery. It is all plain sailing from first to last—from the predestined love affair between Ersilia and Mr. Fleming to the identity of M. Roussel with Prince Zaraikine; from Humphrey's misplaced attachment to the hapless fate of the two lovers. A novel must be a very powerful bit of character-painting indeed which can safely venture thus to dispense with intricacy and uncertainty alike, and we do not find this power in *Ersilia*. On the contrary, those of the personages who stand out from the rest at all stand out as figures in a picture, not as creations of literature, and are not characters so much as portraits. The heroine herself is precisely one of the "Lady" women with whom the præ-Raffaellite school has made us familiar; tall, slender, melancholy, mediæval; fond of half-tints and straight-cut, flowing garments; much given to gathering flowers, and sure to possess a necklace of amber beads, good for composition; a very fair and stately person, but not comfortable, and giving one an unpleasant impression of posing and self-consciousness. The scenes, too, are scenes that would paint better than act; and, indeed, the characteristic defect of the book is that it is painting, not narrative—a series of pen-and-ink sketches rather than a continuously developed story brightened by powerful and dramatic scenes. For, just as painting may be too statuesque, so may literature be too picturesque, using the word in its true, not arbitrary, meaning; and *Ersilia* is a striking example of this. The author succeeds best with certain of her characters of the second degree; and chiefly those whom she does not like; such as Mrs. Grey, vulgar, shallow, pretentious, worldly; her good, uninteresting, formal little daughter Rose; poor troubled and untidy Charlotte, with less brains than feelings; the "far-away uncle," prompt, cold, and businesslike; and the miserly old grandfathor, who makes every one unhappy by his fierceness and ill-temper. In these she shows a sense of humour which helps to enliven the somewhat oppressive lugubriousness of the story—a lugubriousness that is greatly enhanced by its monotony of style, and by the adoption of that dangerous method of autobiography which ought to be employed only by the first masters in the craft, and by them with caution and sparingly.

The story is exceedingly simple. It sets forth the boyish love of the narrator, Humphrey Randolph, for his cousin Ersilia; a

* *Ersilia*. By the Author of "My Little Lady." 2 vols. London: Hurst & Blackett. 1876.

love that began in childhood when he was a little fellow of nine and she was "a slim little maiden of twelve years in a dim sea-blue frock and amber necklace, with loose brown hair falling upon her neck and shoulders, and in her skirt, which she held gathered up in front, a great heap of wet apple-blossoms." Humphrey has been transferred from his mother's home to the house of his far-away uncle, who lives in Kensington, and is going to send him to school; and he is moping in the parlour when Ersilia comes in from the garden, with her wet apple blossoms and her sweet instinctive womanliness, to do her best to comfort him. "The two children were friends directly. She was three years older than Humphrey, but scarcely less of a child, I fancy, than he was," says the author, who is himself Humphrey; and who a little further on adds, "I think she saw Humphrey's tears, though the boy tried hard to hide them"; this being the curious mixture of the biographical with the autobiographical manner of narration that helps to make *Ersilia* vague and watery. The real story opens with the companionship of Humphrey and Ersilia, when he was a young artist of rising merit, and she the reputed widow of Prince Zarnikine, an unredeemed scamp who had deserted her after having married her for her money, being at the time "madly in love with a Polish Countess who was already provided with a husband." Ersilia and her chaperon, Aunt Mathilde, or Mlle. de Brissac, are at Eaux-Bonnes, where Humphrey stumbles on them by chance, and forthwith loses his heart to the beautiful woman as he had formerly lost it to the pretty child. Her husband had been reported dead for nearly a year, and she is beginning to enjoy life in the melancholy manner of her kind. She embroiders, as befits her type; and she is laudably fond of walking. Sometimes she goes too far, and then has to jolt home in rough country carts with Humphrey or, shipping in this wise:—

> She smiled as she spoke, to reassure him, and in the dim light he seemed to see all the mystery of those far-shining heavens reflected in her eyes, and was satisfied. As for him—that fair presence was near him, that sweetest influence was upon him; I think that at that moment he would have asked nothing better of life than to go on thus for ever through that clear darkness, beneath those stars, in that immense harmony of earth and heaven. Long afterwards—in truth, it was but a few months, but there are times when life is not counted by the calendar—long afterwards then, I say, Humphrey, making another star-lit journey with this same companion under other skies, looked back with a sort of wondering doubt on the unexpectant tranquillity, the accepted peace of this summer night—as one who, waking in the frozen darkness of a winter morning, doubts of the golden light, the birds and flowers of the summer that has been.

But all this sentimental joy is soon broken up, for there comes on the scene Arthur Fleming, Humphrey's master in art, and the evidently predestined lover of the fair Ersilia. Perhaps the vaguest personage in the whole gallery is this Arthur Fleming, whose influence is so important. We are told that he is pure and noble, high-minded and a good artist; that he is not strong, and that he is not young; but these are mere words, and give no distinct image of the man as he lives and moves through the pages. We cannot for the life of us understand why Ersilia falls in love with him so quickly and so devotedly; for the only thing that he really does is to get ill, and be somewhat too impatient in his convalescence for either a strong man or a sweet soul. It seems to us that the character has been drawn from life, and drawn too close at hand to be artistically correct. It wants the clearness of those ideas which, however they may have been suggested, are in a certain sense an author's own creation by thought and meditation. Here the lines are as indistinct as a badly focussed photograph; while the whole treatment evidently suggests perfect acquaintance with the original. And, from the very fact of that perfect acquaintance on the part of the author, explanatory details and graphic touches are left out for the sake of a more intimate description of thoughts and mental conditions which do not give us character or personality. As we have said, the *raison d'être* of the master is visible from the first, and there is never any doubt about the part which is to be assigned to him. He and Ersilia fall in love with each other, picturesquely not dramatically, as in the following scene:—

> Humphrey, held captive at the card-table by Mademoiselle Mathilde, looked more than once across the room to where, round Mr. Fleming and Ersilia, two wax candles made a circle of light. They shone on the polished floor, on the open music-book resting against the faded red silk back of the piano, and on the subtle harmonies of colour where the tender whiteness of Ersilia's hand met the yellowing ivory of the keys, the yellow whiteness of the lace ruffles round her slender wrist.

Just as evident is the part to be played by M. Roussel, whom Humphrey is the proximate means of bringing into the group. Notwithstanding all the quiet assertions of this rheumatic and mysterious man that he had seen Prince Zarnikine drowned, the experienced reader knows that he is telling a falsehood for the occasion, and that he is no other than that personage himself. But the author has, we fancy, to use one of her own favourite expressions, drawn here as much too liberally on her imagination as she has trusted too literally to fact for her Mr. Fleming. The Prince is no doubt a scoundrel, but he is not a fool, and it is to be supposed that he has some kind of meaning running through his life and informing his actions. Not caring for his wife more than for the first passer-by in the street, but terribly hard up for money, we cannot understand why, in the first place, he left her so long without applying to her; or why, in the second, he took such grave exception to her having a lover as to make him fight a duel which was substantially assassination. It was nothing to him whether his wife loved Mr. Fleming or not; his "honour" was not implicated—how could it be when he had deserted her, and "made himself dead" for so long?—and his affection was as non-existent as his honour. Why, then, he should run such risk as must needs attend a duel is a mystery of folly which is not explained by anything that the author says; and his brutality in the interview with his wife is against the natural instinct of such a man as he is depicted. The working of the character altogether is a muddle, and evidently beyond the writer's power; the commingling of brutality with chicanery, of the ruffian with the *escroc*, being as untrue to nature as it is false in art. But the whole episode of Mr. Fleming's death, with all the attending circumstances, reads to us forced and unlikely—something unreal and distorted, and ludicrous rather than touching. It is half the battle of success for a writer to know his own powers, and to be able to measure exactly the tether of his capabilities. Soft and gentle natures suit best the powers of our present author; old-fashioned moralities, and, if she likes, new-fashioned sentimentalities; but the dark and tortuous ways of crime make a road so utterly unfamiliar to her that she lands herself at last in the nonsense of such a character as Prince Zarnikine, which is of the kind known familiarly as neither flesh nor fowl.

We are sorry not to be able to speak with more praise of this book. We thought, as we have said, that *My Little Lady* had introduced us to a writer of sterling merit, and that our literature would be enriched by future contributions of equal value; but *Ersilia* is a decided falling off in literary power, though it is prettily written and delicately portrayed. It is not a novel of character, nor of dramatic situation, nor yet of artistic plot; and we got tired of a succession of mere pictures like the one we have extracted, which are good only as instructions to the so-called "illustrators." We hope that the next novel from the pen of this author will be more perfect in the essentials of a well-developed work of fiction; and that before she writes and publishes again, she will have determined accurately what she can do and what she cannot, what she knows in human life and what she only dreams and imagines.

THE REUNION CONFERENCE AT BONN.*

THIS volume appears at an opportune moment; for the propositions agreed upon at Bonn last autumn are just now under the consideration of the Convocation of Canterbury, and Dr. Pusey's repudiation of them, now so happily withdrawn, had naturally disquieted many minds. It is well, therefore, that members of Convocation should have the whole question before them, and should thus have the means of testing the soundness and relevancy of the various criticisms. Nor, indeed, is the question one which concerns English Churchmen alone, whether in Convocation or elsewhere. The religious and ecclesiastical side of the question is of course the one which is most apparent. But it has other sides to it also which the politician and philosopher may study with interest and advantage. The religious feuds of Christendom have certainly played as important a part in its political as in its ecclesiastical history; and it is probable that they will do so again. Not to go further back, the Crimean war owed its origin to a religious quarrel; yet, how momentous have been its political consequences! It has, in fact, altered the map and reversed the political tendencies of Continental Europe. The collapse of Russia broke the back of absolutism throughout the civilized world, and forced its representatives one by one to govern on constitutional principles, or to make way for those who would. The last to succumb was the Pope, and he has endeavoured to indemnify himself in the spiritual sphere for the loss which he has sustained in the temporal. The Eastern question is coming to the front again; and, however long the skill of diplomatists or statesmen may be able to shelve its solution, it is certain that when the day of reckoning comes the religious element will exercise a powerful influence on the negotiations. We cannot agree, therefore, with those who would dismiss with supercilious gibes such efforts towards Christian reunion as those which have lately been made at Bonn. One of the characteristic traits of British philistinism which excites the derision of foreign publicists is the shallow and ignorant criticism which the English press, for the most part, bestows upon religious questions. The political press of France, of Italy, and of Germany may possibly be more hostile to some of the received principles of Christianity than our own; but at all events foreign writers know what they are about, and understand what they attack. They do not think it beneath them to master the history of Churches and dogmas, even if they should happen to despise them. But, to judge from the usual discussion of religious topics in the English press, one might suppose that some editors are in the habit of considering the qualification of a writer to be in an inverse ratio to his knowledge of the subject. We have frequently had occasion to expose the fresh and ingenuous ignorance which the *Times* always brings to bear on the discussion of theological questions. The public will not soon forget its marvellous articles on the Bonn Conference of last August, and it is probably a wholesome remembrance of the castigation which its ignorance drew down upon it from various quarters on that occasion that has induced it to steer clear of the Bonn Conference in the interval. A speech of the

* *Report of the Proceedings at the Reunion Conference held at Bonn between the 10th and 16th of August, 1875.* Translated from the German of Professor Reusch. With a Preface by H. P. Liddon, D.D., Canon of St. Paul's. London: Pickering. 1876.

Primate's in Convocation this week, however, offered too tempting a bait to be resisted, and the *Times* has availed itself of it to shoot a Parthian arrow at the Bonn Conference. "It is high time," we are told, "the Bishops left off trifling with such matters as the Bonn Conference." The oracle does not tell us when the "high time" struck, or why the Bonn Conference belongs to the category of "trifling matters." Is it still in "an Oriental haze," and troubled with a vision of "Archimandrids"? Anyhow, it has learnt one maxim at least of worldly prudence—namely, that when ignorance wields the pen, it is safer to deal in assertions than to venture on reasons.

It is not worth while, however, to argue seriously against writers who are above the vulgar prejudice which prompts ordinary mortals to avoid the discussion of questions which they consider it beneath them to understand. But crudities which are only amusing in the columns of the *Times* become mischievous when propagated under the ægis of the primatial see of Canterbury. Last Tuesday the Archbishop of Canterbury delivered a speech in Convocation which was, we confess, too mysterious for our comprehension. The subject under discussion was the propositions agreed upon at the last Bonn Conference. The Archbishop "felt unable to sign" them because he thought them "abstruse and difficult." This was natural enough, and, had the Primate left the matter there, we should not feel called upon to do more than admire his caution. Unfortunately, however, he went on to pour a stream of cold water, not only on the Bonn Conferences, but on all attempts at reunion on the constitutional basis of the Church over which he presides. "He felt more in regard to those difficulties which separated the Church from those who were near in language, in sympathy, in regard to the same love of the Bible, and from being fellow-Christians in this country, than he did in regard to those divisions which existed in respect to people who were a great distance from us locally." Does his Grace mean that we are to make no effort to reunite with Christians abroad till we have made up our differences with all our fellow-Christians at home? If so, then *à fortiori* it is a still greater folly to waste our energies and substance in endeavouring to convert the heathen, since they are at a greater distance from us even than Eastern Christians "in sympathy" and in "love to the Bible," and in the fact of their not "being fellow-Christians in this country" or elsewhere. But the Archbishop did not mean this. He says, indeed, that he "should like to begin with those who are about our doors"; but his vision soon expanded, till it rapidly embraced "the Swedish Church," and "the Danish Church," and "the great Church of Luther"; and then, "gazing across the Atlantic," "he could not shut his eyes to the fact that there were some thirty million persons, speaking too the English tongue, and who were Christians, but not members of any Episcopal Church, with whom union might be sought."

All this is no doubt very magnificent; but we do not gather from the Report before us that the English Churchmen who attended the Reunion Conferences at Bonn permitted themselves to indulge in the unprofitable day-dreams on which the Archbishop of Canterbury pathetically declines to "shut his eyes." Their views were not visionary, but practical; and the task at which they laboured, though humble enough in comparison with the soaring heights at which the Archbishop aims, was at all events within their reach. "It seems to be forgotten," as Dr. Liddon reminds us in his valuable Introduction to the English translation of the Bonn Conference Report, "that, while duties are for man, opportunities are from God. Man cannot command opportunities for service; but he should ever be ready to make the most of them. And God guides man into the paths of duty by the opportunities which He offers in the course of His Providence. The Old Catholic movement, as far as English Churchmen are concerned, is an instance of such a guidance." The Archbishop appears to take a different view. Very good. But he is bound to suggest an alternative. Bishop Butler rebuked and exposed long ago the folly of supposing that "to draw pictures of virtue" was the same thing as being virtuous. It is pleasant to sit at home at ease and discourse on the beauty of Christian unity from the vantage ground of Lambeth; but the unity of Christendom will never be restored in this way. A practical beginning must be made somewhere; and, if the Archbishop of Canterbury disapproves of the beginning which has been made at Bonn, it is not unreasonable to ask him to suggest a better. It is all very well to say that "union might be sought," not only with the various Protestant communities at home, but also with "the Swedish Church," "the Danish Church," "the great Church of Luther," and the thirty millions of Mormons, Shakers, and other sects which are as numerous "across the Atlantic" as gnats in autumn. But how is the union to be sought? Will his Grace suggest a basis? Will he draw out the outlines of a concordat? When he has done so we will discuss it with the same candour with which we have discussed the propositions adopted by the Bonn Conference. Of those propositions this at least can be said, that they are on the old lines of English Churchmanship. Is it on these lines that the Archbishop of Canterbury thinks that "union might be sought" with the thirty million nondescripts "across the Atlantic," or with the attenuated Christianity without Christ which now represents, for the most part, "the great Church of Luther"? Unless he has a practical answer to give to these questions, it would surely be better to let others endeavour to earn the beatitude of the peacemakers under the only conditions which at present appear legitimate and feasible. The sneers of the *Times* they can afford to despise; but they have surely a right to expect from the occupant of the see of Canterbury something more substantial and tangible than a solemn discourse on the duty of achieving the impossible, which might be taken as almost a censure on those who were working up to the possible.

These remarks are not misplaced, for the first half of Dr. Liddon's preface to the volume under review is devoted to a refutation of objections against the Bonn Conference, and he exposes, among the rest, the fallacy and the shallowness of such criticism as that to which the Archbishop of Canterbury has given the sanction of his official position. The latter half of Dr. Liddon's preface consists of an elaborate defence of the Bonn propositions against the strictures of Dr. Pusey. For ourselves, we had no doubt from the beginning that Dr. Pusey was under a strange misapprehension; and we have now his own assurance that the fact was so. If Dr. Pusey had read the full Report before he criticized the propositions which were finally adopted, we feel confident that he would never have criticized them at all. Altogether the Report is singularly interesting. Dr. Döllinger's remarkable speeches occupy the greater part of it, and the Report is well worth preserving for their sake alone. We may add that the volume is very cheap for its size and matter.

L'ART.[*]

L'ART, an illustrated review published weekly in Paris, has at least the merit of being very large both in size and conception. The dimension of the page is no less than seventeen inches by twelve; each number contains twenty-four pages; the illustrations every week consist of one, sometimes of two, large etchings; also there are occasional lithographs, likewise reproductions from *croquis* or sketches—somewhat scratchy, it must be admitted—besides woodcuts, which have the merit, with the attendant demerit, of being unlike our English methods. It might have been feared that an enterprise so gigantic—the largest by far now afloat—would have tired out projectors, subscribers, and readers alike. Yet we are glad to say that these three volumes, with a fourth auspiciously begun, show improvement; the latest numbers are an advance on the earliest. The material bulk, however, is a misfortune; *L'Art* can only be carried about in a wheelbarrow.

The preface, which we do not much admire, is in true French fashion; Prometheus, almost as a matter of course, takes part in it. The entire universe would seem to be too small for *L'Art*. Moreover, it appears that "the union of new forces with the intellectual power of humanity" has hitherto been much neglected, and that there is "need of a revival which may stimulate the soul." Then follow platitudes which take a more practical turn. The connexion between art and industry is spoken of as if it were a new discovery. Nothing is to escape notice. "All the art manifestations of humanity in the past and in the present" will be thoroughly studied. Furthermore, "the end is to make war against the theoretic indifferentism which is dominant among artists—an enervate and sterile eclecticism, not less fatal to progress in art than to advancement in politics, philosophy, and morals." This is indeed something like an art journal!

Yet we are bound to acknowledge that much good work has been done during the first year, and the second year, as we have said, bids fair to be better than the first. Turning to the illustrations, we find that they afford some tolerable examples of the various processes of reproduction now in vogue. And we are rather glad to find that no space is given to chromo-lithographs—an art of late made common, and only to be tolerated when at its best. Among the least fortunate of the reproductions are the so-called facsimiles from original drawings or sketches—a class of work which, if turned out of hand well, has much value and attractiveness. Equally unsatisfactory are many of the reprints from old engravings; the lines which ought to be continuous are broken, the chiaroscuro is crudely black and white, and the whole plate tends to rottenness. In certain of these processes photography comes in as an intermediate agent; even in the admirable woodcuts from statues in the Museum of Naples, it is evident that photographs must have aided the draughtsman in his outlines and articulations. The permanence of all the illustrations seems tolerably well assured by the ink used in the printing. The boasted permanence of some processes has proved painfully illusive; take, as an example, that of Poitevin's litho-photography, unfortunately employed in the magnificent albums of illustrations to M. Labarte's *Histoire des Arts industriels au moyen-âge et à l'époque de la renaissance*. These reproductions, first-class of their kind, were published in 1864, and among them we find an imposing ivory triptych and a Byzantine bas-relief in metal, severally "le résultat d'un transport sur pierre, sans retouches, d'un cliché photographique pris par M. Berthier sur le monument." We have watched these "permanent" impressions year by year; at first they had a force, relief, and detail little short of the originals; now, after persistent fadings, they are reduced almost to shadows. We think, therefore, that *L'Art* is wise not to seek support from broken reeds. Besides, photography is not an art, neither are these processes of reproduction more than delicate mechanical operations. The journal before us aims at something

[*] *L'Art; revue hebdomadaire illustrée.* Librairie de l'Art, Hippolyte Heymann, Editeur, 1875.

more; the actual hand of the artist is present, so that some few of these copies, being the product of the free spirit of art, may fairly take rank as originals.

The consummate art of the best French etchers has of late years been made familiar to England by the plates published in *The Portfolio*. Indeed, *L'Art* borrows, with the consent of Mr. Hamerton, the editor of that journal, a "Cour de maison hollandaise," etched by M. Rajon from a choice example of De Hooghe in our National Gallery. For tone, for suggestion of colour, for shadow without blackness, and light without crudity, as well as for a realism which represents illusively the substance and the surface of stone, bricks, and mortar, this plate is almost beyond the reach of criticism. Here is an instance in which a copy takes independent rank as an original. It used to be said that Coleridge in his translation of *Wallenstein* improved upon Schiller; it is almost a truism that a translator of poetry must be himself a poet, and he often shows his divine gift by throwing himself into the real meaning and living spirit of the author with an ardour which carries him a little over the bounds and impels him into the license which is the poet's privilege. In some such way these French etchings are to be read; they are seldom closely literal; they are often to be received as free translations or even paraphrases. One or two other plates deserve examination. M. Jacquemart, known in England among the foremost of French etchers, has found a congenial theme from Capella, a rare artist, resembling Cuyp, of whom we have lately seen two examples among "the Old Masters" at Burlington House. Usually he dwells lovingly among tranquil seas under serene skies; but here, in "L'approche de l'orage," black masses of cumuli charged with thunder not only serve as an element of grandeur, but are skilfully used as a background to a sea horizon flashed with a gleam of light, and to white sails which float peacefully upon the waters unsuspicious of the coming storm. This plate may be quoted as a poetic rendering of a poetic picture. Moreover, its technique shows knowledge and command of the means which may best conduce to the desired ends. Not a single line is lost in blackness, and each in its movement and vital force gains intention and conduces to unity. The chiaroscuro ranges from points of utmost light to masses of deepest shadow, the two extremes being brought together by delicately graduated intermediate passages. From the multitude of etchings in these volumes we select, partly for the sake of contrast, a plate remarkable chiefly for its audacity. "Le vase de Chine," etched by M. Waltner, hardly exaggerates the bravoura of Fortuny. To that singular genius *L'Art* naturally gives many pages. We are glad to add that our English art is not neglected. In recent numbers are seen to great advantage an etching by M. Rajon of a portrait of Mrs. Baldwin by Reynolds, also a companion plate by M. Waltner of a picture of Mrs. Fitzherbert by Romney. Likewise, in a different line of subject, appears "The Environs of Norwich," after Crome. We are informed that one object which *L'Art* has in view is to make our English school in all its branches better known upon the Continent.

French criticisms on contemporary English art are often amusing, though seldom flattering. The expert employed on the Royal Academy of last year, who signs his name as a pledge that he is prepared to take all consequences, treads on such tender ground that we will not attempt a translation, but give in the original the following morceaux:—

M. J. C. Horsley cultive le genre troubadour de pendule. MM. C. W. Cope, A. Elmore, W. E. Frost, ont beau faire appel aux romanciers, aux poètes, aux dramaturges, ils n'en existent pas davantage; les inspirations que demande M. W. C. T. Dobson au foyer domestique ne sont pas plus heureuses; *Troy Weight*, de M. S. A. Hart, n'a d'autre résultat que de rendre incomprehensible son élection académique.

La part des *Associés* n'est pas beaucoup plus brillante que celle des Académiciens mêmes. M. Henry Stacy Marks est boursoufflé, ses prétentions s'accordent fort mal avec ses résultats. M. H. O'Neil s'est permis une *Ophelia* qui passe tout ce qu'on peut imaginer; c'est d'un mauvais invraisemblable; M. E. J. Poynter a de hautes visées, mais, que Rhodope, helas! les justifie peu! M. D. F. Yeames manufacture du papier peint, et quel papier peint! M. J. E. Hodgson est d'un vulgaire désolant.

Wood engravings, some occupying the whole page, others small enough to be worked into the letterpress, naturally play a conspicuous part. The art as practised in France differs considerably from the form it assumes in England. There can be no doubt that the mistaken teaching in our schools of art, a teaching which requires manual finish rather than intellectual grasp of the subject in hand, has tended to reduce engraving, in common with other arts, to monotonous mechanism. This is made manifest on comparison of the *Graphic*, to take one of the best examples in our current literature, with *L'Art*. More nearly approaching, however, to the swing of hand and the dexterous play of line so triumphant among the French were the drawings on wood by Sir John Gilbert published in the earlier volumes of the *Illustrated London News*. Yet *L'Art* adorns its pages with a pretty and highly finished English woodcut by Mr. J. Whymper, after a drawing of animals with landscape surroundings by Mr. Joseph Wolf. This elaborated print, made dressy as for the drawing-room, and not unworthy of comparison with the famous tail-pieces to Bewick's *Birds*, contrasts strangely with the sketchy and pen-like drawings of donkeys, elephants, and camels, by M. Lançon. We understand that the English school of wood-engraving will shortly appear in this French journal in unaccustomed force, a commission having been given to reproduce on a large scale the two pictures by Claude, and the two by Turner, which hang together in the National Gallery. We are told that a couple are finished, and prove wonderful specimens of English manipulation. These will doubtless be printed each on a separate page, the paper good, and with no letterpress at the back; this obvious provision has been made in recent numbers with advantage. The conclusion we come to—a sort of conclusion to which comparisons often lead—is that the French and English modes of wood-engraving have severally distinctive merits and demerits. We are disappointed not to find architectural plates after the style adopted by M. Viollet le Duc, especially as only in France can this excellence be reached. In turning over the ponderous pages of *L'Art*, some woodcuts we meet with are too black; they remind us of certain of M. Gustave Doré's illustrations to the Bible, which might apparently have been executed before the day when God created light. Speaking generally, we would say in favour of the French, on the evidence here and elsewhere before us, that in their engravings, as in their pictures, they desire tone and unity, and detest distraction; that, moreover, they rejoice in suggestive sketchiness with a light and playful hand, knowing by happy instinct just where to leave off. It must also be admitted that, with considerable realism, they unite the higher faculty of dramatic representation of character. This intuition of the indwelling spirit of a subject, this power of accentuating salient points, extends even to landscape, as will be seen in some sympathetic studies from the breezy trees, dewy meadows, and aerial skies of M. Corot. As a favourable example of the criticisms which throughout these volumes accompany the illustrations, we quote the following:—

Quand le paysagiste classique d'avant 1830 prend pour sujet un *Saint-Jérôme* ou un *Silène* il encadre sa figure dans un paysage assorti et fabriqué de toutes pièces, avec des ciels empruntés au Poussin, des rochers pris à Salvator Rosa, des palmiers tirés de Raphaël, des temples grecs copiés d'un bas-relief quelconque.

Chez Corot, c'est le procédé inverse. Il est trop amoureux de la nature pour ne pas l'accepter telle qu'elle est et la respecter; mais, suivant le caractère des sites qu'il rencontre, suivant leur tristesse ou leur sérénité, leur grandeur ou leur grâce, son imagination y évoque naturellement telle vision riante ou sévère de l'histoire profane ou sacrée. La nature, dans les toiles de Corot, reste donc réelle et ressemblante. Et le personnage qu'il y ajoute ne fait, au lieu de l'altérer, qu'en accentuer le caractère.

The letter-press, which sometimes plays only second to the illustrations, is varied so as to meet all tastes. Music and the drama are not excluded, yet articles of this sort avoid the flashiness of those in the older journal called *L'Artiste*. Cookery is not yet included among the "Fine Arts," an omission which would indicate that in Paris they have not heard of the fine things which Sir Henry Cole K.C.B. has been doing among saucepans and gridirons in London and the country. The articles naturally differ in length as in subject; some, such as the illustrated biographies of M. Gavarni, M. Corot, and M. Fortuny, are long and elaborate; others, like the account of Russian art, are short and inefficient. Evidently one purpose in these many-sided views has been to make the journal cosmopolitan; this, indeed, is essential to its existence. A circulation in France alone could not possibly cover the heavy outlay. With this "international" aim, agents, we are told, have been appointed all over the world; eleven are apportioned to London, four to Vienna, three to Naples, and such places as Bucharest are not forgotten. This does, indeed, look like business. With a like cosmopolitan motive, art news is collected even from regions where art scarcely exists. Some of the writers are also foreign to France; thus Mr. Hamerton, who apologizes needlessly for his French, furnishes two papers on "La nationalité dans l'art." As for the general style of criticism in these volumes, it is that which is known as "smart" journalism. It partakes of the off-hand manner of M. About rather than of the student-like mode of M. Gustave Planche, yet it is seldom so brilliant as the writing of that blatant critic M. Théophile Gautier. Within the range of English criticism Hazlitt and Allan Cunningham most nearly approach these French journalists of art. The weakness of the majority of such writers in all countries is that, being Jacks of all trades, discoursing with equal gusto on Paris sewage and the poetry of Parnassus, they have no profound knowledge of or veneration for art. Like Mr. Ruskin, they find it favourable for what Bacon calls "victory of wit and contradiction"; they use it as "a terrace for a wandering and variable mind to walk up and down, with a fair prospect."

MORICE'S PINDAR.*

IT is no light task to attempt a translation of Pindar. The experienced poetess who gave the budding ode-writer a sound hint "to sow with the hand, not with the whole sack," did not accomplish all the good results of her excellent advice. In many of his odes there is such a crowding together of myth, gnome, simile, and metaphor into half a dozen consecutive sentences, that to unravel the tangle in English, without losing the thread of connexion by breaking out into lengthy parentheses, or otherwise departing from the original, is a problem costing as much pains as any that can fall to the lot of a classical translator. Some have tried to solve it by rendering Pindar into blank verse; but there is too much truth in Mr. Morice's remark in his preface, that such a version must needs "bear to its original much such a relation as a ship's mast to a fir-tree, or a trim-

* *The Olympian and Pythian Odes of Pindar.* Translated into English Verse, by the Rev. Francis David Morice, M.A., Fellow of Queen's Coll., Oxford, and Assistant Master at Rugby School. London: Henry S. King & Co. 1876.

clipped hedge to a wild hawthorn; the change in form amounts to a change in essence.' Others, like Mr. Myers, with deliberate purpose, and no doubt with a somewhat justifiable "bibliolatry," resort to a prose version after the manner of our Authorized Version of the prophetic books of the Old Testament. Here, however, the danger is lest the excess of words in the English beyond those of the Greek should be in the ratio of three to one. An example occurs to us in the description of Apollo's rescue of Asclepius from his mother Coronis's funeral pyre, and the words *καιομένα δ'αὐτῷ διέφανε πυρά*, in translating which Mr. Myers has "And the blaze of the burning fiery pile was cloven before him asunder in the midst," whilst Mr. Morice goes to the opposite extreme in his too brief rendering, "The flames around him break." The original means, of course, that the burning pile clave asunder for the god to see and carry off his son; but the pregnant sentence is, we must confess, very hard to handle. If, however, this is constantly the case, it is in some measure a recommendation of Mr. Morice's choice of metre for translating Pindar—that is, an approximation to the original in syllabic agreement of corresponding stanzas, as well as in length of lines in strophe and antistrophe, while for a metrical basis resort is had to English metres with considerable license of combinations and equivalents. The result is certainly effective on the whole, and may claim to be fairly Pindaric; whilst it is no discredit to it that it has a seeming smack of Gray, and flows with a roll which may or may not have been caught from that modern ode-writer. It is impossible to reperuse Pindar—and, to understand his drift, he must be reperused, observantly and studiously—without a sense of wonder at the riches of his treasure-house of poetic expression, and without becoming alive to the curious gnomic element which is continually cropping up amid long and digressive narratives, and which, quaint as it is in its position, is introduced in all earnestness by the poet. Mr. Morice says in his preface that he has endeavoured to sustain Pindar's dignity and elevation in representing these peculiarities through the medium of a translation; and it is impossible to deny that in many passages a sound insight and intention have been rewarded by adequate success. We seem to gain a fair idea of the very exceptional style and manner of the laureate of royal and noble victors, who mingled compliments with admonitions, and was never so dazzled by the sunny fortunes of the hero he panegyrized as to forget or withhold the lessons of desert and destiny, but instilled a cautious dread of Nemesis in the same strain in which he had just extolled the favourite of fortune. Thus, in the second Olympian Ode, amid the praise of Theron of Acragas, a descendant of Polynices and a victor in the chariot race, who was as much indebted to great wealth as to the prestige of family renown and distinction in the games, Pindar cannot refrain from the hint that virtue and moderation must blend with these advantages, if they are to be enduring. The passage to which we refer will give, as rendered by Mr. Morice, a good notion of the moral tone of the great poet he translates, and of the mode in which he contrives in his teaching to attach a sense of responsibility to the possession of wealth and external advantages (Ol. ii. 53-74):—

> What cannot wealth in radiant virtues drest,
> That thrills with eager zeal the inmost breast?
> Like some bright star its glorious beams it throws;
> And blest therewith (none better) Thero knows
> How swiftest vengeance waits the guilty dead,
> And for the sins men sin in realms of day
> 'Neath earth a stern judge speaks the sentence dread
> Of fate's resistless sway.
>
> But by day alike and night
> Upon the righteous rises ever light.
> They dwell in a life unvext of toil. Nor need to task the weary soil,
> Nor waters of the main
> For scant subsistence. Fearless days they gain
> With those Heaven-honoured ones in Truth that joy,
> While sinners cower 'neath weight of dire annoy.
>
> Happiest they that thrice endure
> Through life and death, and still from sin are pure.
> For such Zeus leads to Cronus' tower, where round about the island bower
> Of blessed spirits strays
> Breath of sea airs, and golden flowerets blaze,
> Some on fair trees, some of the waters bred;
> Wherewith themselves they garland hands and head.

Hard as it is to represent Pindar's sense and elevation of sentiment without perceptible abatement in the process, a comparison of the Greek here would justify the impression that the passage is finely and faithfully rendered, and that the translator has caught the tone and spirit of the poet's view of the state of man after death—a view, as K. O. Müller noted in his History of Greek Literature, markedly in advance of that of Homer in his Odyssey.

Amidst the choice of passages of beauty offered in the Olympian and Pythian Odes one may well be puzzled to make an election. The account of the finding of the babe Iamus, child of Evadne and Phœbus, where his mother had hidden him in a brake, all bathed with golden and deep purple gleams of pansy-flowers (perhaps "Viola lutea" and "Viola cornuta," but never surely *wall-flowers*, as Donaldson would have us think), is a very pretty description (Ol. vi. 52-7); and the legend of the discovery of Rhodes, while yet below the sea-surface, by the Sun-god who had been overlooked in the allotment system of Zeus, and of its

> Rising from the hoary deep
> Rich in sustenance for man and plenteous pasturage for sheep

(Ol. vii. p. 30)

is a charming myth, to which our translator has done justice in his version. The description of Ætna and its eruptions in Pyth. i. 21-8 (*τᾶς ἐρεύγονται μὲν—ποτικεκλιμένον κεντεῖ*), recounting the attendant phenomena by day and by night, given truly by Mr. Morice, although not with such literality as to impart stiffness to his version, may serve for a sufficient sample:—

> Gushing thence with purest flow from the secret cavern stream
> Deadly fires. By day in torrents of lurid smoke they sweep,
> But nightly forth, with blood-red gleam,
> Curling flames hurl rocks in thunder adown the level deep.
> And fiercest the fire-jets upward sent
> By the monster engaoled, the gazer's dread, the listener's wonderment.
>
> Bound he lies 'neath Ætna's floor, 'neath its summits dark with trees;
> Stones for coverlet scar all his back as he cowers o'erthrown.

The lava-stream and the imprisoned Typhon's writhings are vividly presented, and we fail to find any word of the original which is not taken account of directly or indirectly in the translation. We must return to the Sixth Olympian Ode to quote Mr. Morice's rendering of its often admired opening. The poet claims that his exordium must be particularly splendid, and, with a reference to the science of architecture, commences the building of his lofty strain:—

> *χρυσέας ὑποστάσαντες εὐτυχεῖ προθύρῳ θαλάμου*
> *κίονας, ὡς ὄτε θαητὸν μέλλομεν ἄρχεσθαι μέγαρον*
> *πάξομεν· ἀρχομένου δ' ἔργου πρόσωπον*
> *χρὴ θέμεν τηλαυγές.*
>
> As who would frame some gorgeous hall, Uprears its porch with shapely wall
> On golden pillars hung:
> Our song's proud front must glitter from afar.

Here the dignity and grandeur of the conception are fitly preserved without recourse to technical terms which import into prose versions and commentaries something foreign and alien to the nature of the Greek.

But the translator of Pindar needs the gift of gnomic sententiousness as much as that of weaving line upon line in what his model calls *κλυταῖσιν ὕμνων πτυχαῖς* ("in song's bright coil," Morice; "in the sounding labyrinth of song," Myers). Two or three specimens of translated apophthegms from the Olympian and Pythian Odes, compared with their originals, will show what Mr. Morice has achieved in this respect. In Ol. ii. 51-2 the poet sings:—

> *τὸ δὲ τυχεῖν*
> *πειρώμενον ἀγωνίας παραλύει δυσφρόνων.*
>
> Victory setteth free the essayer from the struggle's griefs.—Myers.

And Mr. Morice renders—

> Thus to gain
> The prize we toil for breaks the bonds of pain.

Akin to this, in Ol. xi. 22, Pindar has it that

> *ἄπονον δ' ἔλαβον χάρμα παῦροί τινες.*
>
> To success without pain May but few attain.—Morice.

But the vein is one of higher character and morality where he sets forth in a single verse that

> *ἔβαλεν καὶ χάρματ' ἀνθρώποισι Προμαθέος Αἰδώς.*—Ol. vii. 44.
>
> Prescient Reverence to mortals bringeth ever joy and might;

whilst the converse is stated in the sentiment of the Ninth Ode:—

> *καὶ τὸ καύκασθαι παρὰ καιρὸν*
> *μανίαισιν ὑποκρίκει* (38-9).
>
> And misplaced vaunts
> Are songs for a madman's string.

Sometimes a Pindaric saw finds curter measure in the copy than in the original, as where the simile employed in Pyth. iii. 36-7 for the consequences of sin involving those who are near to or connected with the sinner—

> *πολλὰν δ' ὄρει πῦρ ἐξ ἑνὸς*
> *σπέρματος εὐθορὸν ἀΐστωσεν ὕλαν*

is rendered thus succinctly by Mr. Morice:—

> Thus one quick spark fires all the dell.

And sometimes in the translation before us we are surprised to find that a rendering which at first sight we suspect as an anachronistic importation of new ideas into an ancient sentiment is warranted by the inner meaning of the Greek when duly pondered over. Here is an instance. In the same ode from which we have last quoted the poet says to Hiero, in excuse for his mixture of ill health with the gifts of high fortune,

> *ἐν παρ' ἐσλὸν πήματα σύνδυο δαίονται βροτοῖς*
> *ἀθάνατοι. τὰ μὲν ὧν οὐ δύνανται νήπιοι κόσμῳ φέρειν,*
> *ἀλλ' ἀγαθοί, τὰ καλὰ τρέψαντες ἔξω.*—Vv. 81-4.

And in the translation Hiero is reminded

> How for each blessing gods bestow They add a double share of woe;
> Fools may not brook its weight, but wise men find
> *The threatening cloud is silver-lined.*

Is there any warranty for the metaphor in the last of these lines? There is at least thus much, that, as Donaldson shows, it is a proverbial expression for "putting the brighter or fairer side outward," borrowed from *turning old clothes*. Therefore, putting the bright lining outside and dismissing from sight its dusky obverse may fairly be admitted as within the scope of the passage.

[illegible] of proverbial expressions, it is quite natural that we [illegible] and many such in [illegible] of them more or less akin

to modern adages, others illustrative of widespread Hellenic proverbs which have come down to us. In the Sixth Olympian Ode the victor, Agesias, son of Sostratus, is congratulated on his luck in the race of mule-cars on this wise:—

> ἵστω γὰρ ἐν τούτῳ πεδίλῳ δαιμόνιον πόδ' ἔχων
> Σωστράτου υἱός.
>
> Sostratus's son, thy feet around Such sandal fair hath fortune bound; (Morice)

or, as Mr. Myers renders it, "Let the son of Sostratus know that he has his lucky foot in this sandal." The Greek expression, *περὶ πόδα ἐστί*, as Donaldson showed, is equivalent to our saying "The cap fits"; but we also seem to detect in it the possible source of the common, and perhaps slang, expression, "You have put your foot in it," though it is used by us "in malam," not, as here, "in bonam partem." In the same ode, later on (89-90), Pindar adjures Æneas, the bearer of his ode to the Stymphalian chorus, to which he would have to explain and teach it, to make sure of escape from the "ancient reproach that spake truly of *Bœotian swine*" (*ἀρχαῖον ὄνειδος—Βοιωτίαν ὗν*). It has been said that this stigma took its shape from the resemblance of Bœotian wits to the dampness and thickness of their atmosphere; but one of our later historians of Greece refers it (as this passage renders it reasonable) to a constitutional sluggishness induced by the fertility of the country, which bred luxury.

One or two minor slips we should like to see amended in this translation. In Ol. iii. 1-2, *Τυνδαρίδαις—εὔχομαι*, it is not a wish, or prayer, or invocation, which the poet makes, but a confident assertion, as is clear if we consult Donaldson and Myers. In Ol. v. 3 we should be glad to see some readjustment of the verses—

> Deign a welcome to the gift
> Hither that the victor Psaumis sends thee for his mule-car swift-

which would bring out the curious feature in the original of the *car* being set before its *master* as the giver of the gift. In Ol. viii. 23 we can find no Greek to correspond with the somewhat obscure English, "So o'er no folk she reigns." But, as a set-off against these small fault-findings, we could string together, had we space, numberless felicitous renderings of Pindaric expressions which indicate Mr. Morice's possession of at least that boldness of fancy and poetic sense which are essential to the translation of so soaring a bard.

HUGH CRICHTON'S ROMANCE.*

WE have read more thrilling romances than Hugh Crichton's. Yet it must have come in as an exciting episode in the humdrum existence of an English banker who is a model of unattractive respectability. Not that the novel is by any means a dull one as novels go. Perhaps we need hardly say that it would have been all the more readable for being curtailed by a third, for that is the inevitable criticism on nineteen-twentieths of the fictions that drag their tedious length through the reviewer's hands. Yet its merits are something more than negative. It is perfectly pure and ladylike throughout; the grammar is unexceptionable, the style simple, and there is nothing in the way of expression or coarse sensationalism that could shock the most refined sensibility. Besides, it sets out a considerable variety of character, and shows an appreciative knowledge of picturesque foreign life. The chief defects, besides a certain prolixity, are a looseness of plot which causes people to turn up promiscuously, vanishing as suddenly as they appeared, before we have had time to discern their purpose or distinguish their features; and a violation of probabilities in straining the incidents which are to become the pivots of the action. And, on second thoughts, when we said there was no sensationalism in the book, we are reminded that we should have made a single exception. The happiness of a couple of lives is nearly wrecked permanently by the sacrifice of a third in most unnatural circumstances. There is a nice, taking little girl, Mysie Crofton by name, who has glided into an engagement with a cousin with whom she has been brought up. Their course of true love seems likely to carry them very comfortably into the tranquil haven of early matrimony. But it becomes indispensable that poor Mysie should be brought to an untimely end. So she is inexorably condemned, and the question is how to dispose of her so that the shadow of her death may fall upon Hugh Crichton as well as her betrothed. The author manages it in this wise. She sends Hugh and Arthur out rabbit-shooting in company. Hugh is out of temper for various reasons. After a succession of misses, he sees another rabbit before him and throws up his gun. Quicker even than the movement—and snap rabbit-shooting is quick work—Arthur shouts to him not to fire, lest he should frighten Mysie, for Mysie has been visible at some considerable distance standing on the bank of a canal by the brink of a lock. It must have been a prophetic inspiration of evil on the part of the lover, for nothing could have been more unlikely than the impending catastrophe. So the prosaic Hugh does just what most people would have done in the circumstances; he ejaculates "Nonsense," and knocks the rabbit over. But immediately on the sharp report—she seems to have paid no attention to the previous firing—Mysie drops with the rabbit, and falls headlong into the canal. The gentlemen of course are on the spot as fast as their legs can carry them there, and the remorseful Hugh is making plunges like an otter. He might have made sure of coming straight on the unhappy girl in the still water, but it is ordered otherwise. Somehow he ingeniously manages to miss her; there is nothing to be done but let the water drain off, and then, when at last she is landed on the bank, it is found that she has been spared the slow pain of drowning. She had been the unfortunate victim of a coincidence of fatalities; and how she should have struck her head on the stones, considering that she tumbled into deep water past the sheer sides of the lock, we confess ourselves utterly incapable of conceiving.

As for looseness of plot, the author is utterly indifferent to those unities of place to which the purists of an earlier age insisted on attending so rigidly. The story opens in Italy; in consequence of a lovers' misunderstanding, the hero, Hugh, returns to England, carrying with him and leaving behind him a bitter disappointment and melancholy heartaches. But the severed lives, with the attraction and repulsion of injured feelings, are never brought together again till very near the close of the volumes. For a time the little Italian household is almost suffered to slip from our recollection, and we are distracted in the meanwhile from the main excitement by subordinate interests which engross our attention, although it is only fair to say that these last are not without their bearings on the former. But the result is a gratuitous diffusion of our sympathies where it would need all the mechanical art of the writer to make us concentrate them on any one of her characters. We may add that she has either written her book in some ignorance of the weaknesses of society, or, as we think more probable, has chosen deliberately to try to elevate the tone of society by ostentatiously affecting to ignore its prejudices. Many schoolmistresses and governesses no doubt are ladies of better education, accomplishments, birth, and breeding than those who make use of their services. No doubt, in virtue of the responsibilities of their important charge, they ought to be treated with the utmost deference and consideration. Unfortunately, however, they seldom are so treated, and most people will confess to a faint sense of respectful repulsion towards ladies whose business it is to discipline a schoolful of buoyant girls by affecting the virtues of austerity, till these almost become a second nature to them. At all events we should regard it as something of a social phenomenon were we to light upon three maiden sisters, schoolmistresses, who mixed on the easiest terms with the golden youth of the best county society, and whose Christian names were familiarly taken in vain by eligible young gentlemen, the beaux of the neighbourhood. The author, however, tacitly assumes this to be the normal state of things; nor does she hint at worldly-wise parents deeming it anything of a *mésalliance* were flirtation to end in something more serious. In like manner the family of a well-to-do solicitor, who have a pseudo-fashionable set of acquaintances in South Kensington, are delighted to encourage the foreign cousins that they welcome in looking out for pupils or seeking situations as governesses; nor do they make any display of foolish prejudices as to the elder of the sisters trying her fortunes on the stage. We grant that it would have been snobbish had they behaved differently, and that the kindest thing they could do was to help a couple of penniless girls to get their living in a respectable way. But, as things are, and considering their circumstances on the borders of the gay world, it was sufficiently to their credit to act as they did for the author to have called her readers' attention to it.

These two Italian girls, English by the mother's side, are drawn with no little art and spirit. Both are fascinating in their different ways, but the characters are made to contrast with each other charmingly. Violante, the younger, is blessed with a voice that might be a gold mine, and has beauty and sweet manners to back it up with. Her father, a professional musician, has always destined her for triumphs in the opera; but his cherished ambition is doomed to disappointment. Violante's shrinking shyness mars everything; her nature is prosaic, and not at all dramatic, and even in rehearsing at home she acts execrably. Rosa, on the other hand, with a voice harsh as a peacock's, is a born actress, and so throws herself into her parts in trying to animate her sister that, were there only spectators, she would bring down the house. The scene between the two is very prettily given where Rosa is acting the impetuous Don Giovanni to Violante's awkward and embarrassed Zerlina:—

> It was a pretty scene in the hot, shady room; Rosa in her fantastic dress, her eyes bright, her face full of ardour, acting the part with a force and fervour that seemed marvellous to Violante; and the slender, delicate, white-robed girl, with her birdlike voice and natural grace that yet lent itself so imperfectly to the gestures and smiles she was trying to copy, so little inspired by the fictitious character and feeling that Don Giovanni's vehement and characteristic loving made her hang her head and blush, forgetful of the coquettish response intended.

We are sorry that the author should not have carried more of this graceful vigour of description into her scenes of English life. When we leave Italy and Violante's stage experiences for the quiet English town of Oxley, we decidedly lose by the change. Perhaps the home pictures are only too realistic; for though the people are good-looking, healthy, and cheery, with the exception of the gentlemen whose lives were blighted on the canal bank, they are on the whole insipid and very commonplace. Of course it is Violante who is at the bottom of Hugh Crichton's romance. It would sound like a shock and a scandal to the whole neighbourhood that a staid banker, the very incarnation of business qualities and tame

* *Hugh Crichton's Romance.* By the Author of "Lady Betty," &c. Macmillan & Co. 1875.

propriety, should bring this impulsive young opera singer home to his hearth at the Bank House. Yet it is clear from the first that his romance must have a happy ending somehow, and that the game of cross purposes which parts the lovers for so long can only come to one inevitable conclusion. In the meantime, and as the story draws leisurely towards its end, the introduction of the sweet but fantastic young Italian as pupil-teacher throws some picturesque light into the dull interior of the Miss Vennings' seminary. But in making one of her leading couples happy the author seems to think she has done enough. The survivor of the parallel love affair which ended so prematurely in the canal never attains to the fruition of the consolation which we are all along led to believe is in store for him. He is a good-natured fellow, though somewhat mawkish; just the sort of man to piece up his broken life if some congenial and sympathetic heart were brought in contact with his own. And one of the fair spinsters of the school is only too willing to play the part of ministering angel. Her frank manners betray what we can scarcely call her secret; her fine blue eyes fill with tears as Arthur breathes into her sympathetic ears half-resigned lamentations over his melancholy lot. Schoolmistress as she is, and although somewhat muscularly made, Florry Venning is a captivating girl; and if the aunt of the lorn lover, who has stood in the place of a mother to him, offers apparently no objection to this union, we should be only too glad to see the young lady made happy, as she longs to be. But the author at the last moment decides otherwise, and, after leading us fully to expect a final proposal, she closes her tale with startling abruptness, and sentences Arthur Crichton to solitary transportation in India. That we felt the decision to be a disappointment and a mistake is a proof that our imagination had been wrought upon by successful treatment; and indeed we have read the story with more than average interest, although here and there the attention would flag notwithstanding our conscientious efforts to steady it.

GERMAN LITERATURE.

PHŒNICIA * differs from most regions of special archæological interest in the comparative penury of its relics of the remote past and in the compensating richness of more recent periods, and the general vitality of its actual existence. While Tyre and Sidon have vanished far more completely than Memphis and Nineveh, while even the later Roman period has left few traces of itself, on the other hand the recollections of the Crusading and Venetian epochs are comparatively fresh, the slopes of the Lebanon are a scene of busy industry, and Beyrout, the heir of the old Phœnician marts, is passing through one of the most prosperous phases of its chequered history. It follows that any comprehensive account of Phœnicia on a large scale is likely to be a medley; the writer cannot omit the specifically Phœnician part of his subject; but, from sheer poverty of material, is compelled to eke it out with a variety of extraneous matter. Dr. Prutz's work is not wholly exempt from the suspicion of book-making, and hardly corresponds to the expectations aroused by the title; yet we can scarcely quarrel with him for giving us more than we anticipated instead of less. The value of his work as a contribution to Phœnician archæology is almost wholly comprised in the chapter on ancient Tyre, and even this is little more than a compilation from the researches of others. The most important part of it is a dissertation on the geological changes which, by affecting the sea-level, and aided by the mole constructed by Alexander the Great, have gradually submerged a portion of the ancient city, filled the original harbours, and converted the two islands into one. It is illustrated by plans indicating the theories which have been broached upon the subject. Dr. Prutz seems not to possess the specially Semitic erudition necessary to constitute him an authority on the life and polity of Phœnician Tyre; and, in fact, little can be added to the researches of Mövers and Kenrick until the great enterprise here suggested shall be carried out, the mole restored, the sea drained away from the submerged city, and the recovered site carefully excavated. Dr. Prutz's description of Baalbec is exceedingly enthusiastic. The city, he thinks, is adapted by nature to be the capital of Syria, and would become so under a judicious administration. A chapter on Beyrout describes the present condition of this chief port of Syria as extremely flourishing, and as the seat of a highly important European community, the German element in which is becoming considerable. The most original of Dr. Prutz's contributions to our knowledge are perhaps his chapters on the history of Tyre under the Crusaders, and on the Venetian community established there. The latter contains much curious antiquarian information, as does a disquisition on the Venetian church of St. Mark in the city.

The veteran Von Ranke has judiciously abstained from entitling his work on the Seven Years' War † a history of the eventful conflict. It is properly described by him as a contribution to the history of the period—an historical essay, in fact, occupied with the causes and consequences of the struggle rather than with its actual incidents, and based to a considerable extent upon recent researches in the Austrian archives. The effect of these may not have been materially to modify accepted views respecting the rights and wrongs of the war; but they tend to bring into clearer light its influence on the European political system—the approximation of ancient rivals, the formation of new ties, the introduction of fresh members into the international concert; above all, the preparation for American independence by the destruction of the French colonial power against which the English colonists had hitherto needed protection. Perhaps the most generally interesting part of the book is a memoir by Chancellor Fürst, Prussian agent at the Court of Vienna immediately before the outbreak of the war, in which the characters of Maria Theresa and her Ministers, and of the Austrian administration in general, are sketched in a very lively style.

Francisca von Hohenheim * was for many years the mistress, and eventually the duchess, of Carl Duke of Wurtemberg, celebrated in connexion with Schiller. She appears to have been an amiable and, notwithstanding her ambiguous situation, pious woman, whose beneficial influence on her partner probably contributed to that reformation of conduct which regained for him the affections of his subjects. These particulars are set forth at great, and indeed tedious, length by her admiring biographer, who takes care to represent her original and forsaken husband in the most unfavourable light. He may have deserved all the harm said of him; but it is no especial breach of charity to surmise that, had he been an angel, things would nevertheless have taken much the same course. Duke Charles was certainly much above the average level of the German princes of his day. Some remarks of his on the state of France, written in 1788 after a visit to the country, show remarkable sagacity. "France," he says, "is at the last gasp, and the most drastic remedies seem entirely in vain. The King is more than weak; the Queen addicted to every kind of dissipation, and justly odious to the people; commerce, agriculture, credit, all are prostrate. The States-General are to be convoked; but to what end where there is no fidelity or confidence, and none are really in earnest? Instructor Time, what art thou about to reveal?"

Colonel Leer's treatise on strategy, † translated from the Russian, appears to be precise and lucid. It is divided into two sections, treating respectively of offensive and defensive war, and both illustrated by examples from the most celebrated campaigns. It is prefaced by a review of previous strategical literature since the appearance of General Lloyd's critical history of the Seven Years' War.

The second volume of Radenhausen's *Osiris* ‡ may, like the first, be described as a physical history of the universe, with few pretensions on the score of originality, but admirable as a lucid and pregnant condensation of the most generally accepted results of scientific inquiry. This character applies more particularly to the first volume, which treats of inorganic nature; the problems of biological development, discussed in the second, affording more scope for controversy. In general, however, Herr Radenhausen's representation of the cosmical process may be accepted as fairly corresponding to the present condition of knowledge, even by those most disposed to regard his materialism as merely the groundwork of fact from which it yet remains to educe a truly philological cosmogony.

Dr. Volkelt §, known as the critic of Hartmann and Schopenhauer, has published an interesting monograph on dreams, partly founded on Schemer's work on this subject. In Scherner's view the visions beheld in dreams are chiefly repetitions of the dreamer's contemporaneous physical sensations in an idealized shape. Of this he gives numerous instances, to which Dr. Volkelt adds sundry others from his own experience. He pleads guilty, for example, to having on one occasion exceeded in beer, and shows how the resulting physical sensation was translated in sleep into a number of symbols devoid of all apparent connexion with the cause of the indisposition, but all capable of being resolved into the feeling of listless drowsiness. Such observations open up an interesting and obscure chapter in psychology. Dr. Volkelt's own theory is that of Hegel, who terms every dream a microcosm, and regards the production of a rudimentary degree of consciousness out of a state of slumber as an image in miniature of the passage of Not Being into Being, so much insisted on in his philosophy.

Herr Byk ‖ has written a very interesting volume on the pre-Socratic philosophy of Greece. The first volume treats of the philosophers upon whom he bestows the appellation of Dualists, including all the most eminent names except Democritus, Heraclitus, and the Eleatic school. The fitness of the designation is scarcely apparent, as by Herr Byk's own definition these thinkers were all engaged in the quest of an absolute unity, and it is only

in virtue of their efforts in this direction that they are entitled to rank as philosophers at all. With him, as with most others, Thales ranks as the founder of Hellenic philosophy, the first who attempted to reduce the multitude of natural phenomena, and of their personifications in the popular mythology, to substantial unity as manifestations of a single principle. He admits having frequently taken considerable liberties with the philosophers whose opinions he describes, and having availed himself of the dangerous privilege of reconstruction by divination to a degree only justifiable by the fragmentary condition of the primitive texts. On the other hand, his quotations are exceedingly numerous, although the majority are necessarily derived from late and second-hand authorities, such as Plutarch and Diogenes Laertius. It may further be pleaded in his excuse that the object of his work is not so much to state the opinions of individuals as to exhibit the progress of philosophic thought as a consecutive movement.

Paul Scheffer-Boichorst returns to the charge against the authenticity of the chronicle of Dino Compagni *, and, after a full examination of the grounds alleged in its defence by Professor Hegel, reiterates his conviction of its being a forgery.

F. Becker, in an ingenious essay on the supposed caricature of the Crucifixion † discovered among the ruins of an Imperial palace at Rome, ascribes the sketch to the age of Septimius Severus, and contests Garrucci's opinion that the idea of it was derived from an actual crucifix. He seems unacquainted with the opinion of Mr. King and other English archæologists that the caricature has no reference to the Crucifixion.

Herman Grimm's ‡ fifteen essays on literary and artistic subjects are for the most part but slight affairs, and scarcely worth the trouble of collecting, though all are distinguished by the writer's characteristic elegance of treatment. In one or two instances the interest of the subject redeems the slightness of the execution, especially in the case of the essay devoted to the powerful and eccentric Belgian painter, Antoine Wiertz, a man of truly original genius, who presented himself to the world as the rival or successor of Rubens, but will probably be ranked by posterity as intermediate between Kaulbach and Fuseli. Herr Grimm is too much under the influence of academical convention to be altogether just to so daring, and in some respects grotesque, an innovator in all things conventional and academical. The most elaborate of the literary essays is an analysis of the character of Hamlet, arriving at the conclusion that it is "an incarnate contradiction," and must consequently always remain more or less enigmatical. A review of the life and works of Cornelius, which concludes the volume, is of more compass and authority than anything else in it, and might have been advantageously published as a separate work. It includes several interesting notes of interviews with Cornelius, mostly with a bearing upon the mortifications he underwent in his latter years.

Eleven enormous volumes have at last brought Herr Klein's general history of the drama to the history of the drama of England§, which, if continued upon the scale of the first volume devoted to it, may probably be completed in about eleven more. Herr Klein has not yet got beyond the early miracle plays, to which about a hundred and twenty pages are devoted out of a volume of 750. The remainder are occupied with the ancient Celts, the Roman and Saxon conquests of Britain, the lays of the Welsh bards, Ossian, Chaucer, Robin Hood, anything and everything except the English drama; the whole intermixed with grotesque sallies against Immanuel Kant and other persons and things equally germane to the matter. It would be hard to find a more signal instance of the misapplication of industry, erudition, and literary ardour.

A little volume of musical criticisms, published under the name of La Mara ‖, will be found useful as a compendious sketch of the most popular representatives, Wagner excepted, of the prevalent schools of German music. Rubinstein, Franz, and Brahms may especially be cited as composers who have attained such a position as to have created a genuine demand for accurate information respecting their principal pieces. This the writer supplies with evident fairness and painstaking, and his criticism, though technical, is in no respect abstruse. The value of the book is greatly enhanced by the catalogues it contains of the composers' principal works.

The name of C. F. Pohl ¶ is a guarantee for good work in the department of musical criticism. His carefully written biography of Haydn, however, has not as yet advanced beyond the composer's reception into the family of Prince Esterhazy, at which period he had indeed acquired a reputation, but his great works were yet to come. Haydn's life is at best uneventful, and the general placidity of the narrative is enhanced by the minute investigation which his biographer has bestowed upon points in themselves of no great moment, but which could not be neglected without destruction to the entire texture of the narrative which they collectively constitute. A work written on this plan must, indeed, be unattractive to general readers, but finds its justification in the needs of the exclusively musical public, whose interest in Haydn requires more substantial satisfaction than the knowledge that he was a singularly amiable man of retiring habits, with the kindest of patrons and the unkindest of wives.

Anton Springer's investigation of the circumstances attending Michel Angelo's residence in Rome from 1508 to 1512 * is mainly based upon the information recently brought to light by the edition of the artist's letters by Milanesi and his Life by Gotti. It is a clear and interesting monograph.

Herr Karl Fulda † can of course tell us little of novelty respecting Shakspeare's life, but his notices of the degree in which subsequent poets and artists have been indebted to the great dramatist, if not precisely new, are yet acceptable from the clearness and neatness with which they are grouped together.

A tragedy on the history of Savonarola ‡, by Ernst Koppel, shows good intentions, but the writer's powers are not yet adequate to the subject. It is indeed questionable whether the story of Savonarola is as well adapted for dramatic treatment as Lenau has shown it to be for epical. Herr Koppel, at all events, has not succeeded in breathing life into his personages; their declamation is irreproachable, but they are almost as entirely representatives of conventional types as are the heroes of the quaint puppet-plays edited by C. Engel. § The fourth part of this series contains "Geneviève," "Jack Pudding as Exorcist," and "Almanda."

The January number of the *Rundschau* ‖ has a pretty novelette by E. Wichert; the conclusion of Herr Raaslöff's paper on the constitutional crisis in Denmark, which seems likely to terminate in a *coup d'état*; a long and laboured apology for Goethe's bigamous Stella, with some interesting references to its possible connexion with the family circumstances of Jacobi; and a valuable communication from the naturalist Anton Dohrn, respecting the aquarium established by him for scientific purposes at Naples.

THE SLAVE CIRCULAR DEBATE.

THE debate on the Slave Circular or Circulars has had the advantage of clearing up many points as to which it was desirable that public opinion should be enlightened. It was, in the first place, calculated to put in a clear way the distinction between the question how slaves taken on board vessels seized for carrying on the slave-trade are to be treated, and the question how slaves escaping from a country where slavery is legal are to be treated. The distinction seems obvious; but it was one that had evidently failed to catch the attention of many members of the House of Commons, who, in discussing Mr. WHITBREAD'S motion, persisted in referring to the Act of 1873. This Act had nothing to do with the treatment of fugitive slaves, but dealt only with slaves found on board vessels seized for carrying on the slave-trade. In the next place, the discussion showed what had been the mainspring of the difficulties that had practically arisen. The general belief of commanders of men-of-war has been that fugitive slaves coming on board their vessels, wherever those vessels might be, gained a status of liberty by the mere fact of their being there, and that it was the business of naval commanders to see that the fugitives did not lose the advantage they thus obtained. The general doctrine of the Foreign Office has been, on the other hand, that slaves escaping to British men-of-war lying in foreign ports ought to be given back to their owners. There can be no question that this was the doctrine of the Foreign Office which Lord DERBY found to be established when he was asked to give instructions. Lord CLARENDON had laid down this doctrine in the clearest language, had censured a naval commander for not having acted on it, and had actually apologized to a slave-holding Power for an infraction of the rule. Lord GRANVILLE had sent out instructions to commanders on the East Indies station that slaves escaping to British men-of-war within territorial limits should be returned to their owners. It is clear to every one not bewildered by party spirit that if, when asked for new instructions, Lord DERBY had simply said that he had nothing to add to the doctrines of Lord CLARENDON and Lord GRANVILLE, by which he felt himself bound, we should either have heard nothing of the new-born British disgust at this doctrine, or the disgust must have taken the form of a vehement disapproval of the pernicious doctrines of Liberal Foreign Secretaries, and an appeal to Lord DERBY to take courage and wash his hands clean of the Liberal pitch by which they had been defiled. Unfortunately for himself and his party, Lord DERBY, instead of doing this, issued the First Circular, and the ATTORNEY-GENERAL in the course of the debate explained how it happened that the First Circular assumed its very peculiar shape, and what were the doctrines on which it was based.

The view of the ATTORNEY-GENERAL was that fugitive slaves were breakers of the law of their country, and that it was the duty of England to help foreign authorities to see their laws upheld. He recognized no right in England to question the validity of local laws. It was enough that the law existed. In pursuance of this doctrine, he saw no difference as to the place where the fugitive might happen to be received. The English man-of-war might be in a foreign harbour or on the open sea; it was equally the duty of England to treat a law-breaker as a criminal and to help foreign law to take effect. So far as fugitive slaves were concerned, the question of the extra-territorial character of men-of-war did not in the eyes of the ATTORNEY-GENERAL arise at all. Whatever might be the abstract rights of the English commander, his duty was to further the course of foreign law. This doctrine may now be said to be exploded. No one except the ATTORNEY-GENERAL maintained it in debate. It was abandoned under the advice of the CHANCELLOR in the Second Circular, and it was a new doctrine not sanctioned by the precedents of former Governments. The main question was left—whether the standing doctrine of the Foreign Office, that fugitive slaves received within territorial limits are to be given up, is to be upheld? This, again, resolves itself into two questions:—Are we bound to surrender slaves received on board our men-of-war under such circumstances? and, Is it practically wise to surrender them even if we are not bound? The debate has made it clear that we are not bound to surrender the slaves. The Second Circular was framed by Lord CAIRNS in accordance with this view. It expressly directs commanders not to entertain any demand for surrender. But even members of the Cabinet were not clear on the point, and had not realized to themselves what is meant by the extra-territorial character of a man-of-war. They were puzzled by a man-of-war having to submit to Customs and Quarantine regulations. The distinction, however, is simple enough when pointed out. The man-of-war must abide by the rules of the port, regulating how it shall come in, where it shall lie, how it shall communicate with the shore, and so forth; but as to all that happens within its own limits, it is out of the foreign jurisdiction altogether. If a political refugee, or a murderer, or a fugitive slave, gets on board, it is entirely a matter for the commander to decide whether he will give his unwelcome guest up or not. Most persons would say that he ought not to give up a political refugee, and that he ought to give up a murderer; while as to fugitive slaves, commanders fancied they ought not to give them up, and the Foreign Office, although with some wavering of opinion, has still, on the whole, and especially in recent years, thought they ought to give them up.

The arguments for giving the slave up, and for not giving him up, are both drawn from the consideration of what is best for slaves generally. On the one hand, it is said that it is best to give him up because we can only attack slavery effectually with the good will of the countries where it exists, or by getting them to concur with us in the measures which we think for the time the most necessary and indispensable. Speaking broadly, it may be said that we have thrown all our energies into suppressing the slave-trade, and have left domestic slavery undisturbed. We could not attack domestic slavery if we wished to induce or press foreign nations into allowing us to put down the slave-trade. As we obtained the treaties by which the slave-trade was suppressed on the faith of our declaration that we would not interfere with domestic slavery, we ought, it is said, to abide by our word. On the other hand, it is urged that the time for a new departure is now come. We have put down, or nearly put down, the slave-trade, and it is time to mark our abhorrence of domestic slavery. This we may do if we keep on board our vessels fugitives who have broken laws, who have broken laws which we proclaim are wicked and ought not to exist anywhere. This was the line of the Liberal speakers in the debate. As they could not deny that the old policy of Liberal Foreign Secretaries was just as bad as that of Lord DERBY, they proposed that there should be something new done for the slave. The difficulty

in which Conservatives were placed was that the Cabinet could not make up its mind whether it should sanction this new departure or not. The Second Circular was studiously framed so as to avoid the question. The captain is, under its provisions, not to give the slave up, but he is not to permit him to remain on board. The slave is to be put on shore, but only as a superfluous passenger, not as a slave. This is a most curious direction to give to a captain when the Government pleads that it must give definite instructions or it would not be doing its duty. England is not to give the slave back to the owner, but is to put him where the owner can conveniently catch him. As more than one Liberal speaker truly prophesied, the debate must kill the Second Circular. The real question, having been raised, must be settled. Is the standing policy of the Foreign Office to be maintained, or shall there be a new policy? The Ministry plainly replies that it cannot say; but it hopes that seven or eight clever people may tell them. A more utter abdication of responsibility could not be conceived. As Mr. DISRAELI admitted, the Commissioners have nothing but a great question of State policy to take under their consideration. There is no law, there are no treaties to be examined. The question is whether England, having suppressed the slave-trade, shall now take up a position towards domestic slavery different from that which it has hitherto assumed, in the hope of affecting the opinion of the world, and with the risk of complications which may lead to bitter differences and possibly to war. The answer of the Cabinet to the question is that they have not the remotest notion themselves what way to answer it, but that they think they know some gentlemen, with more or less of legal minds, who could answer it for them. It is perhaps the poorest answer a Cabinet ever gave.

SPAIN.

WHEN the young King of SPAIN formally assumed command of the army, it was reasonably inferred that his advisers were confident of early and immediate success. It seems that all the generals in command have both acted loyally together in the accomplishment of a general design and shown praiseworthy vigour in their separate operations. The movement by which MARTINEZ CAMPOS cut off the enemy's communications with the frontier would perhaps not have been practicable if the French Government had, as in former times, favoured the Carlist cause. For some time past Marshal MACMAHON and his Ministers have given every facility to the Alfonsists, although supplies seem to have been drawn by both parties from France. The checks which were incurred by MORIONES and LOMA had no permanent effect on the fortunes of the campaign; but complete success was not assured until PRIMO DE RIVERA, after occupying the neighbouring heights, at last took the central stronghold of Estella. The KING, accompanied by General QUESADA, has since entered Tolosa, which was the capital, as Estella may be considered the citadel, of the territory of Don CARLOS. The Carlists have in the final struggle retained the credit which belongs to obstinate courage in encountering superior forces; but they were surrounded on all sides by the Alfonsist armies, and probably they had been compelled to weaken the garrison of Estella. Even the supporters of the defeated cause may now be reasonably anxious that further resistance should cease. When all hope is over, it is a crime as well as a folly to cause further bloodshed. The rumour that Don CARLOS has been advised by the Vatican to retire from the struggle is not incredible. A year ago his pretensions enabled the NUNCIO to demand from the Ministers at Madrid large concessions in exchange for Papal recognition. For some time past no hopes of direct advantage could be founded on the prospects of the Pretender; and now he has become unserviceable even for purposes of menace. The opinions and character of Don CARLOS would have insured the confidence of the Holy See if his chances of success had at any time been considerable. Almost alone among princes and pretenders, he openly avowed unlimited devotion to the Church and uncompromising hostility to modern constitutional doctrines. Nevertheless he became by a strange accident the champion of ancient franchises which were threatened by tendencies of centralization.

No sufficient account has been made public of the resources by which war has been maintained for two years. The hardy provinces of the North have supplied soldiers of the best quality in Spain; and the natural strength of the country has enabled smaller numbers to maintain a defensive attitude with success. Don CARLOS has a large fortune, and he is supposed to have received pecuniary aid from the late Duke of MODENA; but war is too costly an undertaking to be in ordinary cases maintained out of private means. A small revenue was raised by Customs duties on the part of the frontier which was in possession of the Carlists, and the provinces made occasional contributions of money as well as of men. The time of the original rising was well chosen, when successive revolutions, which soon afterwards resulted in the establishment of an anarchical Republic, had reduced Spain to the lowest point of degradation. The spirited Italian prince who occupied the throne at the beginning of the civil war was unpopular as a foreigner; and it seemed possible that a legitimate Spanish Pretender might be preferred by the nation at large. The abdication of AMADEO was immediately followed by the rebellion of Carthagena, which for some months furnished occupation for the remnant of the Spanish army. It was only after the partial restoration of order under SERRANO that the Central Government was at leisure to attend to the Carlist rebellion. The success of SERRANO and CONCHA at Somorrostro was immediately followed by the ruinous disaster of Estella, and by the death of the only general who at that time commanded the confidence of the army; yet in the lowest ebb of the national fortunes it became evident that the Carlists must ultimately fail. The Pretender, while he was for the time secure in his mountain fastnesses, found no adherents in any other part of the country; nor, when the Government of Madrid was weakest, did his generals venture to operate in the low country or to march on Madrid. As in the similar case of the American Civil War, greater numbers and larger material resources were certain to prevail in the end. The insurrection itself condemned the theories of the demagogues who had almost destroyed the army; and the Governments of SERRANO and of King ALFONSO steadily devoted themselves to the task of recruiting and of restoring discipline. When there was again a Spanish army of 200,000 men, the days of the rebellion were numbered.

In consequence of the smallness of the area of the struggle, the war has not, except through the demand for recruits, interfered with prosperity in the greater part of Spain. It has also allowed the restored dynasty a breathing time, while party conflicts and military conspiracies were suspended. The chief practical inconvenience which has been felt consists in the diversion which has been effected in favour of the insurgents in Cuba, and in the consequent risk of aggression on the part of the United States. The termination of the war in the North will leave a large force available for colonial service; and it may probably not be inconvenient to provide occupation for some of the generals who have by their recent services established claims to occupation and reward. The Government must be prepared for the early revival of political agitation. Although a dictatorship exercised in the name of the KING might be tolerated during the continuance of the war, it is not to be supposed that parties which have been not long since powerful or supreme will acquiesce in permanent exclusion from all share in public affairs. The unmanageable character of universal suffrage may perhaps render a certain interference with elections necessary in Spain. The uniform practice of all parties, as they have successively occupied office, seems to prove that it is impossible to rely on a perverse constitutional system; yet it is difficult to believe that it can be prudent to return Ministerial majorities which are absurdly and scandalously unanimous. There are either three or four political parties in Spain, as the Liberal Unionists are considered a part of the same body with the Progressists or are regarded as a distinct combination. The two sections include nearly all the intelligence and political experience of the country. At one extreme are the Moderates, including the friends of absolutism and Ultramontanism; and the Republicans, who three years ago themselves excluded all other parties from the Cortes, cannot have become wholly extinct. The followers of SAGASTA were not long since regarded as a reactionary party, while ZORRILLA and his adherents were the more Liberal supporters of constitutional monarchy. By a curious change of circumstances, SAGASTA, though he is not known to have changed his opinions, is now the leader of the most advanced section of the Opposition.

The present Cortes has been too ostentatiously packed. The only Republican admitted is CASTELAR, whose eloquence is probably regarded as innocuous while he stands absolutely alone. Thirty-five supporters of SAGASTA will represent the Liberal opinion of Spain in the absence of ZORRILLA and of the entire Progressist party. It is perhaps immaterial that the Senate, which exercises little political power, is almost entirely composed of Moderates inclined to extreme courses on ecclesiastical and civil affairs. The same party is strong in the Congress or Lower House, and it probably includes many members of the body which professes uncompromising devotion to the Ministers. The less illiberal section of the Government retired when JOVELLAR was removed from the management of affairs to the command in Cuba. The chief Minister has not hitherto been regarded as a bigot in religion or politics; but it is not forgotten that a year ago he assented to the revival of an extravagant Concordat; and his management of the elections indicates a disposition to rely on the support of the Moderates. He may probably find himself embarrassed by the readiness of the Cortes to concede ecclesiastical claims which are profoundly distasteful to the community. King ALFONSO will have at the best many difficulties to encounter; but the greatest dangers which he could incur would result from his allying himself with the restless portion of the priesthood. The reported determination of Queen ISABELLA to return to Spain as soon as the civil war is ended bodes ill for the fortunes of her son. Her personal conduct when she was on the throne might possibly have been overlooked or condoned if she had not become the instrument of the zealous partisans of Rome. She would probably not return to Spain unless she believed herself to possess great influence over her son; and a general conviction that the KING was guided by her counsels would be fatal to his reputation and authority. Political discontent in Spain is the more formidable because every party which may be out of power can command the services of some discontented military chief. The two generals who restored the Monarchy have since done good service in the field, and they and their rivals will not fail to prefer claims which it may be difficult for the Government to satisfy. The report that MARTINEZ CAMPOS has zealously supported the QUEEN'S return indicates, if it be true, the existence of a dangerous military element in Spanish politics.

THE SUEZ CANAL DEBATE.

MR. LOWE had some reason for saying that Messrs. ROTHSCHILD incurred little risk when they advanced a large sum on the promise of the Government to recommend to the House of Commons the repayment of the amount. He might have followed up the same line of thought by admitting that the leaders of Opposition were much at their ease in minutely criticizing the proceedings of the Ministry without venturing to propose an adverse vote. It is true that a division could not be conveniently taken on any amendment which would have tended to defeat the Resolution moved by the CHANCELLOR of the EXCHEQUER; but, if Mr. GLADSTONE and Mr. LOWE could have reckoned on the support of their own party, they might have first assented to the vote and then moved a Resolution of censure on the policy of the Government. The prudence of the course which they adopted was sufficiently proved by the speech of the official head of the party. Lord HARTINGTON, with a statesmanlike perception of the real point at issue, plainly indicated his approval of the purchase, although he repeated the expression of his opinion that the shares might have been bought cheaper. The speeches of Mr. LOWE and Mr. GLADSTONE would perhaps have been more effective if they had been separated in the debate by a wider interval. Mr. DISRAELI might be charged with a want of tactical skill in allowing a private member of Parliament to answer Mr. LOWE, and immediately to precede Mr. GLADSTONE. Sir H. WOLFF'S undoubted ability and his general knowledge of the subject scarcely compensated for his necessarily imperfect acquaintance with the objects and motives of the Government. He professed his inability to answer Mr. LOWE'S remarks on the arrangement made with Messrs. ROTHSCHILD, and he inaccurately assumed that the PRIME MINISTER or the CHANCELLOR of the EXCHEQUER was practically responsible for the statements and arguments of the newspaper press. It seems to have been settled that no Minister, except the two who were immediately responsible, should take part in the debate; and Sir S. NORTHCOTE naturally reserved himself for the opportunity of answering Mr. GLADSTONE. As it happened, the case of the Government was strengthened by the full and early development of the plan of attack. The House was satisfied, before the Ministerial explanations began, that the opponents of the purchase had exhausted their grounds of objection while they had barely touched the fringe and outline of the case. Those who may perhaps have thought that the commission paid to Messrs. ROTHSCHILD was too high nevertheless retained the conviction that it was for the interest of England to hold a large share of the property of the Canal. Mr. DISRAELI expressed the feeling of the House when he said that the most obvious conclusion from the arguments of the ex-Ministers was that, if Mr. GLADSTONE had been in office, the purchase would never have been made. The further inference that a timid policy would have been a mistake was tacitly drawn on both sides of the House.

Mr. LOWE, not for the first time in the present Session, failed to apprehend the feeling of his audience; and Mr. GLADSTONE, by dwelling on the same points of secondary importance, confirmed the unfavourable impression which had been produced by his colleague. Mr. DISRAELI and Sir STAFFORD NORTHCOTE showed that it would have been impracticable to rely in the first instance on the aid of the Bank of England, although perhaps a part of the purchase money might have been obtained on easier terms after the secret had been disclosed. The terms of the advance were not disadvantageous to the lenders; but the number of capitalists who can produce 4,000,000*l.* at short notice must be limited, and the absence of competition tends to raise the price of all commodities, including money. Mr. LOWE was not happy in his reference to the *Alabama* payment, which he effected by an arrangement with the Bank of England. The debt, and the necessity for raising the money, had been approved by Parliament; and the CHANCELLOR of the EXCHEQUER was consequently, to the knowledge of the Bank, discharging an official duty, and not engaging in an unusual and unauthorized enterprise. It was highly characteristic of Mr. LOWE to contrast the most painful and mortifying of modern transactions with the popular measure which he undertook to depreciate. Mr. GLADSTONE made a serious imputation on the character of Messrs. ROTHSCHILD in his unfounded suggestion that their clerks had committed a breach of trust for stock-jobbing purposes. The principles of a great firm, when they engage in a confidential transaction of the highest importance, are responsible not only for themselves, but for all persons in their employment who may be in the secret of the business. There is no reason to suppose that Messrs. ROTHSCHILD admitted any clerk into their confidence; and they would scarcely maintain their commercial and financial position if their agents were in the habit of betraying any information which they may receive. The CHANCELLOR of the EXCHEQUER afterwards stated that the bargain was made public at Cairo, and that the news was, as might be expected, immediately transmitted by telegraph to London.

Mr. LOWE'S tedious and paradoxical demonstration of the ignorance of the Ministers as to the condition of the Canal Company was perhaps ironical. He can scarcely have intended seriously to dispute Sir S. NORTHCOTE'S assertion that he knew all the details of the subject, and that he had communicated the material points to the Cabinet. Both Mr. LOWE and Mr. GLADSTONE contended that Lord DERBY must have reckoned on the possession of more than ten votes when, in a conversation with the French Ambassador, he disclaimed any desire to exercise a preponderating influence in the management of the Canal. There is not much use in an ingenious argument which proves that a cautious and intelligent Minister has, with a full sense of responsibility, talked nonsense on a serious question. Mr. LOWE had probably no doubt that Lord DERBY knew all about the ten votes, and that he nevertheless bought the KHEDIVE'S shares for the purpose of acquiring influence. Lord DERBY himself declared that the denial of the obvious consequences was as absurd as a doubt whether two and two make four. It has not been sufficiently noticed either by the supporters or by the opponents of the purchase that the whole controversy on the right of voting turns on an immaterial issue. The votes are given at general meetings of the shareholders, while the administration is vested nominally

in a Council of Administration, and practically in a small Managing Committee, or rather in the President. The only real power of the shareholders consists in their right to elect at intervals of eight years the members of the Council of Administration. The Managing Committee is "specially appointed," probably by M. DE LESSEPS in the name of the Administrative Council. When the President a year or two ago threatened to close the Canal, he probably consulted neither the Administrative Council nor the Managing Committee; and he would have been neither entitled nor inclined to lay the matter before a general meeting of shareholders. It therefore matters little whether the English Government will have ten votes; nor is there any ground for Mr. GLADSTONE's anxiety about the jurisdiction of French tribunals. It will not be worth while to contest the point if M. DE LESSEPS should unwisely attempt to interfere with the legitimate influence of England. Mr. GLADSTONE's objections to Mr. CAVE's mission were still more irrelevant than his disquisition on the right of voting; and his case against the Government was not strengthened by a proof that he is an irreconcilable opponent. It is easy to say that the KHEDIVE's request for financial assistance ought to have been answered by a mission of two young clerks. If the course which Mr. GLADSTONE recommends had been adopted, he would have reproached the Ministers with equal vigour for not sending some agent such as Mr. CAVE to ascertain what the KHEDIVE really wanted. In trifling details it is idle to question the discretion of the Government, which must decide with the knowledge that any possible decision is open to hostile criticism.

The rumour that Mr. CAVE and M. DE LESSEPS have come to an understanding about tolls requires explanation. The English Government could not, without special authority from all the maritime States, agree to an increase of the charges on shipping. The assent, indeed, of Russia and France might be taken for granted; but Austria, Italy, Holland, Denmark, and other nations have strenuously supported English resistance to M. DE LESSEPS's audacious exactions. Mr. LOWE took no notice of the tedious and dangerous disputes which are recorded in the published French and English Correspondence. For four years past M. DE LESSEPS has furnished the French and English Governments with a subject of discussion which, in the days of the Empire, or in the time of M. THIERS, might easily have expanded into a serious quarrel. Mr. GLADSTONE, though he has probably read the Correspondence, carelessly asserts, both in his speech and in the paper of queries which he has since forwarded to the newspapers, that the result is highly satisfactory, although the French Government, aided by Russia, has steadily supported all the demands of M. DE LESSEPS. According to Mr. GLADSTONE, all maritime States allowed themselves to be represented by England, and they will withdraw their confidence when they find that the Government is interested in the capital of the Canal as well as in its trade. Unluckily for his argument, Germany, Italy, and other principal States have already expressed their cordial approval of the purchase. Lord PALMERSTON's objections to the project of the Canal were not conclusive; but they are improperly described by Mr. ROEBUCK as a craze. He has thus far been justified by the result in the calculation that the undertaking would be commercially unprofitable, for he could not foresee that the KHEDIVE would be induced by cajolery or force to provide more than one-half of the cost, while all the profits accrued to the shareholders. Whether, in case of war, the Canal would give an advantage to France over England is a question not yet tested by experience, and Mr. DISRAELI wisely declines a challenge to discuss it. In time of peace the controversy on the tolls has brought France and England into antagonism; and the purchase of shares will materially affect the merits of the dispute if it is hereafter revived. French Ministers and Ambassadors have avowed themselves the champions of shareholders against shipowners; and the English Government will in future negotiations [illegible] both capacities. The arguments of the two chief opponents of the Government were based on demurrer. Even if Mr. GLADSTONE and Mr. LOWE had proved all the propositions which they enunciated, acquiescence in their reasoning would be perfectly consistent with approval of the purchase as a patriotic and prudent transaction.

M. BUFFET'S COLLAPSE.

WHEN the relative merits of the *scrutin de liste* and the *scrutin d'arrondissement* were under discussion in the French Assembly M. GAMBETTA hazarded what at the time appeared to many people a very rash prediction. He told the advocates of the *scrutin d'arrondissement* that though, as a matter of principle, he was opposed to them, he had no fear that their success would do the Republican cause any harm. The verdict of the arrondissements would be the same as the verdict of the departments, or, if there were any difference, it would be that the absence of those opportunities of compromise which are afforded by large constituencies, each returning many candidates, would give the more advanced Republicans a decided advantage over the moderate. M. GAMBETTA's apparent bravado has turned out to be the simple truth. The elections of Sunday have returned a large Republican majority, and it is supposed, though as yet probably upon very insufficient grounds, that in this majority the Republicans of the Left are more numerous than the Republicans of the Centre. The Conservative party, as we pointed out at the time, ran a tremendous risk in insisting upon the choice of weapons in the electoral duel. Even if the *scrutin d'arrondissement* had yielded the precise results they expected, their adversaries would have been able to taunt them with being afraid to appeal to the country without first redistributing the constituencies; and now that the constituencies have been redistributed without success, they are left with no sort of explanation to offer, except that their policy is discredited and they themselves disliked. They relied upon their local influence to counteract the unpopularity of their administration: but the result has shown that there is a degree of unpopularity which no amount of local influence can get over. They have fared as ill in the arrondissements where they are known as they could have fared in the departments in which they are unknown. As though to show that they meant to leave undone nothing that could by possibility accentuate their defeat, M. BUFFET made a parade of his determination to remain in office during the elections, and to make full use of such administrative pressure as he could bring to bear upon the electors in order to secure their going in the right way. He nearly broke with M. LÉON SAY and M. DUFAURE because they directed their subordinates not to employ the influence of the Government either in bribing or in intimidating voters. The tradition which used to be so powerful in France was once more to be put to the trial, and it was to be ascertained by actual experiment whether the rurals could bring themselves to vote in contradiction to what they heard from mayors and prefects was the wish of the Government. In this respect also the Conservatives have had their way, and their way has turned out to be their folly. All that M. BUFFET succeeded in achieving was the reputation of being anxious to stifle the voice of the constituencies. What number of votes he lost by this means it is impossible to say. Judging by the result of the elections, he can scarcely have gained any.

Certainly, if the responsibility of making the elections what they are rests mainly with M. BUFFET, fortune has for once been fair in her dealings. His is the punishment as well. No other Minister has been equally on his trial before the country, and none has failed like him to get a seat in either Chamber. It seems hardly credible that the PRIME MINISTER of France, the responsible chief of what is supposed to be the strongest Executive in Europe, should have offered himself to four constituencies and have been rejected in all of them. It must be supposed that M. BUFFET did not pick out his constituencies at random, that he took anxious counsel with the prefects in order to ascertain the temper of the electors, and that he thought he was making everything safe by presenting himself at the same time before the four constituencies in which his repute was greatest. This is what M. BUFFET has reaped from his resolute dissociation of himself from the Republican party. He has posed in the presence of all France as the Arch-Conservative, and now there is not a constituency in the country which will consent to be represented by him. M. BUFFET has not attempted to disregard or explain away the vote of Sunday. He has resigned, and, what is more to the purpose, he has probably advised Marshal MACMAHON to accept his resignation. That he has done the best thing that was open to him to do under the circumstances is plain. If he had remained in office until the Chambers met, he might have involved his colleagues in

his fall. As it is, the deputies will be propitiated by this prompt acceptance of the decision of the constituencies, and the reconstructed Ministry may be able to postpone any important debate until there has been time to take the measure of the new members.

M. GAMBETTA's prominence in the country is as marked in the elections to the Chamber of Deputies as in the earlier elections to the Senate. He has beaten M. NAQUET, whom chance or ambition had marked out as the Irreconcilable most bent upon rejecting M. GAMBETTA's leadership, and in Paris the Radical candidates returned all found it necessary, or, if not necessary, at least very much to their advantage, to make their peace with M. GAMBETTA before the day of voting. When this fact is borne in mind, the significance of the Paris elections will be seen to have been exaggerated. It is very unfortunate, no doubt, that Paris should cherish an ineradicable passion for extreme Radicals, but it is a misfortune to which the world has by this time grown pretty well accustomed. Under all circumstances Paris will return the strongest Radicals that will serve her purpose; the really important consideration both in the elections of Sunday and in the elections to the Senate is what her precise purpose was. Upon this point at least there is no room for uncertainty. The campaign of the Irreconcilables in the autumn had stated the issue between them and M. GAMBETTA in unmistakable terms. M. GAMBETTA accepts the Constitution of February; M. LOUIS BLANC and M. NAQUET reject it. M. GAMBETTA sees nothing incompatible with Republican Government in a Second Chamber, or in a President capable of being re-elected and possessing the right of dissolving the Legislature; M. LOUIS BLANC and M. NAQUET hold that a Constitution invested with these characteristics is nothing better than a Monarchy in disguise. M. GAMBETTA regards the existing Republic as a reality, which admits, no doubt, of being improved, but which has in the first instance to be preserved; M. LOUIS BLANC and M. NAQUET regard the existing Republic as a changeling which must be utterly got rid of before the true Republic can be created. Here is a perfectly intelligible series of distinctions—distinctions which go well to the root of the matter, and involve the gravest practical consequences. The really critical fact in the Paris elections is that, when this issue was presented to the electors, they made it clear that, for a Radical to serve their purpose, he must serve M. GAMBETTA's purpose also. It may be objected that M. LOUIS BLANC himself is among the deputies returned for Paris, and that, if the Paris elections are judged by the standard just suggested, M. LOUIS BLANC's opinions are more popular than M. GAMBETTA's. The answer is that M. LOUIS BLANC has obtained success by first laying down his arms. He did not present himself as an opponent of M. GAMBETTA; on the contrary, he submitted to have his name inserted in the list of candidates recommended by M. GAMBETTA. In point of fact, the chief of the Irreconcilables sought to be readmitted to the fold as the indispensable condition of getting returned. This is not the attitude M. LOUIS BLANC would have taken if he had felt that Paris was as irreconcilable as himself. Instead of allowing the distinction between himself and M. GAMBETTA to drop into the background, he would rather have dragged it into prominence. Instead of accepting M. GAMBETTA's patronage, he would have defied his opposition. What is true of Paris is true of the other great cities. In every one of them there has been ample opportunity for the Irreconcilables to take up M. GAMBETTA's glove, and in every one they have either exercised a prudent discretion by accommodating their professions to their fortunes, or have declined to come forward at all, or have come forward only to invite defeat.

As regards the political complexion of the Republicans who have been returned to the new Chamber it is impossible to form any positive opinion. They have mostly been represented as belonging to the more advanced section of the party. But this estimate comes from Conservative sources, and allowance must be made for a natural disposition to represent their own defeat as being at the same time a defeat of moderate men of all parties. A great number of the deputies are untried men, whose place in the Chamber cannot be exactly assigned. Unless the temper of the country has been strangely misread, the violent doctrines attributed to them will prove to be summed up in a violent dislike of the late Prime Minister, a sentiment which is not of necessity either revolutionary or immoral. The strength of the Bonapartists in the new Chamber is less than we should have been inclined to predict. It does not exceed, even if it does not fall short of, the hundred seats which M. GAMBETTA long ago estimated that they would secure; and considering how favourable the policy of the Government during the last two years has been to the Bonapartist cause, to have been stationary is almost equivalent to losing ground.

RECENT ELECTIONS.

SINCE the introduction of the Ballot no Government, however large a majority it commands, can afford to be lulled into security. The sudden and complete reaction which drove Mr. GLADSTONE from office is likely to become a precedent. It may perhaps be desirable that the Ministry for the time being should be stimulated to vigilance by conscious insecurity of tenure; but constituencies are influenced by many considerations which have little to do with the policy or merits of a Government. During the last Session it was often said that the anarchy of the Liberal party and the personal rivalries of its leading members rendered it impossible for the Opposition to succeed to office. Since that time the discipline of the party has been in some degree re-established; and the habit of united action will gradually tend to create a common purpose; but the dangers which the present Government has reason to apprehend are neither immediate nor dependent on the disposition of the House of Commons. If the next general election results in the return of a Liberal majority, the difficulties of detail which may be found in the formation of a new Government will assuredly be overcome. About fifty elections which have occurred since the opening of the present Parliament have not materially altered the balance of parties; but of late the Government has not been uniformly lucky. Within the month of February three Liberals of extreme opinions have been elected, and two of them have succeeded to Conservative members. At Burnley the numbers of the minority had increased since 1874. Perhaps electors of moderate opinions were induced to join the Conservative party by the selection of Mr. RYLANDS as a candidate, and by the certificates of his merits which were furnished by Mr. GLADSTONE and Mr. BRIGHT. If merited personal retribution furnishes any compensation for political defeat, the better class of Manchester Conservatives may perhaps be consoled for the failure of Mr. POWELL. As a believer in newfangled theories and an enemy of established institutions, Mr. JACOB BRIGHT may perhaps sincerely think that Irish Home Rule may properly be regarded as an open question. Mr. POWELL's professed readiness to accept the pledge which was tendered to the candidates by Mr. BUTT and Mr. MITCHELL HENRY suggests reflections of a different kind. A professed willingness to inquire into the merits of Home Rule was an acceptance of Mr. BUTT's principle. A Conservatism which does not include the conservation of the United Kingdom is unintelligible except as a party badge. If Mr. POWELL had no scruples as to the dismemberment of the Empire, he might still have calculated more accurately the gain or loss which might result from tampering with sedition. The Irish agitators are the natural allies of the Liberal section to which Mr. JACOB BRIGHT belongs, and they have reason to hope for his support. As soon as they had induced Mr. POWELL to renounce the principles which he might have been expected to maintain, their influence with the Irish portion of the constituency was placed at the disposal of Mr. BRIGHT. On the other hand, Mr. POWELL probably alienated some of the most respectable members of his party, though it is impossible to ascertain whether his conditional adherence to Home Rule was the cause of his defeat. A fourth part of the constituency abstained from voting; some of them perhaps because they were indifferent between two adherents of Mr. BUTT. Another [illegible] of seceders have less excuse for their conduct. It is said that a certain section of the clergy of Manchester voted for Mr. JACOB BRIGHT, the professed irreconcilable adversary of the Church, for the purpose of expressing disapprobation of the Government. It matters little whether their complaints of Mr. DISRAELI were well founded. Their own proceeding was inconsistent with any public principle, although it is explained by one of the most notorious weaknesses of human nature. The vulgar fallacy that an open enemy should be preferred to an unaccommodating friend ought not to impose on any reasonable mind. The

ecclesiastics who followed Mr. BRIGHT have placed themselves on a level with mutinous Liberals who vote against their own convictions because their party declines to advocate contagious diseases or compulsory abstinence.

In the much less important borough of Leominster the Conservatives have suffered a serious discomfiture. It was supposed that the late member retired for the purpose of accommodating the Government by providing a safe seat for the SOLICITOR-GENERAL; but a local magnate who had not been consulted thought fit to display his resentment by starting as a candidate a member of his own family who had at one time represented the borough. The vacancy had been awkwardly created two months before a new writ could be issued; and a provincial agitator profited by the interval to prosecute a canvass which has proved unexpectedly successful. For twenty years Leominster had been uninterruptedly Conservative, and under a system of open voting it would have remained Conservative for twenty years longer. Mr. BLAKE'S election is probably as distasteful to the moderate Liberals of the borough and of the neighbourhood as to the party which has been actually defeated. The ultra-Radicals, when they welcome their recruit, will perhaps perceive that they have been hasty in denouncing the existence of small rural boroughs, which have passed under new conditions since the introduction of the Ballot. Some little time was required to accustom voters to the abolition of the influence of property and station. The cheap pleasure of thwarting with entire impunity landlords, customers, and employers is more keenly felt in obscure places such as Leominster than in great constituencies which have been accustomed to political contests.

Even the county constituencies, though they are still faithful to the party which they have long supported, furnish causes of anxiety to Conservative leaders and managers of elections. The tenant-farmers begin to waver in their allegiance to the great landowners who have hitherto nominated candidates. In Shropshire, in Dorsetshire, and in East Suffolk, the only significance of the recent contests has been that they more or less represented the antagonism of classes previously united. Mr. EASTON, indeed, who was defeated a few months ago in another division of the same county, is a Liberal; and East Anglian farmers perhaps associate his political principles with the demand of agricultural labourers for the franchise. The member for North Shropshire is, like his opponent, a Conservative and a landed proprietor; but he was not generally supported by his own class, and he probably received aid from the Liberals. The farmers who returned Mr. LEIGHTON were perhaps chiefly bent on asserting their own independence; but, when questions affecting the tenure of land are raised, the newly-awakened political ambition of the tenantry will be directed to definite objects. Mr. FOWLER, who was defeated by a considerable majority in Dorsetshire, is himself a tenant-farmer. Although it may be desirable that occupiers of land should not be considered as ineligible for county seats, the character of the representation would not be improved if it were transferred from the class to which it has hitherto been confined. It may be admitted that the farmers themselves acquiesce for the most part in the preference accorded to landowners. The contest in Berkshire was analogous to that in North Shropshire, although the result was different. It seems that a section of the farmers resented the nomination of the candidate who has been returned, on the not unreasonable ground that they had not been consulted. Those who desire to control county elections will show little political tact if they fail to recognize the power which is now exercised by the tenant-farmers. It would be suicidal to alienate allies who may be retained and conciliated by prudent deference to their legitimate susceptibility. The class which can at its pleasure decide an election may well insist on being at least nominally consulted in the choice of a candidate.

Whigs and old-fashioned Liberals probably regard successive borough elections with uneasiness and dissatisfaction. The latest additions to their own party will scarcely have been welcome. The gradually decreasing influence of the managers of parties over the selection of members is a change, and perhaps not an improvement, in the Constitution. Local capitalists and employers of labour, who add solidity to a party, incline more and more to Conservative opinions; and local agitators of extreme opinions are troublesome adherents. Neither party finds it easy to provide seats for some of its most useful members. Lord HARTINGTON himself represents a remote Welsh borough with which he has no permanent connexion. The Government, on the other hand, has for three months been in search of a constituency for the SOLICITOR-GENERAL, and he is at last compelled to resort to Horsham, where there was a vacancy immediately after his appointment. It is difficult in the absence of minute local knowledge to judge of the probable result of the contest; but in one recent election the votes were equally divided; and the present vacancy is caused by the exclusion of a Liberal member on petition. Sir HARDINGE GIFFARD may perhaps be well advised in descending in his addresses to the level of the humblest Conservative voter, but it is not altogether edifying to learn the grounds on which a law officer of the Government asks for the suffrages of the Horsham electors. Gratitude to Mr. DISRAELI for the franchise which he is said to have bestowed on the householders may be abated by the reflection that Mr. GLADSTONE swept away numerous limitations on the suffrage which were originally proposed by Conservative Governments. If commonplaces and innocent fallacies tend to promote his immediate object, the SOLICITOR-GENERAL is perhaps not to be blamed for condescending to the meanest capacities. If he is returned for Horsham he will of course vote with his party and his colleagues, and his readiness and spirit will be useful in debate. A defeat at Horsham, which is not improbable, would greatly embarrass the Government. It is easy to buy out a sitting member with a baronetcy, but no Government can give titles to the electors who must be consulted.

COUNT ARNIM.

IT is reported by a telegram which, like other telegrams, may possibly have a shadow of truth in it, that Count ARNIM is to be prosecuted once more, and this time his offence is designated as high treason. It is by the publication of the pamphlet entitled *Pro Nihilo* that he is supposed to have laid himself open to so severe a charge. Of high treason in the English sense of the word it is ridiculous to imagine that Count ARNIM has been guilty; but it appears from the pages of the pamphlet itself that Germans use the phrase in a sense of their own. Count ARNIM is constantly defending himself in its pages against the imputation that he has done something treasonable; and it would appear that by treasonable he means something improper in an official. It may be conjectured that, if the telegram is true at all, and Count ARNIM is to be further prosecuted, what is really meant is that he will be arraigned on the charge of having violated the article of the Code by which it is made a penal offence to publish official documents or betray State secrets to the detriment of the State. Whether the German Government would act wisely in prosecuting Count ARNIM on such a charge is a matter on which opinions may differ. *Pro Nihilo* is a most foolish composition, and shows Count ARNIM to be one of the silliest of men. To despise it, and leave it to be quietly forgotten, would therefore seem to be the course which a prudent Government would follow. The punishment already inflicted on Count ARNIM has also been very severe, for he has been disgraced, banished, and, worst of all, shown to the world at his real value. The last pitiful cry of a ruined exile might therefore be allowed to expend itself in the silence of space. But, on the other hand, it must be owned that the German Government may very justifiably think that some very strong mark of reprobation ought to be set on the conduct of a person who uses his former position as Ambassador to publish such a composition as *Pro Nihilo*. The author himself admits that the publication of the documents given to the world in *Pro Nihilo* is "contrary to every fair tra-"dition in the annals of diplomacy." That an ex-Ambassador should publish official documents without the permission of his Government, and for the express purpose of injuring and exposing the head of the Government, is certainly opposed to fair traditions. Count ARNIM exculpates himself on the ground that the documents published in *Pro Nihilo* were all communicated by the Government to the tribunal on the occasion of the late trial, and that the Public Prosecutor asked that all but one of them should be read in open Court. This may make a legal difference, and it perhaps reduces the extent of Count ARNIM'S violation of fair traditions. However, as Count ARNIM acknowledges that he has violated these traditions, and does what he owns to be wrong in him as an

Ambassador, in order that he may right himself with the public in his contest with Prince BISMARCK, there is little more to be said on the point. But it must be observed that other things are revealed in *Pro Nihilo* than despatches between Paris and Berlin. Count ARNIM has thought fit to give the substance of his conversation with the EMPEROR, and to record the precise terms in which, as he alleges, the EMPEROR himself complained to him of the arrogance and jealous domineering spirit of Prince BISMARCK. It is difficult to find terms of condemnation too severe for an Ambassador who lays before the public expressions used in the strictest confidence to him by the Sovereign. Loyalty and honour would be at an end if men entrusted with high office were not accustomed to think that such mischievous indiscretion as this is one of which they could no more be guilty than of picking a pocket.

Count ARNIM undoubtedly shows in his pamphlet that Prince BISMARCK is by no means a pleasant person to have to deal with when he is offended. He is by no means scrupulous as to the means he employs or the persons whom he sets to work. He does not play fair; he makes and takes all the advantages he can. He and Count ARNIM quarrelled, and there can be no question that Prince BISMARCK determined that Count ARNIM should get the worst in the quarrel. The real, if not the sole, origin of the quarrel was that Count ARNIM determined to be Prince BISMARCK'S successor. In the language of *Pro Nihilo*, the belief that he was indispensable gave Prince BISMARCK despotic power. "Suddenly a man arose who threatened to rob him of his "charm of infallibility, and whom the public pointed to as "his successor." It is one of the peculiarities of *Pro Nihilo* that it is written throughout as if Count ARNIM had nothing to do with it, and as if he were one of the heroes of ancient history, whose career it is interesting to study on account of his gigantic merits. However, as the pamphlet puts it, "suddenly a man arose." This man happened at the time to be Ambassador at Paris, and therefore occupied what was then a post of very great importance. The relations of Germany and France were very strained for some time after the war, and Prince BISMARCK was of opinion that it was he, and not this suddenly arising man, who ought to decide what the relations of the two countries should be. The difficulty was that Prince BISMARCK could not recall Count ARNIM as an English Foreign Secretary would recall an Ambassador of whose official conduct he disapproved, since no one but the EMPEROR could do that, and the EMPEROR had a tenderness for Count ARNIM, which this man of gigantic merit has now repaid by betraying the EMPEROR'S private conversations. On the other hand, Count ARNIM would not resign. He was treated, in his opinion, as no Ambassador ought to be treated; he was humiliated and insulted. But the more he thought Prince BISMARCK wanted to get rid of him, the more tightly he resolved to stick to his post. Whatever he did, Prince BISMARCK found fault with him; and, if the statements of the pamphlet are correct, he sometimes found fault where Count ARNIM had not deserved blame. To defend Prince BISMARCK is no part of the business of an English writer, and he is supremely indifferent to being defended by any one. But it must be remembered that, although there was a personal quarrel between the two men, in which Prince BISMARCK, partly through his unscrupulous way of doing business, and partly through the amazing indiscretion of Count ARNIM, was ultimately triumphant, there was also a real divergence of policy. Prince BISMARCK was not fighting about a matter to which the interests of Germany were alien. He had much larger, bolder, and more statesmanlike views than Count ARNIM, understood Germany and France far better, and was honestly bent on getting what was best carried out. Had the man who suddenly arose really succeeded at that time in robbing Prince BISMARCK of his charm, Germany would have suffered as much as the infallible CHANCELLOR.

Throughout the two combatants were in a wrong position. As Count ARNIM says, he could not make up his mind whether Prince BISMARCK was his official superior or not. The head of the Foreign Office seems to have a claim to the obedience of Ambassadors; but then, as Count ARNIM kept saying to himself, he was the Ambassador, not of the CHANCELLOR, but of the EMPEROR. Prince BISMARCK complained that the picture of the state of things in France given by Count ARNIM was quite out of keeping with that which he, Prince BISMARCK, was in the habit of presenting to the mind of his Sovereign. Count ARNIM replied that it was his business to enlighten the mind of his master. Prince BISMARCK on one occasion intimated that it would be as well if Count ARNIM coloured his reports so as to be in keeping with Prince BISMARCK'S views, and the obvious retort was that this was not the way to let the EMPEROR see two sides of a question. Count ARNIM was fully possessed with the notion that he was a man who had suddenly arisen, that the EMPEROR ought to profit by his virtue, wisdom, and experience, and that the destined succession to which the voice of the public called him might as well come soon as late. Prince BISMARCK was equally determined that he would not be replaced, and he was anxious to show that his destined successor was not at all fit to replace him. The EMPEROR also seems to have been quite at a loss to know what was the true position of Count ARNIM, and was as much bewildered as Count ARNIM himself. The theory that the Ambassador was a servant exclusively of the EMPEROR broke down in practice. The EMPEROR would not order Count ARNIM to leave Paris, and kept up a sort of kindliness towards him, but he could not prevent Prince BISMARCK treating Count ARNIM in a very high-handed way. All he could do was to pour into Count ARNIM'S faithless bosom confidential laments over the imperiousness of his CHANCELLOR. In theory, he ought to have either condemned and removed his servant at Paris or to have retained and upheld him. In practice, he kept him on and let him be bullied. This is not to the discredit of the EMPEROR. He was merely undergoing the sufferings of a person living in a moment of transition. The old traditions of the small Prussian Court had died out; the constitutional traditions of Germany had not yet been formed. In such a state of things, when differences arise, the strongest will and the boldest mind generally wins its way. Prince BISMARCK has won, and he has won so completely that it might be thought he would do much better not to seem to have any wish to trample on a fallen foe.

THE INDIAN LEGISLATION BILL.

WHILE some members of the House of Commons were silently wondering whether the head of the great Scotch house of CAMPBELL was really a bigger man than the Maharaja of JEYPORE or the Subahdar of the DECCAN, and while Mr. LOWE was calmly demolishing our Indian Empire as he has demolished classics, a Bill was slipping through an important stage of existence to which we think it imperative that public attention should be drawn. It concerns not so much the QUEEN as her representative; it has to do with the dignity and the efficiency of the Government of India, not with Imperial titles and high-sounding names. It seems that for some time past difficulties have been felt, or rather imagined to have been felt, with regard to the legislative powers of the Governor-General of India. They were uncertain. They were liable to be called in question. They were possibly "unconstitutional," though Mr. ROEBUCK has just told us that this term may often be used with very little meaning. Accordingly, last Session a Bill was brought in to set these doubts and difficulties at rest; and, if we recollect rightly, it provided that, in case the High Court thought any legislative enactment of the Viceroy to be at variance with any Act of Parliament, it was to resort to the following process. The Judges were to certify their opinion to the Viceroy, who was to certify to the Secretary of State, who was to take the advice of the Privy Council. This circuitous process having been abandoned, a new Bill has now been introduced which is to attain the same object, but by a different route. We may remark that the most sagacious observer could not have divined from the report of the debate on the second reading, as it appeared in the *Times*, that the present Bill was not of the most uninteresting, trivial, or trumpery character. A debate on the election of a night nurse in a county infirmary would have received more space and attention in a local journal. It is only from the *Morning Post* that we can discover how important are the consequences of the proposed legislation to the good and effective government of the dependency which is henceforth to be prominently associated with HER MAJESTY'S name. While we have been called apparently to exalt the dignity of the Viceroy in one direction, we are practically invited to degrade it in another; and Mr. FAWCETT was not in

the least overstepping the line of the strictest truth when he denounced this Bill as injurious to the power and position of the Governor-General. There is a good deal in the measure which repeats or consolidates previous Acts, or which is at least inoffensive and unobjectionable. That the Viceroy in his own Council should have power to legislate for all persons, all Courts, and all things whatsoever in our own territories; for all native Indian subjects beyond those territories; for Englishmen in native States, and for all persons on the high seas within certain limits; that local Councils at Madras and Bombay should not be permitted to handle certain vital or delicate subjects, such as the public debt, the currency, the post-office, religion, the army, our foreign relations, and the penal code; and that the Secretary of State shall have power to disallow any law or regulation passed either by the local or by the Supreme Council, is perfectly just, politic, and proper. But the Bill goes on to introduce two provisions for which no exigency has been pleaded, for which no justification has been put forth, which are likely to lead to most unseemly complications, and which are altogether inconsistent with the arduous task now imposed on a Viceroy round whom difficulties thicken and trials increase. It recites that, if a division of any High Court, in its appellate or extraordinary original jurisdiction, shall deem any law passed by the Viceroy, and not disallowed by the Secretary of State, to be repugnant to an Act of Parliament, the Judges may decide that such law, or part of it, is invalid. Then a copy of the judgment is to be sent to the Viceroy, who is either to repeal the Act or to refer it home, whereupon the Secretary of State is allowed to appeal to the Privy Council. And it is also provided that any Court-martial which may think like the High Court is to look to the Act of Parliament and completely throw overboard the Indian legislation.

These provisions, though professedly intended to restrict the power of the lower judicial Courts to arraign the legislative acts of the Indian Government, start altogether from an unsound principle, and may lead to amazing results. They seem akin to the sort of statesmanship which last year gratified disloyal natives and dismayed Anglo-Indians by the blunders of the Baroda case. By one class in India the proposal will be received with indignation; by another with incredulity; by some with pert approval; and by not a few with the malicious glee which is shown by a mischievous schoolboy when there is a prospect of the head-master and the usher coming to loggerheads. Nothing more delights certain sections of the native community than the excitement of an unseemly contest between two great powers in the State. There are always in India rich people with money to spend in gratifying their whims or airing their grievances, and there are fluent advocates who like to show that such or such an act is quite beyond the power of the State. The Zemindars of Bengal are invariably ready to cry out that some law taxing them or compelling them not to neglect their duty nullifies the Perpetual Settlement. Bigoted Brahmans would have retained Suttee in old days, and more recently would have deprived converts of the rights of inheritance and marriage. Wahabis are ready to arraign every act of the State and its officers with an acrimony compounded of sectarian zeal and political rancour. A score of things may happen at any moment to arouse these selfish and disloyal feelings, which will survive half-a-dozen Royal visits. The High Court may any day, when any law is found inconvenient, be turned into an arena for seditious and inflammatory political harangues. The Judges of the High Court are usually men of high character and independence, but they may be compelled to listen for hours to arguments which they cannot endorse, and may not like to check ardent and impulsive barristers bent on convincing their clients that the independent Englishman is not so easily put down. No matter if the case is visibly hopeless from the first. The High Court may ultimately decide that there is no repugnancy, but the object will have been gained. A rich and influential party will grudge no expense in feeding fat its hatred against law and authority; the tale will be diffused by the thousand channels of a seditious press into every bazaar of the province; and the half-educated and wholly credulous natives will have learnt with joy that there is a power somewhere which can safely insult the Viceroy and defy his officers. This is no imaginary picture. In a political trial held a very few years ago, a barrister, now deceased, delivered an harangue in favour of his clients which very nearly brought himself within the grasp of the penal code; and all readers must recollect passages in Indian history, from the time of IMPEY and HASTINGS down to recent days, in which, if statesmen were not lawyers, Judges showed plainly that they could be active politicians.

The true remedy for any possible abuse of power by the Viceroy is to be sought for elsewhere, and it is not far off. His laws are now passed after long deliberation, with full publicity, with ample time for petitioning, and under unrestricted comment. They are subjected to the revision of experienced colleagues whose careers have been spent in testing, applying, and suggesting all sorts of laws. His Council contains invariably one Englishman, previously unconnected with India, of the legal profession, who is always a good lawyer and occasionally has been a profound jurist. The assistance of Law Officers outside the Council, corresponding to the Attorney- and Solicitor-General, can be called in at any moment. The Secretary of State can put his veto on any project of legislation in any stage of its progress, even when it has been threshed out in Council and published in the *Calcutta Gazette*. Lord SALISBURY has no want of able and experienced advisers around him, in Council and outside it, who can be relied on to detect the minutest invasion of Parliamentary privilege. The House of Commons, too, is not likely to overlook its own dignity and rights. It will doubtless be contended that, by subjecting the legislative action of the Viceroy to the dispassionate revision of a high judicial Court, we are teaching the natives to understand a Constitution and to respect the tribunals of the land. The reply to this is that, on the contrary, we shall be inviting them to find reasons for delaying obedience and defying authority. In short, the Bill is an attempt to evade responsibility and escape unpleasant discussion. We are given to understand that the project has not been formally laid before the Indian Council; and the time for these alterations strikes us as most inopportune. One Viceroy is coming home; and a successor cannot be expected to take in at a glance the awkward situation in which he may be placed by these timid concessions. Our first duty is to teach natives to obey those laws which several of their number have actually helped to pass. Giving "a Parliamentary title "to the legislative powers of the Governor-General," as urged by Lord GEORGE HAMILTON, is all very well; but this can easily be done without inviting any knot of rich and discontented natives to challenge the highest authority of the Empire, and without turning a Court-house into a school for rabid declamation, under the mistaken notion that we are thereby establishing the "Reign of Law."

COMMONS INCLOSURE.

MR. CROSS'S new Commons Bill is designed to get the procedure in cases of inclosure out of the deadlock into which the change in public feeling on the subject has lately brought it. Inclosures in the way provided by Act of Parliament have been almost abandoned, because no owner of common land cared to risk the opposition which any proposal of the kind was almost sure to encounter in the House of Commons; and in their stead there has grown up a practice of inclosing with a high hand, in the hope that the fear of incurring expense may prevent those who have a right to object from doing so by process of law. It is certainly well that the uncertainty which has lately hung round the question should be removed. If an inclosure is not injurious to the public interest, and promotes the interest, or may be made to promote the interest, of the private owners, it is desirable that an owner should know the precise nature of the process he has to go through, and the nature also of the opposition which he has to expect. If, on the other hand, an inclosure is injurious to the public interest, it is clearly desirable that there should be some mode of applying for it unmistakably marked out, so that the objectors may at least know at what stage they must be prepared to offer resistance, and upon what body it is that they must endeavour to make their influence felt. Mr. CROSS proposes to attain these ends by making better provision for preliminary inquiries into the circumstances of each particular inclosure, and by leaving the responsibility of consenting to each inclosure entirely with Parliament. The first step towards an inclosure will be the publication, in manner prescribed by the Inclosure Commissioners, of the intention of the persons interested in a

certain common to apply to the Commissioners for a provisional order of inclosure. If the common is within six miles of a town of not less than five thousand inhabitants, notice must at the same time be given to the sanitary authority having jurisdiction in such town. The applicants are bound to furnish the Commissioners with particulars as to the population of the neighbourhood, the distance of the common from any towns or villages, and the provisions which it is proposed to make either for recreation grounds or for allotments in lieu of common rights. The Commissioners are specially instructed to require the applicants to state why they think it better that the common should be inclosed and not merely regulated, and why the inclosure is expedient when viewed in relation to the benefit of the neighbourhood. If this provision is properly carried out it will be one of the most valuable in the Bill. Nothing will more tend to discourage applications for inclosures than the necessity of showing cause why they will be a positive advantage, and not merely not a disadvantage, to the inhabitants of the district. The imposition of such an obligation on the applicants themselves makes the duty of the Commissioners in the matter absolutely unmistakable. If the plaintiff, so to speak, is ordered to show the Court that the granting of his prayer will be for the benefit of the defendant as well as for his own benefit, much more will it be the duty of the Court to see that this is thoroughly established. If the Commissioners are satisfied upon this information that a *primâ facie* case has been made out, their next step will be to order a local inquiry. For this purpose an Assistant-Commissioner will be directed to inspect the common, and to hold a public meeting at a time and place suitable for securing the attendance of the neighbouring inhabitants. Twenty-one days' notice is to be given of the meeting, and the notice is to state that the meeting is public, that it is held for the purpose of enabling the Assistant-Commissioner to hear all persons desirous of being heard on the subject, and that it is desirable that all such persons should make a point of attending the meeting. The proceedings at the meeting, together with all other results of his inquiries, are to be reported in writing to the Commissioners. If the Commissioners are now satisfied that, "having regard "to the benefit of the neighbourhood, as well as to private "interests, it is expedient to proceed further in the "matter," they are to frame a provisional order of inclosure, and submit it to the consideration of the parties interested in the common. When the necessary consents have been obtained, they are to submit all the facts to Parliament. The provisional order will not take effect unless it is confirmed by statute.

Mr. Fawcett has given notice of a motion declaring the provisions of the Bill inadequate for the due protection whether of commons generally or of the poor who are interested in particular commons. As regards the general drift of the measure, he inclines perhaps to lay too little stress on the necessity of Parliamentary consent to the validity of any order of the Commissioners, and on the obligation laid upon the Commissioners to put Parliament in possession of all the information they can get together about the commons it is proposed to inclose. It may be objected that the consent of Parliament has always been required for inclosures, and yet this has not prevented a very great deal of land being inclosed which would very much better have been left open. This was true, no doubt, until a very recent date, but it can hardly be said to be true now. The almost total cessation of inclosures during the last few years may be partly due to the uncertainty as to the course which legislation would take, and to the difficulty of getting Parliament to consent to any inclosure until that uncertainty was removed. But it was certainly also due to the growing conviction in the minds of those whose interest it was to inclose that the feeling of Parliament was setting more and more against them. If this conviction was well founded, is there any probability that Parliament will alter its mind on the question? We can see none. Mr. Cross's speech in introducing the Bill was an example of the change which has come over the Conservative party in regard to inclosures; and, with the working classes promising to be yearly a more important element in political calculations, it is highly improbable that either party will wish to be associated in their minds with a disregard either of the public interest or of the interest of the holders of rights of common. Even if Mr. Fawcett's estimate of the Commissioners is correct, and they will always lean to the side of inclosures, there is no reason to think that they will disobey the law as regards the nature or extent of the information which they are bidden to collect and lay before Parliament. When once Parliament is in possession of that information, the responsibility passes out of the Commissioners' hands. It is true that, if the opponents of inclosures have hoped that under the new legislation they would be able to leave off work, they have good cause to be disappointed. It will still be necessary to exercise unceasing vigilance in the House of Commons in order to ensure that no private interest is served at the expense of the public interest. But unless we are prepared to go the length of saying that no more inclosures shall be permitted, there is no means of dispensing with this necessity. So long as inclosures are allowed, on condition that they can be shown to be for the advantage of the community as well as for that of individuals, there will be a tendency on the part of the owners to try to present the facts in the best possible light for their own objects. No Commission, however carefully constituted, can be trusted to thwart these attempts so well as Parliament.

It does not follow, however, that because the general purpose of the Commons Bill is good, there is not great room for improvement in its details. Mr. Shaw Lefevre pointed out with much justice that, besides the inclosures effected through the agency of the Commissioners, there are others that are effected by the simpler process which had so nearly succeeded in the case of Epping Forest. To resist an inclosure is a costly business, and if the Corporation of London had not happened to possess rights of common in the Forest, it is probable that this great playground of Eastern London would have been lost. There is not, unfortunately, a wealthy Corporation always at hand to fight the battle, and if the Bill is to be the last word of the Legislature on the subject, it ought to provide some cheap and easy means of testing the legality of inclosures of reputed commons effected by the mere act of the owner without the intervention of the Commissioners. For example, it might be enacted that notice should be given to the Commissioners in every case of inclosure of waste lands, so as to enable them to make inquiry whether the Inclosure Acts applied to them. Or the Commissioners might be instructed, on receiving information of any attempted inclosure, to inquire into the owner's alleged right, and, in the event of this proving doubtful, to take legal proceedings to contest it. Without some provision of this kind a good deal of perfectly illegal inclosing may go on simply from the absence of any one rich enough to dispute the point. The true character and position of the Commissioners would be better understood if, instead of being called Inclosure Commissioners, they were called Commons' Protection Commissioners. The protection of commons is the function which under the new Bill they are mainly intended to discharge, and it would be well that this fact should appear in their title. The disposition of Inclosure Commissioners, as some one said in the House of Commons, will always be to inclose, and in like manner it might be hoped that the disposition of Protection Commissioners would more and more be to protect. A poor man who wanted to resist an inclosure in his own neighbourhood would be more inclined to go for help to a body whose official title showed that their work was to prevent commons from being illegally inclosed than to a body whose official title merely expresses that they are the authorized agents for inclosing commons. It is true, no doubt, that the Commissioners exist to give effect to private interests when they conflict with no public interest, as well as to defend the public interests against the attempted encroachments of private interests. But the latter is admitted to be the more important function of the two, and for that reason it is the one from which the Commission ought to take its name.

THE MEMORIAL TO KEATS.

A ROMANTIC fascination will always attach to the memory of those two "marvellous boys" whose names shine with a strange and almost unearthly lustre in the galaxy of English poets. But although the tragical element is most conspicuous in the desolate life and premature end of the author of the Rowley Poems—a boy still when he sought relief from starvation by suicide—a warmer human interest belongs to the brief career of the poet who was immortalized in the Elegy of Adonais. The anticipation of that immortality, which he dared not look for, would indeed have shed a brighter light over the almost solitary deathbed of Keats. English visitors to Rome will be familiar with that grassy slope amid the

ruins of the Honorian walls which forms the Protestant cemetery, and none of them can have turned unmoved from the humble tombstone, inscribed by the express desire of him who sleeps beneath with the mournful epitaph, "Here rests one whose name was writ in water." Experience has long since proved that the dying poet was unjust alike to himself and to the judgment of his countrymen. It did not need the exquisite tribute paid to his memory by a brother poet of still higher fame to rescue from oblivion that most musical "wail and remonstrance of a disinherited Paganism," which can only cease to be appreciated when the English language itself is forgotten. There was a fitness in the modest ceremony which took place last Monday in that quiet Roman burial-ground, where, more than fifty years after the stone with that sad inscription was placed over the remains of John Keats, a large assembly of English and Americans were collected round it to witness the unveiling of a medallion effigy erected in his honour on the pilaster of the neighbouring gateway. An address was delivered by Major-General Sir Vincent Eyre, who mentioned that the sculptor, Mr. Warrington Wood, had generously declined any payment for his work, and that the contributions would therefore form the nucleus of a larger fund for a bust proposed to be placed in Poets' Corner, if the requisite permission could be obtained. Of the requisite permission there can, we presume, be very little doubt under the present guardianship of the Abbey, though the honour has been considerably cheapened by the reckless facility, not to say indiscriminate eagerness, with which it has been hawked about of late years. It would be hardly possible for those who almost forcibly seized the body of Dickens to refuse admission to Keats. We have often expressed our opinion of the graceless Parliamentary Committee which has metamorphosed "the metropolitan abbey" into a sort of Pagan Walhalla for the worship—or rather the regulated inspection—of departed celebrity, that there is no need to recur to the subject now. It does not perhaps matter much whether one name more or less is placed on the miscellaneous bead-roll of the Westminster Abbey martyrology. But we shall not be misunderstood when we say that, if this sort of thing is to go on at all, few have a better claim to such posthumous recognition than the author of *Endymion*, whose body rests in a foreign grave beneath "the light of laughing flowers," which he told his friend Severn, just before the end came, had given him "the intensest pleasure he received during life, and which he already felt growing over him."

The brief career of Keats, with its bright promise so early nipped in the bud, was at best melancholy enough; but it is too much the fashion to make it out even more tragical than it actually was. The keynote of the popular view about him was struck by the brutal sneer of another poet, who was as fond of affecting a delicate sensibility as he was coarsely contemptuous of the reality. Byron, who tells us that he met the (certainly unjust) attack on his early poems by "drinking three bottles of claret and beginning to write" *English Bards and Scotch Reviewers*, could hardly be expected to appreciate the effect produced on such a mental organization as Keats's by the insolent and superficial abuse—for it cannot be called criticism—of *Blackwood* and the *Quarterly*. And he accordingly gave vent to his supercilious sense of superiority in the familiar couplet:—

> "'Tis strange the mind, that very fiery particle,
> Should let itself be snuffed out by an article.

But he was mistaken. When Keats was bidden, in the choice phraseology of his accomplished censors, "to go back to his gallipots" and remember that "a starved apothecary was better than a starved poet," he did not indeed drink three bottles of claret or sit down to compose a rejoinder as unscrupulous as the censure which evoked it. He did what was better. The claret perhaps he might, in those days before Mr. Gladstone, have found some difficulty in procuring, for in their sneer at his poverty the refined taste of his critics had hit upon its solitary basis of fact. But he wrote to his publisher that his own estimate of his shortcomings gave him far deeper pain than *Blackwood* or the *Quarterly* could possibly inflict; and to his brother he observed on the same occasion, with a manly wisdom remarkable at his age—he was little over twenty—"The only thing that can ever affect me personally for more than one short passing day is my doubt about my powers for poetry; I seldom have any; and I look with hope to the nighing time when I shall have none." Yet his career, though not so dark as Chatterton's, was not a happy one. Born in 1795, he began very early to show signs of a highly imaginative and ardent temperament. As a schoolboy he was energetic, popular, and pugnacious, combining, as one of his schoolfellows expressed it, "a terrier-like resoluteness with a noble placability"—altogether a very lovable boy. Indeed, like most men of any real greatness, he retained through life a certain boyishness of character, in spite of some peculiarities of an apparently opposite kind. Thus on one occasion he distinguished himself by giving a severe drubbing to a butcher whom he caught beating a little boy, to the enthusiastic admiration of a group of bystanders. He left school early, and it is remarkable, considering the intensely classical tone of his mind and poetry, that he was not much of a Latin scholar, and never learnt Greek at all, and was dependent for his mythological knowledge on Lemprière's Dictionary. Perhaps, as Lord Houghton suggests, he would have lost in originality more than he gained in the avoidance of mannerism by the mental discipline of a more prolonged and regular education. When he came to London to walk the hospitals, though he was poor, he was not left like young Chatterton in ignoble isolation. Leigh Hunt, Hazlitt, Haydon, Godwin, and Basil Montagu were among his early friends, and he seems to have had the gift of inspiring in his friends a devoted attachment, which he no less warmly reciprocated. There was nothing about him of the calculating selfishness which so unpleasantly discredits the lofty professions of Byron. Women are more accurate observers than men, and the description of his personal appearance, when about twenty-two, given by a lady who used to meet him at Hazlitt's lectures, may still be read with interest:—"His eyes were large and blue, his hair auburn; he wore it divided down the middle, and it fell in rich masses on each side of his face; his mouth was full and less intellectual than his other features. His countenance lives in my mind as one of singular beauty and brightness; it had the expression as if he had been looking at some glorious sight."

The two great sorrows of Keats's life came upon him close together. The first was the death of his brother Tom, to whom he was devotedly attached; the second, his passion for a lady, who appears to have fully returned it, but from whom he felt himself to be hopelessly separated by the want of means which made their marriage impossible. The treacherous constitution which he had inherited from his mother, who died of consumption, tended still further to depress him, though it did not break his spirit or interfere with his literary activity. But one night, two years before his death, on returning home in a state of great nervous excitability, he coughed on getting into bed and spat blood. He looked steadily at the stain on the pillow and then said quietly, "I know the colour of that blood; it is arterial blood; that drop is my death-warrant; I must die." Some years before Coleridge, after shaking hands with him, had observed to a friend, "There is death in that hand." However, he appeared to recover; but, in the following autumn, spitting of blood came on again, and he was ordered to spend the winter in Italy. Mr. Severn, a young artist who had just received the first gold medal of the Royal Academy which had been awarded for twelve years, abandoned his prospects in England to accompany him. They went first to Naples, and thence to Rome, where, on February 27, 1821, Keats expired so peacefully that his friend thought he was still sleeping. We have spoken already of the despairing epitaph he ordered to be inscribed on his tomb tone. Not many years later, another stone, with the inscription *Cor Cordium*, was erected near it to mark the resting-place of Shelley's heart. This is not the place for a literary criticism of Keats's poetry. That there is an immaturity alike about his genius and his character is true enough; but to speak of his work as promise only, and not performance, is a serious error. Had his training, his circumstances, and his physique, been other than they were, the result would no doubt have been more entirely satisfactory and complete. But, if "a thing of beauty is a joy for ever," his poetry will live, and that quite independently of the "psychological wonder," as it has been justly termed, of such poems being produced by a young surgeon's apprentice, with the scanty culture and opportunities which alone had fallen to his lot, and who died in his twenty-sixth year. Indeed it may be said that its permanent hold on the public taste is by this time pretty well assured. It bears traces, no doubt, of the mental and physical sufferings which darkened his closing years, but not the less also of that sympathetic and genial temper which endeared him so much to his friends during life, and has ever since stirred the responsive sympathies of a widening circle of readers, old as well as young, who know him only by his works. The requiem uttered over Byron's grave by another poet prematurely snatched away before the promise of his youth had been realized may be far more justly applied to Keats, except that it sounds too deep an under-note of implied blame:—

> Let feeble hands iniquitously just
> Rake up the relics of the sinful dust;
> Let ignorance scorn the pangs it cannot feel,
> And malice brand what mercy would conceal.

There is little or nothing, indeed, in the moral character of the author or his poetry which requires to be concealed. To compare "the Keats of 1818 with the Mr. Algernon Swinburne of 1866" betrays a curious infelicity of judgment which could only be exhibited, we need hardly say, in the columns of the *Daily Telegraph*. Admission into Poets' Corner could never certainly be refused to him on the grounds which barred the entrance of Byron into those sacred precincts, if sacred they are still to be accounted in presence of the motley crowd of recent applicants for such questionable apotheosis. That he left his work unfinished was no fault of his, nor did he follow the lamentable example of Chatterton in deliberately cutting it short by a crime disguised under the sonorous misnomer of "a noble insanity of the soul." English poetry has no cause to be ashamed of the name of Keats, though there is much room for regret that he did not live long enough to vindicate his title to a yet higher eminence in the Temple of Fame.

RAGUSAN ARCHITECTURE.

WE have spoken in a former article of the general aspect and the historical position of the city and commonwealth of Ragusa, her hills, her walls, her ports, her combination of freedom from the lion of St. Mark with half dependence on the crescent of Mahomet. But this ancient and isolated city has yet something more to tell of. There are one or two of the municipal buildings of the fallen republic, buildings which, as far as we know, have never been studied or illustrated in detail in any English work, and

of which no worthy representation can be found on the spot. In the work of Eitelberger all that can be wanted will be found; but for the ordinary English student there is no help at all. Yet these buildings may really claim for Ragusa a place among those cities which stand foremost in the history of architectural progress. And this fact is the more remarkable, and the more to be insisted on, because of the general belief that there is little or nothing to see at Ragusa in the way of architecture. But the truth is that far more of the old city escaped the earthquake of 1667 than would be thought at first sight. Because the cathedral is later, because the general aspect of the main street is later, the idea is suggested that nothing is left but the municipal palace. That alone would be an important exception, but it is by no means the only one. If the traveller leaves the main street and turns up the narrow alleys which run from it up the hills on either side, alleys many of them which, at present at least, lead to nothing, he will find many scraps of domestic architecture which surely belong to times earlier than the great blow of the seventeenth century. Signs of that blow are seen in many places in the form of scraps of detail of various kinds irregularly built up in the wall; but there are a great number of pointed doorways still in their places which no man can think are later than 1667. There is also a not unpleasing type of Renaissance doorway, a lintel resting on two pilasters with floriated capitals, which one can hardly believe are due to a time so late as the days after the earthquake. In the churches too there is more left than the mere scraps which are built up again. Parts at least of the tall towers—neither of them detached—of the Franciscan and Dominican churches, the former in the main street, the latter near the eastern gate, are also earlier. In the former the line of junction between the older tower and the ugly church which has been built up against it is clearly to be seen. The upper stage of this tower and the small cupola which crowns it *may* be later than the earthquake; but, if so, they have caught the spirit of earlier work in an unusual degree, and all the lower part is in a form of Italian Gothic less unpleasing than usual. Both this tower and that of the Dominican church show how long the general type of the earliest Romanesque campaniles went on. Save the small cupola at the top, this tower has the perfect air, and almost the details, of a tower of the eleventh century; three ranges of windows with mid-wall shafts rise over one another; only they are grouped under containing arches in what in England we should call a Norman fashion. But, as this tower forms part of a Dominican monastery, it cannot be earlier than the thirteenth century, and its smaller details also cannot belong to any earlier date. Yet the general effect of this tower, even more than of the other, is that of a tower of the Primitive type. The Dominican church also keeps some parts in Italian Gothic which must be older than the earthquake, and the cloister is one of the best specimens of that style. Its groupings of tracery under round arches, the poverty of design in the tracery itself, strike us as weak, if our thoughts go back to Salisbury or Zürich; but the general effect is good, and the cloister—as distinguished from the buildings above it—may almost be called beautiful.

But the architectural glory of Ragusa is certainly not to be looked for among its churches. Two civic buildings of the highest interest escaped the common overthrow. They both—like other things in Ragusa—show the Italian Gothic in a form which is certainly less unpleasing than usual; but they also show something else which is of far higher value. They show that peculiar form of Italian Renaissance which can hardly be called Renaissance in any bad sense, which is in truth a last outburst of Romanesque, a living child of classical forms, not a dead imitation of them. Examples of this kind often meet us in Italy; we see something of it in the north side of the great Piazza at Venice as compared with the southern side; but the Ragusan examples go beyond anything that we know of elsewhere. Give the miscalled "Ducal Palace" of Ragusa—for Ragusa had no Doge, but a Rector—the same size, the same position, as the building which answers to it at Venice, and we should soon say that the city which so long held her own against Venice in other ways could hold her own in art also. The Venetian arcade cannot for a moment be compared to the Ragusan; the main front of the Ragusan building has escaped the addition of the ugly upper story which disfigures the Venetian. As wholes, of course no one can compare the two in general effect. St. Blaise must yield to St. Mark. But set St. Blaise's Palace on St. Mark's site; carry out his arcade to the same boundless extent, and there is little doubt which would be the grander. The Venetian building overwhelms by its general effect; the Ragusan building will bear the test of minute study.

The Palace of the Ragusan commonwealth was begun in 1388, and finished in 1435, in the reign, as an inscription takes care to announce, of the Emperor Siegmund. What name shall we give to the style of this most remarkable building, at all events to the style of its admirable arcade? Here are six arches—why did not the architect carry on the design through the whole length of the building?—which show what, as late as the fifteenth century, Italian art could still do, when it followed its natural promptings, instead of either binding itself by slavish precedents or striving after a helpless imitation of foreign forms. Never mind the date; here is Italian Romanesque in all its truth and beauty; here, in the land which gave Rome so many of her greatest Cæsars, the arcade of Ragusa may worthily end the series which began with the arcades of Spalato. Siegmund, the last but one to wear the crown of Diocletian in the Eternal City, has his name not quite unworthily engraved on a building less removed than a distance of more than eleven centuries would have led us to expect from the everlasting house of Jovius. Does some pedantic Vitruvian brand the columns as too short? The architect had grasped the truth that, as the arch takes the place of the entablature, the height of the arch may fairly be taken out of the height of the column. Does he blame the massive abaci? They are wrought to bear the greater immediate weight which the arch brings upon the capital, and they avoid such shifts as the Ravenna stilt and the Byzantine double capital. Does he blame the capitals, which certainly do not follow the exact rules of any Vitruvian order? Let us answer boldly, Why should art be put in fetters? A Corinthian capital is a beautiful form; but why should the hand of man be kept back from devising other beautiful forms? The Ragusan architect has ventured to cover some of his capitals with foliage which does not obey any pedantic rule; in others he has ventured—like the artists of the noble capitals which lie unheeded in the Capitol and in Caracalla's Baths—to bring in the forms of animal and of human, as well as of vegetable, life. In one point his taste seems slightly to have failed him; on some of the capitals the winged figures with which they are wrought savour a little of the vulgar Renaissance. But who shall blame the alchemist capital, engraved and commented on by Sir Gardner Wilkinson, the capital in which Ragusan patriotism has blindly seen Asklêpios himself brought from his old home at Epidauros? And the capitals bear arches worthy of them, round arches with mouldings and ornaments fitting their form. Altogether this arcade only makes us wish for more, for a longer range from the same hand. Compare it with the vulgar Italian work of the two neighbouring churches. Pisa and Durham might have stretched out the right hand of fellowship to Romanesque Ragusa before the earthquake; they would have held it back from Jesuited Ragusa after it.

The rest of the front cannot be called worthy of this admirable arcade. The windows behind the arcade are of the worse, those above it are of the better, kind of Italian Gothic; still they are Italian Gothic, and at Ragusa we should not welcome the loveliest form of tracery that Carlisle or Selby could give us. A Pisan arcade, pierced for light wherever light was wanted, would have been the right thing for the columns and arches below to bear aloft. He who duly admires the arcade will do well to shut his eyes as he turns round the corner by the west front of the cathedral; but let him go inside, and the court, if not altogether worthy of the arcade itself, is no contemptible specimen of the same style. It contains one or two monuments of Ragusan worthies as well as a fallen figure of Orlando; it is entered by a side door with two ancient knockers, one of them a worthy fellow of the great one at Durham; but its chief interest comes from its strictly architectural forms, and from the comparison of them with those made use of on the outside. The court is very small, and is surrounded on all sides, save that which is filled by the grand staircase, by an arcade of two, supporting an upper one. The composition is thus better than that of the front itself, as there are two harmonious stages in the same style, without any intrusion of foreign elements, like the pointed windows in the front; but the arcades themselves, though very good and simple, do not carry out the wonderful boldness and originality of the outer range. Columns with flowered capitals, with a remembrance, but not a servile remembrance, of Corinthian models, support round arches. Over these is the upper range of two round arches over each one below, resting on coupled shafts, the arrangement which, from the so-called tomb of St. Constantia, has spread to so many Romanesque cloisters and to so many works of the Saracen. Were this range open, instead of being foolishly glazed, this design of two stages of a true Romanesque, simpler, but perhaps more classical, than the arcade, would form a design thoroughly harmonious and satisfactory.

To our mind this palace, to which Sir Gardner Wilkinson hardly does justice, and of which Mr. Neale takes no notice at all, really deserves no small place in the history of Romanesque art. It shows how late the genuine tradition lingered on, and what vigorous offshoots the old Italian style could throw off even when it might be thought to be dead. One or two capitals show that the Ragusan architect knew of the actual Renaissance. But it was only in that one detail that he went astray. In everything else he started from sound principles, and from them vigorously developed for himself.

But the Palace must not be spoken of as if it stood absolutely alone among the buildings of the city. There is another civic building, which we must also hail as a true fruit, in some sort a more remarkable fruit, of the same spirit which called its greater neighbour into being. This is the former *Dogana*, its purpose as such being made clear by the word being wrought in nails on the great door. This building stands just where the main street and the *piazza* join, close by the arch leading to the town-gate. Here we have an arcade of five, the columns of which are crowned with capitals, Composite in their general shape, but not slavishly following technical precedents, with a heavy abacus, which, as well as the soffit of the round arch, is enriched with flowered work. One or two of them are none the better for a modern rechiselling. Here is something which is quite unlike Northern Romanesque, but which still is absolutely identical with it in principle; the column and the round arch are there in their purity, and the enrichment is of a kind which we instinctively feel is in place at Ragusa, though it would be out of place at Caen or Mainz or Durham. Whatever the date may be, the thing is thoroughly good, incomparably better than either the Italian Gothic or the cosmopolite Jesuit style.

Above the arcade are windows with the usual Venetian attempt at tracery, a large square window between two with ogee arches; above is a common Renaissance stage, which we may hope is a later addition. The merits of the three stages lessen as they get higher. Yet from the date, when we come to find it out, it seems not impossible that the arcade and both the stages above it may really be of the same date. This beautiful piece of Romanesque work—we give it that name in defiance of dates—was finished in 1520, when the world on the southern side of the Alps was, for the most part, running after the dreariest forms of the mere Renaissance. All the more honour to the architect who designed such a work at such a time; but it is thus rendered more likely that he built his arcade according to the promptings of his own genius, and added the two ranges of windows in deference to the two rival fashions of his time. Still the arcade, taken alone, is the last link in a chain which shows that the preservation of good architectural ideas at so late a time is no mere accident. The Dogana leads us back to the Palace; the Palace leads us back to the essentially Romanesque forms in the Franciscan church. All these point to the existence of a Ragusan style, an unbroken Romanesque tradition, which could not wholly withstand the inroads of the pseudo-Gothic of Italy, but which could at least keep its place alongside of the intruder. Such buildings as these, now so few, make us sigh over the effects of the great earthquake, and over the treasures of art which it must have swallowed up. If Ragusa, in her earlier day, contained a series of churches to match her civic arcades, she might claim, in strictly artistic interest, to stand alongside of Rome, Ravenna, Pisa, and Lucca. Her churches of the fifteenth century must have been worthy to rank with anything from the fourth century to the twelfth. One longs to be able to study the Ragusan style in more than one, or at most two, examples. In any case the Dalmatian coast may hold its head high among the artistic regions of the world. It is no small matter that the harmonious and consistent use of the arch and column should have begun at Spalato, and that identically the same constructive form should still be found, eleven ages later, putting forth fresh and genuine shapes of beauty at Ragusa.

L'ÉTRANGÈRE.

A PLAY of M. Alexandre Dumas fils involves at all times difficult and delicate questions for the English critic; but in the present instance we may congratulate ourselves that, writing for the Comédie Française, M. Dumas has confined himself within a world which is not that of the *Dame aux Camélias*, nor, indeed, of the *Demi-monde*, though with ramifications in the latter which are, however, rather kept in the background. We are in Parisian society, such as it is outside its most exclusive *salons*, pending the advent of a reformer. The passions whose play forms the main incidents of the plot are passions the consequences of which are worked out in society, and among persons socially recognized; and so far the critic's difficulty is lessened. One thing, it seems to us, which should be borne in mind when M. Dumas's writing is in question is that, though his plays may not be fit subjects for exhibition before a public that tolerates the *Timbale d'Argent* on the London stage, this does not mean that they necessarily corrupt the audiences for which he writes. His countrymen do not run the risk of making new acquaintances; they only see themselves on the stage somewhat uglier than they imagined. There he is a satirist and professedly a flagellator of vice; here he would be appealing only to a morbid taste for nasty subjects.

The subject of the play now in question is difficult to condense, chiefly on account of its length, and partly owing to its somewhat loose and disproportionate construction. Mlle. Catherine Mauriceau, the only child of a rich and besotted tradesman, was brought up in her father's house (he being a widower) by the best substitute that could be found for a mother, an excellent widow, whose son Gérard was the friend of Catherine's childhood, and became her lover before either of them knew what love was. Gérard is a model of all the manly as Catherine is of all the womanly virtues and graces; and when they came of marriageable age, they were to be united. But M. Mauriceau had judged otherwise in the profundity of his political mind. Gérard was only an honest man, and a good engineer: he loved the daughter and was loved by her, but he was not the son-in-law for a retired tradesman of the Faubourg St. Denis with twenty millions of francs in quest of social investment. This was intimated to him with the usual professions of esteem, and he, being a proper young man, withdrew, and endeavoured to solace his grief by zealous application to his professional duties. The mother understood her position, and followed her son into retirement. M. Mauriceau then invested his millions in a duke. The duke he found had been long—too long indeed for his honour—in the market, and [illegible] bill-broker might have informed M. Mauriceau of the value of [illegible]ture son-in-law's signature, had that worthy tradesman and at [illegible]ttom well-meaning father cared to know. "But that is just [illegible] a son-in-law I wanted," says Mauriceau, and Maximin de Septmonts took care to gratify him in the wish. The situation reminds one a little too much of the *Gendre de M. Poirier*, but, instead of the sprightly and amiable Gaston de Presles, whom M. Delaunay has clothed with a new interest by his recent personation, we have the hard, broken-down, cynical, ruffianly Septmonts, whose courage consists in ten years' training in a fencing-room, whose honour lies in the general recognition of that fact amongst the persons of his acquaintance, and who has just reached that stage in profligacy where he would be an adventurer if he were not a duke of legitimate descent. A duke, even in the present democratic state of French society, remains a duke. The coin, however clipped and sweated, is still currency, with an allowance for loss of weight. Mauriceau is rich enough to make the allowance and recoin Septmonts into a son-in-law for himself. The marriage takes place under the auspices of an enigmatic Mrs. Clarkson, of whom nothing is known with certainty, save that she is an American, has a legal husband in the Far West, two millions at her banker's, and has seen all the capitals of Europe. She is courted by the best male Parisian society. It was at her house that M. Mauriceau's millions and M. de Septmonts' debts made acquaintance, and by her agency they were finally linked in hymeneal bonds. The lady who supplied the link, and who is generally believed to be the Duke's mistress, received a pearl necklace worth 10,000*l.* from the father, and the son-in-law, out of his bride's dowry, repaid her a loan of 150,000 francs which she had generously advanced to pay his losses at *baccarat*.

The scene opens after eighteen months of matrimony at the Duke's hotel, where a garden-party is being given for the benefit of the poor. Amongst the crowd of paying visitors Mauriceau has found the doctor under whose auspices Mlle. Catherine made her first appearance in the world. Dr. Remonin is an Academician known to the world of science by his researches on Infusoria, particularly of the genus "Vibrion." He is also an old college chum of Mauriceau's, but this friendship has been somewhat forgotten by the latter, and their meeting on this occasion is due to chance and to the prosperous *parvenu's* want of a listener. From him Remonin learns what we have already sketched, and he gives him in turn some information about Gérard, who has considerably increased his titles to Mauriceau's esteem by enriching himself in his profession. He has hitherto kept aloof from the Mauriceaus, but on that very day he was seen by the Duchess walking in the gardens with the identical Mrs. Clarkson who had tied the knot of her fatal marriage. The lover of her maiden days has returned, the old love is quickened into action by the pang of jealousy, and the spectator can already foresee that the result will be an explanation, with its unavoidable consequence—a *rapprochement* between the lovers, a collision between two rival women, and a rupture in prospect between husband and wife. Hostilities at once begin with a *coup de théâtre*, which is very striking in its effect. The "Étrangère," who is interested in Gérard and acquainted with his previous history, loses sight of him as the Duchess with her party retires into the private apartments, and in her jealousy she imagines that he has joined them. Then she, the adventuress who has never crossed the threshold of any lady's house, the woman notorious for the men she has ruined and the suicides which she has caused—she, the reputed mistress of the Duchess's husband, demands, and in spite of the Duchess obtains, an entrance into the private drawing-room. Her introducer, none of the gentlemen consenting when challenged to serve as such, is the husband, Maximin de Septmonts. The whole scene is intense in dramatic power, and brings the exposition in the first act to a crisis.

The question naturally arises, How to separate creditably a husband and a wife between whom there is no union or possibility of keeping up appearances after the scandal of a public outrage, and how to bring together two lovers who respect each other in a manner worthy of their love? It is clear that the husband is very much in the way, and, further, that he intends to be so as long as possible, and to make the most disagreeable use of his power; he now insists that the Duchess shall return Mrs. Clarkson's visit, as that adventuress requires. The law of divorce does not exist in France; the naturalization of the parties in a land where divorce is permitted is a *dénouement* recently supplied by a case of real life, but more likely to occur to the ingenuity of the victim than to the dramatist who is free to choose his own means. M. Dumas does not as yet take us into his confidence, but he propounds, through the medium of Gérard's friend the Doctor, a comforting theory founded on the analogies of the animalcular world of "Vibrions." The Doctor explains to the Marchioness de Rumières, a cousin of the Duke's, who shares the general sympathy for the wife and detestation for the husband, that the latter must be got rid of physiologically. The dialogue between the Academician (M. Got) and the Marquise (Mme. Madeleine Brohan) is so peculiarly characteristic of both personages and of the play itself that we cannot refrain from quoting it at some length:—

Mme. de Rumières. Eh bien! et le mari—le duc—mon cousin. Mon cousin! Qu'est-ce que vous en faites dans tout ça?

Remonin. Je ne m'en occupe pas. Il disparaîtra au moment nécessaire. Les dieux interviendront.

Mme. de Rumières. Comme dans les tragédies antiques.

Remonin. C'est vous qui l'avez dit. Et les anciens avaient raison. Ils savaient aussi bien que nous, mieux peut-être, que le monde moral est régi par les mêmes lois que le monde physique, qu'il y a la même harmonie dans l'un que dans l'autre, et l'intervention des dieux n'était que la conséquence logique, la fatalité inévitable, résultant des actes humains.

Mme. de Rumières. Mais comment disparaîtra-t-il, mon cousin, car il est vivant et bien vivant?

Remonin. Il en a l'air parce qu'il mange, parce qu'il boit, parce qu'il s'agite, parce qu'il a la forme humaine; mais ce n'est qu'une apparence. Ce n'est pas un homme.

Mme. de Rumières. Qu'est-ce que c'est donc?

Remonin. C'est un vibrion.

Mme. de Rumières. Vous dites?

Remonin. Je dis: un vibrion.

Mme. de Rumières. Qu'est ce que c'est que ça?

Remonin.—Comment! Et vous dites que vous lisez mes articles et vous

ne connaissez pas les vibrions! Je vous en ferai voir. C'est charmant. Ce sont des végétaux nés de la corruption partielle des corps qu'on a pris longtemps pour des animaux à cause d'un petit mouvement ondulatoire qui leur est propre, qu'on ne peut distinguer qu'au microscope, et qui sont chargés de corrompre, dissoudre et détruire les parties restées saines du corps en question.

Ce sont les ouvriers de la mort. Eh bien, les sociétés sont des corps comme les autres, qui se décomposent en de certaines parties, à de certains moments, et qui produisent des vibrions à forme humaine, qu'on prend pour des hommes véritables, mais qui n'en sont pas et qui font inconsciemment tout ce qu'ils peuvent pour corrompre, dissoudre et détruire le reste du corps social.

Heureusement la nature ne veut pas la mort, mais la vie. La mort n'est qu'un de ses moyens, la vie est son but. Elle fait donc résistance à ces agents de la destruction et elle retourne contre eux les principes morbides qu'ils contiennent. C'est alors qu'on voit le vibrion humain, un jour qu'il a trop bu, prendre sa fenêtre pour sa porte et se casser ce qui lui servait de tête sur le pavé de la rue; ou si le jeu le ruine ou que sa vibrionne le trompe, se tirer un coup de pistolet dans ce qu'il croit être son cœur; ou venir se heurter contre un vibrion plus gros et plus fort que lui, qui l'arrête et le supprime. On entend alors un tout petit bruit. Quelque chose qui fait hu-u-u-u. (*Il souffle un peu d'air entre ses lèvres.*) C'est ce qu'on avait pris pour l'âme du vibrion qui s'envole dans l'air, pas très haut. M. le duc se meurt! M. le duc est mort. Allons, adieu.

With this comforting final assurance the author leaves us. Meanwhile the lovers' situation is, to say the least, embarrassing, and one is surprised to see such a judge of human nature as the Doctor expose two such young people to its dangers by facilitating an interview. On seeing her lover Catherine (Mlle. Croisette) throws herself into his arms. Fortunately Gérard is worthy of all the praise which has been lavished on him; he will be to her that *rara avis* of lovers, a brother and a comforter, and he begins by advising her to return Mrs. Clarkson's visit as the Duke requires. This she agrees to do after he has quieted her jealousy by explaining how he became acquainted with Mrs. Clarkson, whom he promises never to see again. The *tête-à-tête* is interrupted by the entry of the Duke; and the appearance of the young man, who is introduced by the Duchess as "the friend of her youth," coupled with her sudden acquiescence in her husband's will, generates the first suspicion in the latter's mind. It is confirmed by the suggestions of the "Étrangère" when the Duchess refuses to give up Gérard, and lastly by a letter from Catherine to the lover, which the husband intercepts.

Following the time-honoured precept *Festinat ad eventum* — somewhat forgotten in the third act, where M. Dumas takes advantage of Catherine's presence in the "Étrangère's" house to expound to us, in a tirade of unprecedented length, all the past history of that enigmatic heroine, who is evidently as perplexing to the author as she is to the critic—we shall hold to the main point and not allow ourselves to be dragged into episodical digressions. Of all Mrs. Clarkson's sins her greatest one is certainly against dramatic unity. That she was born of a planter and a coloured woman, was sold into bondage separately from her mother, from whom she inherited a mission of vengeance against the man who sold them and against the male sex in general, which mission she has done her best to fulfil by means of robbery and indirect assassination—all this long tirade which the author has inflicted on Mlle. Sarah Bernhardt, as if to strain that great tragedian's powers to the utmost pitch of endurance, is more strictly descriptive than dramatic. She is indeed the shade of the picture, but a clog on the action. The question before us is how the husband is to be disposed of and the lovers creditably united, and dramatically Mrs. Clarkson is only necessary so far as she contributes to this result. But for her designs on Gérard we should never have seen her in the Duchess's drawing-room nor the Duchess in hers, and the "Étrangère" would have disappeared from the play that bears her name. She has tied the nuptial knot which has to be untied, she has accelerated the rupture between husband and wife; but she does nothing more. She declares war against the Duchess, but she makes no attempt to injure her with Gérard or to recover the young man for herself. She looms as a stage-enemy behind the scenes; but she has a husband—a sort of rough shaggy "Far-Wester," somewhat too ready with his six-shooter—who has crossed the ocean to confer with Gérard upon a new method for the extraction of gold, and who may be useful.

We return to the main action, which culminates in the fourth act. The Duke has intercepted a letter from his wife to Gérard, and when he comes to seek an explanation he finds her in conference with the lover, whom he dismisses, taunting him with the lowliness of his mother's position. Then begins between the husband and the wife the most dramatic scene of the whole play, into which M. Dumas has thrown all his strength, and Mlle. Croisette all her vehemence. Convinced of the platonic nature of Catherine's affection for Gérard by the terms of the letter itself, and secretly chuckling over her innocence, he approaches his wife as a rake who has found a new interest in her. The love, which he never cared to win, has now the fascination of adultery; he asks for it in exchange for the criminating letter, which he offers to return. "Keep it, sir," she exclaims, in a fury of indignation, and she repels with horror and disgust the miserable wretch whose treatment of her as a bride has filled her heart with shame and anguish. At this moment the father enters, and characteristically, to avoid a public exposure, asks his son-in-law to name his price for the letter. One feels that only intense fury prevents the Duke from closing with the offer; he is bent on a separation that will dishonour his wife and on a duel in which he will kill the lover. Gérard offers a convenient opportunity by returning to ask satisfaction for the insulting remarks about his mother. The Duke prolongs the discussion with irritating blandness, so as to place himself in the position of the offended party, and secure the choice of weapons. He is a master of fence, and the rapier is the weapon he chooses. Nothing more is wanted but an unscrupulous second. Clarkson, with his expeditious Transatlantic methods, is, he thinks, the man, and he summons him to his assistance; while Maurice, to vindicate his daughter's honour, offers himself as the second of his son-in-law's adversary. The situation seems indeed desperate. The Vibrion Duke, whose death was promised at the outset by the Doctor, will live to kill the lover, dishonour the wife, and remain in sole possession of the stage. Even in the improbable contingency of his being killed, his widow can never become Gérard's wife, and he is determined to secure the ruin of the Duchess in the event of his death by placing the criminating letter in Clarkson's hands for production at the trial. But salvation comes from an unexpected quarter. Clarkson's heart is honest, though his hand is quick; the Duke did not see the difference when he chose him for an accommodating second. The Yankee will shoot a man without the ceremonial of the Paris Jockey Club; but he must have some reason for doing so, and the reasons the Duke gives are unintelligible to his mind. The Duke takes him for a fool, and explains: Clarkson sees he is a scoundrel, and tells him so. "No man ever said that to me," shrieks the Duke. "That's just what I wonder at," replies Clarkson. In a moment the parts are changed; the second—a by no means unusual occurrence—becomes a principal in the quarrel, but the Duke decides to take Gérard first. "Do you think," says Clarkson, "I am going to let you kill a man who is worth to me 25 per cent. in the working of my gold mines?" and he insists that they shall settle their business at once in the garden behind the house. They quit the stage, and in five minutes the Duchess is a widow, to the joy of all her friends. The Commissary of Police arrests Clarkson for the murder. "Queer people these," says the Yankee; but his wife comes to his help, and reveals herself at last in her real character as a secret agent of police. Her part is finished; her occupation gone; she will return to her husband and live with him under a more congenial sky. The Commissary calls on the Doctor to certify the death. "With pleasure," replies Remonin, who had foreseen it from the first.

The action, once clenched in the fourth act, is hurried on from scene to scene till the end with a rapidity and progressive intensity of interest which would prove Alexandre Dumas the greatest French dramatist of the age if he knew how to carry a plot through its intermediate stages as well as how to solve it. But in the first three acts he seems like a man entangled in the luxuriance of his incidents; then, with a few lightning-strokes, he cuts a path through his own jungle. The effect at the time is all the more startling, but on reflection one ceases to perceive the necessity for a jungle. This is not a method of composition to which the first stage in France has accustomed us, and we doubt whatever its immediate success whether the *Étrangère* will take a definitive place in a repertory of works constructed according to the permanent laws of dramatic art. The dialogue is sparkling with wit; it is nervous, concise, and always keeps the spectator's mind engaged even when the action lags behind. The character of Septmonts is thoroughly sustained by the author and the actor; it is the most original creation of the play, and every trait of this aristocratic ruffian is brought out, without excessive repulsiveness, by M. Coquelin's admirable discrimination. The Duchess is well drawn and well opposed to the Duke. Mlle. Croisette shows great progress in the part; she still wants ease in silence, continuity in action, and more flexibility of voice and manner, but her passion and vehemence in the fourth act were sustained with extraordinary power. The father is an amusing picture of a vain, foolish, self-conceited, and pleasure-seeking *bourgeois*, utterly blind in his paternal wisdom to the consequences of his acts, yet capable of exc
fortune. M. Thiron almost drew tears in the pa
the greatest difficulty of the play, and that is why he is left so long behind the scenes. The part was for some time rehearsed by M. Delaunay, but his recent illness entitled him to be excused from appearing in it. M. Mounet Sully does what it allows, but in a manner that shows that he would have done better to remain in his tragic robes, where his brilliant qualities are seen at their best. The "Étrangère" herself really contributes very little to the action; she delays it in the third act, and vanishes from it afterwards. Her character is a compound of negatives; born of the degradation of race and sex, she is a creature irreducible to any category of impropriety; ideally, a Nemesis of love; in reality, a Parisian antithesis half-dramatized out of a couple of sensational novels. Mlle. Sarah Bernhardt succeeds, however, in working this abortive creation into a dramatic picture that rivets the attention of the spectator from the moment she enters the stage till she quits it; but we hope that this mistress of her art will not be called upon to repeat the dangerous experiment of doing for an author what he should have done for him[illegible]. Her graces of diction, manner, attitude, and motion, h[illegible]orce, her power of impassiveness and repose, are unsurpas[illegible]e is the Cleopatra of the Comédie Française—

> Whom everything becomes—to chide, to laugh,
> To weep; whose every passion fully strives
> To make itself in *her* fair and admired.

M. Febvre gave us the best American that we have yet seen on the French stage. M. Got and Mme. Madeleine Brohan illustrated by their acting the paradox that none but the best actors can be safely entrusted with secondary parts; every scene in which they appeared gained unity, proportion, and symmetry from their cool

judgment and exquisite dramatic tact. To say that the minor actors did their work well sounds almost like an impertinence, for we are speaking of the only stage in Europe on which the dramatic art is understood as a whole.

THE UNDERGROUND RAILWAY MOB.

TRAVEL, according to Bacon, is a part of experience; and it could be wished that the experience gained from it nowadays were turned to better use. For years past a store of experience concerning the dangers of railway travelling has been accumulated, and as yet it cannot be said that safety has been gained by knowledge of peril. At a lecture given a short while ago at the Royal Institution it was shown that the danger of railway travelling was in proportion less, if anything, than that of staying at home; but this does not appear a sufficient reason for neglecting any possible precaution for the lives and limbs of those who do not stay at home. A man sitting by his own fireside may be attacked by fever, but that reflection will not induce him to mount a dangerous horse without bit and bridle. The unhappy events which have occurred lately on railways have directed unusual attention to their management or mismanagement; but it is to be observed that such events are in a greater or lesser degree constantly occurring. For one accident serious enough to be widely known there are probably many which by a lucky chance stop short of fatal or dangerous injury, and hardly reach beyond the knowledge of those immediately concerned, and for one of these, again, there must be many hairbreadth 'scapes of accident. It has been said that in the old coaching days there were as many mischances as there are now; and it is possible that there were in proportion as many overturns of coaches as there are collisions of trains; but in those times only a limited number of lives and limbs could be imperilled at once. The power of dealing danger and destruction wholesale belongs to modern travel as to modern warfare.

Although it is our present purpose to speak of the lesser rather than the greater terrors of railway travelling, we have said thus much of these because both have their origin in the same cause. The English public is proverbially patient and good-humoured, and on these qualities those who provide for its convenience and amusement are accustomed to rely. They know that gross inconvenience will be endured with the help of grumbling until the day when inconvenience is developed into something worse, and they trust that day may never come. But by the indolent habit which prevents them from detecting warning amid grumbling they do their best to hasten its coming. As to the public patience and good humour, which cannot but encourage this habit, and which is generally spoken of as a merit, it is possible that selfishness has a good deal to do with it. Few men are likely to attach as much importance to their neighbours' troubles as to their own, and all men are apt to underrate the extent of misfortunes which do not reach themselves. If you have been at some hotel where you have struggled with every kind of neglect and inattention and, meeting another who has been there just before or just after you and found things in a better condition, you detail your grievances to him, the strongest feeling you arouse in him will probably be one of self-congratulation. He will tell you, with pride in himself and contempt for you, that "he can only say he was not so particularly uncomfortable." There are men who carry this principle so far that they will convey a reproach to you for having missed the view from a mountain top by reason of a fog. "Ah! you should have gone up when we did," they will say, leaving you to conclude that to their convenience all the changes of nature are subservient. When a misfortune of travel attacks one of these people—when, for instance, his portmanteau is opened and its contents taken away during a journey—his indignation will be as great as his indifference was before; but he will find that it does not much affect other people. Thus, as long as individuals only are injured by mismanagement of matters which affect the public, one need not look very confidently for improvements. It is also to be observed that individual miseries are frequently put up with because the time and trouble spent in attempting to obtain redress would be a worse loss than the original one.

If these things were not so, probably some common protest would have been made long since against one piece of railway mismanagement which we have frequently noticed. Whenever an unusually large concourse of people is collected at a railway-station by some attraction that is to be reached by means of a train, there ensues what is called "a scene of indescribable confusion." An ever-gathering crowd presses round the trapdoor of the ticket-clerk, who may perhaps be excused if his temper falls short of the demands made upon it. The freedom which is dear to every Briton becomes a tyranny of elbows and heavy boots. The barbaric rush which assails the ticket-office spreads out on to the platform, where the carriage doors are besieged as if they were "claims" in a gold-field and the passengers were diggers. It has not unfrequently happened that a carriage has had to be defended by main force against an attack of roughs. This condition of things a paternal government in France has avoided by means which would probably be unacceptable here. Most of us, when pent up in a cage with glass doors at a foreign station waiting wearily for the unloosening of bars, have longed for the liberty of an English railway. And some of us, when struggling in the tumult of an English station, have remembered with regret the restraint we despised abroad. It is not beyond human powers, nor even beyond those of a Railway Company, to find something between the two extremes. The "queue," for instance, which plays a part in so many affairs of French life might with advantage be adopted, or rather enforced, at the ticket-office. Adopted in a sense it is; but the mystic words "In" and "Out," and the fact that the space between the clerk's trapdoor and the barrier opposite will only hold a certain number of persons, do not seem to appeal with any great force to the travelling public. Again, it might be not impracticable to issue for every train a number of tickets no greater than the number of passengers that the train will carry.

As nothing upon earth can be perfect, it would be unreasonable to look for perfection beneath the earth. It is not unreasonable, however, to expect some better attempt towards perfection than is found in the arrangements of the Underground Railway. Upon this railway there have been comparatively few accidents, and many of these have arisen from the folly of passengers, who, in getting out of a train, have not taken into account the ordinary laws of opposing forces. But of inconvenience, which may easily result in serious danger, there is here plenty to be found. From five o'clock onwards every evening the Underground Railway is greatly in request by men of business and labour in every class of life returning from their work. The result of this is that very much such an indiscriminate rush as takes place on rare occasions above ground is here repeated every day. Any one who has observed a train passing at this time of day must have noted that in many of the carriages every available space, both for sitting and standing, is occupied. And it is only natural that those who are anxious to secure these places should run at them with an utter disregard of what may happen to any one in their way. On week days this state of things is bad enough; but there is at least a chance of finding a carriage with a corner unoccupied. On Sunday nights it becomes intolerable. As a rule, every carriage in every train after it has passed a certain number of stations is as full as it will hold of people sitting in the seats, on the arms of the seats, and standing up, holding on to whatever they can find, like voyagers in a storm clutching at the rigging. One cannot but admire the irony which retains the placard "This carriage is constructed to hold so-many persons" when each carriage contains at least twice as many. The state of those passengers who hope to catch the last train is perhaps the most pitiable; for the chances are enormous against their finding a place, and the practice which obtains at theatres of returning money at the doors if there is no room has not, we believe, reached to the Underground Railway. Certain things may be easily said by the managers of the railway in defence of this gross abuse. It may be contended that they have a right to make as much profit out of their line as they can, and that no one is obliged to travel by it. But it may be questioned whether any one has a right to trade on the long-suffering of his fellow-creatures, and if no one is obliged to travel by this line, many people are induced to do so by the hope held out to them of finding reasonable accommodation on it. The placards of which we have spoken encourage this delusion; and we would suggest that after the word "passengers" should be added the words "and as many more as can be crammed into it." Again, it may be said that for the great convenience of reaching distant places given by this railway one can afford to put up with a little inconvenience. But the inconvenience of overcrowding is far from little, and there is assuredly no convenience in paying and waiting for a place in a conveyance which, when it reaches one, is choke-full. Perhaps when some serious mischance has come of the confusion and suffocation which may be seen any day at the times we have noted on this railway, its managers may attempt to remedy these abuses by increasing their staff and number of carriages, or by regulating the amount of traffic on it, or by some means which their superior wisdom will no doubt find ready. To interfere with a passenger's right to fight and struggle for a place would of course be infringing the liberty of the subject. But the liberty of the subject ought not to include the liberty to expose his fellow-subjects to unmerited dangers and sufferings.

MODERN GARDENS.

A TOLERABLY successful rebellion has been organized by people of educated taste against English upholstery and French fashions. A few courageous persons have actually presumed to furnish and decorate their houses according to their own wayward fancies, instead of on the principles approved by Messrs. Scroll and Gilder. Friends and acquaintances pay them visits in order to criticize and wonder, but, strange to say, are generally so struck with the charm that individuality gives to any room, and so much emboldened by the results of audacity, that they determine on the first opportunity to go and do likewise. Consequently a large demand has lately arisen for artistic wall papers, harmoniously coloured carpets, and picturesque fireplaces. In self-defence the large shops are obliged to try to meet the requirements even of those benighted beings who cannot fall down and worship the last new thing with the reverence usually accorded to it by the British public. It is easy to sneer at the present mania for bric-à-brac, but it is better than gambling and horse-racing. It is a question whether a costermonger who enjoyed having a painted flower on his tea-cup would be likely to kick his wife to death. However, owing to this revolt against ostentatious ugliness, good patterns and delicate com-

binations of colour may now be seen where formerly the goods exhibited for sale ought to have made an intending purchaser shudder and turn away empty-handed. Architects, too, have been obliged to realize the importance of domestic architecture, and many of the craft are able to build houses which, instead of being an eyesore to passers-by, are pleasant to look upon, and do not quite spoil the effect of a picturesque landscape. The apostles of art in the household, having now managed to persuade fashion to follow in their train for at least a time, will have leisure to turn their attention elsewhere. It would be well if they could be induced to step outside the well-cared-for dwelling-house and engage in a crusade against the modern gardener, a tyrannical and prosaic creature who holds the same position amongst the flower-pots that the upholsterer does amongst chairs and tables. Our gardens have degenerated for precisely the same reason that our mason-work is commonplace and our woodwork either distorted by objectless turning or painted in imitation of what it is not. Ignorance and want of taste in those who have money to spend must always have a fatal effect upon everything produced. Rich people buy stucco palaces because they have not learnt anything about architecture, and could not appreciate the difference between stone and plaster if they tried. They give orders for costly furniture; but as they have only a feeble idea of what they want, and scarcely the foggiest notion of what they admire, they leave these knotty points to be solved by some firm in whom a titled acquaintance has recommended them to have complete confidence. They value their house and its contents in exact proportion to what they have been made to pay for them. It is precisely the same with their garden. They know nothing about flowers, and can only judge of the merits of their pleasure-ground by the length of the bills and the number of men they keep employed. It never occurs to them that, just as a drawing-room, however expensively furnished, loses its fascination and air of comfort if let entirely to the care of the housemaid, so no garden can be at all satisfactory without the nameless charm that only can be given by the superintendence of a person of taste and cultivation. Little touches of refinement and subtlety are always required which even the best servants, except perhaps "lady-helps," can scarcely be expected to supply.

It is to be regretted that a larger proportion of those who live at their country places at least nine months of the year, and have nothing particular to do during those nine months, should not take up the pleasant pursuit of artistic gardening, and give to their own family and their friends the pleasure of seeing nature at its best. Of course we are not now speaking of show places, where a competent director like Sir Joseph Paxton takes complete charge, nor yet of those establishments where there is so large an area under glass that the great object of the unhappy proprietor is to get an experienced man who will be able to sell a sufficient quantity of forced fruit to lessen expenses. There are many imposing gardens of this description where the family find it almost impossible to have the commonest things in profusion, or even a sufficient crop of currants to make the jelly required. Scarcity and ostentation go hand in hand. It would seem, however, that in a small establishment there ought to be some one who looked after the garden. At first sight one might suppose that a young lady would feel as much interest in the roses that grow in the borders as in the artificial ones she places in her bonnet. But here certainly a difficulty does arise, owing to the intolerable position which the ignorance of employers has enabled our gardeners to assume—a position analogous to that taken by our cooks. The ordinary modern gardener, whose only knowledge of plants has been acquired by working in a nursery-ground, must appear to a real lover of flowers the most insufferable mixture of conceit and ignorance. He makes no attempt to learn how to keep the pleasure-grounds in beauty all the year round, and the kitchen-garden well stocked with necessary crops. On the contrary, his only ambition is to see his name appear on prize tickets at neighbouring flower-shows, and to sell in Covent Garden the fruit he cultivates at his master's expense. To gratify these noble aspirations he does not scruple to appropriate the hours which legally belong to his employers, nor will he hesitate to sacrifice all the flowers of a plant which should be covered with blossoms in order to perfect a single bloom for exhibition. He runs up long bills with his former master or at a neighbouring nursery-ground, and orders seeds from a London house which he has not always a definite intention of sowing, as well as bulbs which perhaps never appear except in the accounts. He tries to enforce the law that none of the family are to cut the flowers or touch the fruit; but if the lady's-maid happens to be pretty, she will find no difficulty in appropriating the earliest peach and the most cherished tea-rose. He cannot, however, bear to see anything given away by his master, and would rather let the plums spoil on the trees than pack them in a hamper to be sent as a present. It is impossible to induce him to sow a sufficient succession of crops of peas, spinach, and lettuce, so that, if some sowings fail, there will still be an abundant supply throughout the season. He prefers to spend all his energies on producing a few sticks of celery earlier than any one else, and a monster gourd which no one can use. It is rare to see a garden that is under the complete control of an ordinary gardener in which the supply of small fruit admits of the proprietor giving away generously to his poorer neighbours; yet no modern gardener would refuse to force pots of strawberries, so that he might send in a dozen tasteless specimens for a dinner-party. Amongst the flower-beds he is simply unendurable, as his theory of gardening consists in arranging everything in rows or patches, and on no account allowing any plant under his charge to display the cloven foot of natural habit. To him even a creeper growing at its own sweet will is an eyesore, and he has no opinion of such a rose as the cloth of gold, which refuses to thrive when pruned. A pyramidal azalea, the shape of a haystack, and so covered with bloom that not a single green leaf is visible to break the monotonous uniformity of its shape, is to him the perfection of art and beauty. In fact, no plant is worth much unless it requires to be kept in a hothouse all the year round. A flower that can grow without assistance is as little entitled to admiration or respect as a lady who does not require a maid to arrange her hair. He hates a primrose by the river's brim simply because it thrives without being transplanted every year, and, no matter how severe the season, bursts forth in bloom to be freely plucked by passers-by. The finest carpet of wild hyacinths or starry wind-flowers is to him mere trash; the tallest and most pearly-white foxglove only an awkward, lanky weed, to be pulled up and thrown on the rubbish-heap. He disclaims all acquaintance with our common perennial plants, on account of a vulgar way they have of growing anywhere, and a facility for reproduction quite contemptible. He digs up the monthly roses because they are not sufficiently double to please his artificial taste; he burns the wild honeysuckle, which crept through the hedge so prettily and dared to make acquaintance with aristocratic bedding-out plants. He invariably chooses the hottest part of the day for transplanting and watering, and gathers the fruit when it is raining. He takes possession of every green thing, and resents as an insult the slightest interference. When a suggestion is offered he perhaps replies that, if he is not supposed to know his own business, he had better go elsewhere. Unfortunately he is only too well aware how helpless his employer would feel if left with only a common labourer to whom he had to give directions; yet the amount of knowledge necessary to enable a lady or gentleman to train an intelligent working-man is easily acquired. It is possible to have a charming garden without a greenhouse, and plenty of wall-fruit with only the help of an experienced person to do the pruning. It is the attempt to have vegetables and fruit out of their season, and to cultivate plants which cannot be acclimatized, that makes our gardens troublesome, expensive, and unproductive.

It is curious to trace the results of this artificial method in a recent publication, *Floral Decorations for Dwelling-Houses* (Macmillan). Although Miss Hassard makes some valuable suggestions, the book has a false ring from the impossible bunch of flowers on the cover to the last page, in which the author recommends that in using ivy "the leaves should be brushed over with gum in a liquid state and then dusted with glass-dust from the glass-works, which can be obtained at a very small cost." The word "fashion" occurs in the very first page, a word which ought to have no connexion with any but artificial flowers. A plant may be scarce and costly, and therefore not common; but it is ridiculous to treasure a variegated geranium until it is to be seen in cottage gardens, and then throw it away and replace it by one not half so good but which costs twice as much. It is this vulgar habit of talking of things being fashionable, when "beautiful" is the word we ought to mean, that makes our houses, our parties, our pictures, our dress, so little worthy of an intelligent and cultivated nation. Miss Hassard's directions for making a bouquet consist in first telling her pupils to wire the flowers and then to determine the fashionable size "by taking a peep into some first-class florist's window." She is good enough to allow that "even common plants may be made to look effective in apartments" by taste and judgment; but all her directions savour of the modern gardener, and the ambition so to arrange real flowers that they may have all the appearance of being manufactured. Miss Hassard's crowning achievement is to cut a hole in the dining-table so as to enable her to conceal the central pot of her decorations, and make the plant seem to be growing out of the mahogany. This piece of taste will no doubt find immense favour with the public and be loudly applauded by the modern gardener. How different are the directions given by Japanese florists, whose great object seems to be by delicate devices to enable every spray to look at ease and in its right place! They will even leave a withered branch to give natural effect, or allow a few fallen leaves to remain round the pot. True floral decoration ought to be independent of all this wire and canvas, lace paper and glass dust, nor is it aided by small paltry make-believes, such as pretending that palms can grow out of table-cloths. It requires, to be successful, that the decorator should have a reverence for the natural forms of flowers and foliage, and a keen appreciation of harmony in colour. The true secret of gardening is to make the most artistic use of those plants which belong naturally to the climate and soil.

FIRES IN THEATRES.

CAPTAIN SHAW, the head of the London Fire Brigade, has rendered an important public service in again calling attention to the perils to which theatrical audiences are exposed from fire or panic. As far back as 1866 Captain Shaw gave evidence on this subject before the Committee of the House of Commons on theatrical licences and regulations, and urged the adoption of various precautions. The Lord Chamberlain's office has also from time to time given fitful attention to the question; but it would seem that the arrangements of many of the theatres are still seriously defective. It is well known that theatres are, from their peculiar construction and fittings, a class of buildings extremely liable to take fire, and

that in fact they are frequently burned down. Last year Edinburgh lost both its theatres by fire, and a theatre was also burned at Leeds. In 1869 the Prince of Wales's Theatre at Glasgow was destroyed by fire, and in the following year the Alexandra Theatre there shared the same fate. In 1867 Her Majesty's Theatre in the Haymarket was burned down for the second time. Almost all the London theatres, in fact, have been burned once or twice, and Astley's five times; and similar disasters are continually happening throughout the country. It is significant, as Captain Shaw mentions, that of all the regular or provisional buildings in which the Paris opera has found a home there is not one which has escaped a conflagration, and it remains to be seen whether the present house will be more fortunate. All these fires, except perhaps that of the Commune, broke out at intervals between the performances from want of sufficient care, and spread in consequence of the bad style of construction. As a rule, there has been of late years in our own country a singular immunity from loss of life in connexion with the burning of theatres; but Captain Shaw justly remarks that this ought not to blind sensible people to "the extreme probability, if not absolute certainty, that under different circumstances many persons might have perished." Even when a theatre is empty, its being on fire is a danger to the neighbourhood, and the consequences are sometimes of a most calamitous kind. It should be borne in mind also that a panic arising from a false alarm may be quite as terrible as an actual conflagration, and that panics are apt to be produced by the knowledge that precautions necessary for the safety of audiences are frequently neglected. Captain Shaw anticipates the criticism that, in pointing out the dangers which threaten playgoers, he is himself helping to create a tendency to panic; but his justification is obvious and sufficient. If a great catastrophe were to occur, and any one in Captain Shaw's position were to point out how it had happened and how it might have been prevented, there would be a general cry that it is easy to be wise after the event, and that the warning ought to have been given at an earlier date.

Captain Shaw, in the pamphlet (Spon) which he has just published, indicates the principal points of safety and danger in such places as theatres. The external street approaches should invariably be kept free and unobstructed. Each outlet should be easy of access, well lighted, and free from obstructions. As the safety of a building is necessarily in some degree affected by its position with regard to other buildings, a theatre ought under no circumstances to be completely surrounded by other buildings. "The practice of entering and leaving such a place," says Captain Shaw, "by a passage or set of passages through other buildings, and not direct from the street, is one so obviously dangerous in the extreme that it must be a subject of wonder how it can ever have been permitted in any country making even the pretence of taking care of its inhabitants." Speaking generally, he lays down the rule, which indeed is obvious enough, that a theatre is safest when it stands completely isolated, that every house near it is an element of danger, and that the risk is greatest when it is entirely surrounded by other buildings. Again, the manager's rooms and offices, the dressing-rooms of the actors, the store-rooms, the passages and galleries in the audience part of the house, the refreshment-rooms, staircases, and entrance-halls ought to be constructed of solid, heat-proof materials, and to form an essential part of the building, instead of being, as sometimes happens, "a mere collection of apparently temporary fittings, just able to carry themselves and the persons using them, and of no service to the general structure, but, on the contrary, a source of danger to it on account of their great inflammability." It is further advisable to divide the building into as many distinct and separate risks as possible; and Captain Shaw suggests for this purpose a fire-wall between the stage and the auditorium, with wrought-iron doors at the sides, and of course the usual opening for the stage, which could be closed on an emergency by a metal curtain. Another important principle in regard to safety, on which Captain Shaw lays great stress, is that each class of seats should have a separate entrance, so that, in case of an alarm, there would be no obstruction at the immediate point of exit from the seats. He also suggests that every part of a theatre should be licensed and legibly marked for the number of persons for whom there is room, in the same way as steamships, omnibuses, railway carriages, &c.; and that "it should be a misdemeanour here, as it is on the other side of the Atlantic, to occupy the aisles or passage-ways between the seats with camp-stools or chairs, to allow persons to stand in the passage-way during the performance, or in any way to interfere with the free ingress or egress of the audience in the common aisles." It is stated that, in at least one country on the Continent, the rule is that two exits are required to be provided for three hundred persons, and three exits for five hundred; and we agree with Captain Shaw that this principle of making, not only the size, but the number, of exits bear some fixed proportion to the audience, might with great advantage be adopted here. As for the stage, it ought to be effectually cut off by fire-proof passages from the dressing-rooms and other offices, and should on no account be in direct communication with the workshops or the store-rooms, nor should the latter communicate directly with each other. It is also laid down that, for the safety of the audience, a theatre ought to be provided with at least two principal staircases, which should be as far as possible apart; so that, in the event of one becoming injured by fire or enveloped by smoke, the other might be available. Moreover, every part of a theatre should be under the absolute control of a responsible official armed with the necessary authority, and there should be a supply of water in constant readiness under a pressure capable of forcing it to every part of the building. We need not follow Captain Shaw through all the details of the regulations which he would wish to see in force; but there is one point to which he attaches much importance, and which certainly deserves consideration. That is the necessity for a staff, not of amateurs, but of real firemen, who have had proper training and experience in their work. In France a number of *sapeurs-pompiers* are stationed at every theatre by order of the Government, but Captain Shaw admits the difficulty of introducing this paternal system in England. At the same time it is for the interest of the managers themselves that they should have a really capable and trustworthy set of firemen, who would be ready for their special duty, but who might also make themselves useful in other ways.

Taking the conditions of safety as laid down by Captain Shaw, who must be regarded as a competent authority, it will, we imagine, be found that there are few, if any, theatres which at present fulfil them. Without attempting to penetrate into the inner recesses of a theatre, any visitor can judge for himself how far on the outer side of the curtain adequate arrangements are made for any commotion among the audience; and if he takes the trouble to consider the matter, he can hardly fail to come to the conclusion that this branch of a manager's duty is very much neglected. The older and larger theatres in London are, as a rule, the best in this respect. Drury Lane and Covent Garden are completely isolated from other buildings, and have entrances on more than one side, each division of the house having its separate means of access. The Adelphi and the Gaiety are also well constructed in this respect; but there are some other theatres in this neighbourhood of which as much certainly cannot be said. Take the Vaudeville, for example. It is wedged in between other buildings, and has only a single narrow entrance in the Strand for all parts of the house, with the exception of the gallery. The staircases and corridors are also very contracted, and there are illuminated drinking-bars in every spare corner. Again, only a narrow gangway is allowed in the balcony and balcony stalls for people to get to their places, and these are usually blocked up altogether in the course of the evening. It is obvious that, in such a case, if there were any panic, there would instantly be a deadlock among the audience; for it is physically impossible that they could escape in time through the narrow apertures provided for their exit. At the first rush there would be a hopeless block, and the rest of the people would be left to be roasted or squeezed to death as the case might be. The chief entrance to the Opera Comique is in the very objectionable form of an underground tunnel from the Strand, but there is also a door on the other side. The Alhambra is a very bad example of a theatre, with only one outside door for the majority of a large, mixed audience. Even on ordinary occasions there seems to be a dense crush when the people leave, and if there were any disturbance the consequences would be horrible. At nearly all the theatres, however, the arrangement of the stalls is very bad, so little room being left between the rows that it is only by desperately struggling and scraping along that people can get to their seats, and once there they are so tightly wedged in that movement is impossible. For ladies this is not only a physical cruelty but an outrage on decorum, and it is really amazing that in a civilized society such a disgraceful and indecent practice should be allowed to continue for the benefit of greedy managers. As the audience leaves, each row of stalls has to empty itself in turn, and it is impossible to get out of a row without going to one end or the other; this is of course a very slow and troublesome process, and in the event of any commotion the audience would be perfectly helpless. The Lord Chamberlain might be expected to protect the public from such abuses, and occasionally some mild remonstrance issues from his office; but it has usually very little effect, except for a night or two. Not long since there was a notice from the Lord Chamberlain that managers must not fill up the gangways which are intended to facilitate free movement with chairs which completely block the way; but by this time the objectionable practice is once more in force. It might be supposed that when such an august functionary gave an order there would be somebody to see that it was obeyed. Besides, the want of proper space for movement along the rows of stalls in itself constitutes quite as great a danger as that of blocking up the communications, and ought to receive official attention. It cannot be expected, of course, that the Lord Chamberlain or his deputy should take charge of all the minor fittings of a theatre, but there are certain broad rules in regard to what is due to the safety of the public which ought to be distinctly laid down and strictly enforced. The theatres ought to be bound to show that they each keep a qualified staff of firemen, that entrances and exits are provided in proportion to the number of the audience, and that a certain proportion of seat-room is marked off for every person. It may be said that, if Captain Shaw's suggestions were to be carried out, it would involve the reconstruction of some of the houses, and no doubt the managers would not like it. On the other hand, however, it is difficult to see what right managers have to carry on their business unless they take adequate precautions for public safety. There are several theatres in London in which, if any alarm, real or imaginary, should occur, a frightful catastrophe would inevitably follow, and when this happens it will no doubt be regretted that reasonable precautions were not insisted upon at an earlier period.

PERSONAL INTELLIGENCE.

THE taste of the American public may be inferred from the fact that the *New York Herald* never appears without half a column or so of what it calls "Personal Intelligence." Such an item as "Bass is better" may be accepted as a compliment to ourselves, nor need we quarrel with the statement that "Lady Thornton leads Washington fashion." Many of these items, indeed, are not "personal" in any sense in which we should use that word, and some of them contain allusions which are lost on us for want of local knowledge. But, if we may infer the guests' appetite from the bill of fare, it cannot be doubted that scandal is greatly relished in America. This appears from the selection of real or supposed news which correspondents telegraph from Europe. The sort of things that are said in a Club smoking-room in London are printed and published in New York, and thus we learn that the Prince of Wales's friends desire the Queen's abdication, and are favoured with an epitome of a publication intended, as we presume, for a satire on the Prince. With this taste existing for imported scandal, it may be supposed that any home growth of the same article is accepted eagerly, and it happens that twice lately elopements, real or imaginary, have occupied the gossips of New York. The *Herald*, with commendable frankness, assumes that all classes of both sexes will "devour" a genuine sensation derived from the elopement of the wife of a prominent shipowner and millionaire of Montreal with "a dashing young English blood," and it proceeds to satisfy as far as possible the curiosity which it thus excites. The lady is young, beautiful, comely of person, and wealthy, and belongs to the most aristocratic circle of Montreal. The gentleman is also young, wealthy, travelled, "and withal dashing." Coming from a good family in England, he gained access to Montreal's aristocratic coterie, and at once became a lion with the fair sex.

We are giving here a fair abridgment of the *Herald's* narrative in order to show the kind of thing that its readers like. The "dashing" gentleman was introduced into a particular family, and at once became enamoured of the manifold charms of the mistress of the house. His feeling was ardently reciprocated, and ere the flight of many weeks clandestine meetings between the two panting young hearts were of almost daily occurrence. It must be admitted that the *Daily Telegraph* never comes up to this, nor is anything like it to be found anywhere, so far as we know, in the London or country press. At last the guilty loves of the erring pair became so ardent that Montreal was too circumscribed for them; so, taking advantage of her husband's temporary absence, the lady packed up her luggage, and with her two youngest children joined "her festive Don Juan" in a trip to the States. They crossed the frontier, rested three days at St. Albans, and took the train thence to New York. Scarcely had they arrived and quartered themselves at the Fifth Avenue Hotel, when the police, being put in motion by telegraph from Montreal, arrested the whole party, and conveyed them to the station, where comfortable quarters were provided for the lady and her children, but "the gay Lothario" was left to contemplate the inner decorations of a cell. We entirely approve the justice of this proceeding, although more than doubtful as to its legality. Next morning the prisoners, attended by counsel, appeared before a magistrate, who promptly discharged them. The lady was then escorted in the most gallant manner possible to a carriage by the gentleman; and, being entreated by her brother and brother-in-law, who had now arrived, to return to her heart-broken husband, she answered that "she would never leave her dear Frederick." Shortly afterwards the party took train for Philadelphia, and, as the gentleman lovingly handed his Venus and her little ones aboard a sleeping coach, he presented "a genuine fatherly appearance." It is, so far as we remember, a new feature in elopement to take the lady's children along with her, and the *Herald* seems to think it beautiful as well as new. The lady is a brunette, decidedly handsome and engaging in her appearance and manners, and bears every evidence of good breeding. She was very richly, but by no means gaudily, attired, wearing a long black silk cloak lined with ermine, a black velvet bonnet, and carried a sable muff. The gentleman has a very florid complexion, chestnut hair, and moustache and side whiskers of the blonde type. He evidently has plenty of nerve, and declares he will not give up his prize come what may. It would seem to be the opinion of the *Herald* that a more elegant elopement has never been performed. It is added that the gentleman was advised by counsel that in New York State he could be arrested for abduction, while in Pennsylvania he would be free from that annoyance.

This, we are bound to suppose, is substantially a true story. A reporter of the *Herald* had evidently seen the party off by train from Philadelphia, and it is the result of his own personal observation and judgment when he tells us that the lady was a lady and no mistake. He must have seen the children; and the arrivals of brother and brother-in-law, and afterwards of two detectives from Montreal, appear to have been actual occurrences. With us there is generally some sort of "royal" progress or visit going forward which happily supplies our newspapers with enough of "personal" details of a harmless kind. Pig-sticking by the Prince of Wales is at any rate a more wholesome topic than the elopement of Mrs. Smith, with or without children, and Mr. Brown. Besides, these stories are told abundantly in the Divorce Court, where, however, the reporters, having no eye for the picturesque, wholly neglect to inform us how the lady was dressed, or what colour was the gentleman's moustache. We do not doubt that the reporter of the *Herald* has described with sufficient accuracy the personal appearance of a lady and gentleman who came from Montreal to New York, and, let us say, eloped together. But in another such case the narrative published in the New York papers was equally circumstantial, and was correct in almost all particulars except that there had been no elopement.

In reference to this case the *New York Evening Sun* stated that "The daughter of one of the most celebrated physicians in Quebec has fled with an Irish nobleman, and sought concealment in this city." This is the mythical form under which the *Sun* presented the fact that Lord Dunraven had travelled from Quebec with the two daughters of Dr. Rowand. A supposed delinquent becomes charming even if she was not so before, and it is of course that a young lady who is believed to have eloped with an earl should be "said to possess the most attractive qualities." It is equally indispensable that something complimentary should be reported of the gentleman who has thus become distinguished, and accordingly his lordship, "who is said to have already made many conquests," is described as a bachelor and "a plain, unpretentious gentleman with a quiet reserve." It might have occurred to the editor of the *Sun* that, if all this were true, there was no need for either secrecy or flight, as the young lady might have married the nobleman either with or without her parents' consent. Although we are frequently awakened by the *Herald* of New York, we had not hitherto been enlightened by the *Sun*, and we do not accurately know for what sort of world that luminary shines. But, assuming that it has readers, what estimate must we form of their intelligence and refinement? We are told that the parties "travelled with the greatest secrecy"; but as they would probably come by rail, and were well known at Quebec, whence they started, this could be no more than one of those theatrical mysteries which fail to deceive the youngest playgoer. The *Herald*, whose business, to do it justice, is rather to embellish truth than to invent falsehood, took the most effectual means to contradict the *Sun* by sending a reporter to Lord Dunraven at the Brevoort House, and obtaining from him the statement that he is married and has a family, that he travelled from Quebec with the two daughters of Dr. Rowand, and had been confined to his room by indisposition. Thus far, as we understand, the *Herald* is stating facts learned from Lord Dunraven, but at this point inveterate habit carries it into inconsistent fiction. It goes on to state that the two young ladies are guests of Dr. and Mrs. Murray Nairne of New York, that Lord Dunraven had dined at Dr. Nairne's house, and had appeared with his party at the charity ball which the *Herald* in another column has described in its most brilliant style. If this sort of treatment of travellers is likely to become usual, English men and women of any distinction will think twice, or even thrice, before "concluding" to visit the Philadelphia Exhibition. We heard some time ago that journalism would be a "feature" of this Exhibition, and we think that examples ought to be shown of some of the biggest lies to which the newspaper press has given currency. A gentleman travelling to Quebec gives escort to two young ladies, and on this fact is founded the fiction that one of them had "fled" with him and "sought concealment" in New York. Then it is stated that "the facts of this startling elopement" had been known in the leading social circles of Canada for some days, but owing to the high position of the parties they had thus far been suppressed. We may be sure that, if any such facts did occur, the high position of the parties would excite in the press of New York intense competition for the possession of them. Indeed, in the case of the wife of the "millionaire of Montreal," where there would seem to have been facts, the *Herald* hastened to weave them into its usual ornamental style of narrative. It should be observed that in the case of Lord Dunraven the *Herald* of Thursday, 3rd February, stated, apparently as the result of inquiry by a reporter, that the Earl "had been confined to his room for some days," and added in the very next sentence that on Tuesday evening he dined with Dr. Nairne and went to the charity ball. Lord Dunraven on the 6th February addressed to the *New York World* a letter, in which, after noticing that, according to the pages of certain newspapers, he had since his arrival in New York eloped with a young lady, danced at a charity ball, dined out, been present at an evening reception, and lain concealed somewhere mysteriously for no good purpose, he states that at the same time he was, to the best of his own belief, lying ill in bed at the Brevoort House. Thus the *Herald* is contradicted as regards the dinner and ball by Lord Dunraven as well as by itself. At this season perhaps noblemen, English or Irish, are scarce articles in New York, and have got to be made the most of; and, as Lord Dunraven good-naturedly puts it, matters are becoming rather mixed with him, and he thinks of hiring a man to tell him who he is, what he is, and what commandment he is breaking. At Philadelphia in the summer there may be some safety in numbers; but, on the other hand, for every English lady or gentleman that is added to the list of visitors, an increased number of combinations with those already arrived becomes arithmetically possible. If only American editors could be content to write, and their subscribers to read, that Mrs Senator Tompkins wears blue velvet, their habits and tastes would not concern us. But it becomes alarming when a "plain, gentleman" is assumed to be a "gallant, gay Lothario" on no evidence at all, and apparently on the broad principle that those quiet ones are always the worst.

A BUSY BOARD.

IT is natural perhaps that the Metropolitan Board of Works, being a sort of local Parliament, should give itself Parliamentary airs. It makes a special ceremony of bringing in its Budget just as the other House does, and the member entrusted with the duty of course feels bound to vie with his Parliamentary prototype in the length and solemnity of his statement. Mr. Dresser Rogers, who had the other day to play this part at the Board, had, however, really something to say which deserves attention. The Metropolitan Board may not be altogether so ideally perfect as its members are in the habit of assuming, and Mr. Rogers was perhaps rather lavish with his superlatives, as, for instance, when he spoke of those "most gigantic paving operations, whole roads of miles in length covered with pavement of the most lasting character possible." A good pavement is very well in its way; but, after all, it is not such a very wonderful achievement of human ingenuity, and something ought also be expected to be done to prevent its being covered for days together with horrible mud. Again, when Mr. Rogers praises the City as being kept more tidily than any other place in the world, he suggests the question why the rest of London falls so far below this standard of cleanliness, and it may occur to some minds that the Common Council is not much given to long speeches. At the same time it must be admitted that the Board has a great deal to do, and that, up to a certain point, it does it very fairly; and it is only justice that the range of the duties thrown upon it, and the amount of work done, should be taken into account as a set-off against any shortcomings. It is now twenty years since the Board was first established, and it has not only, in consequence of the neglect and incapacity of the old Commissioners of Sewers, had a long leeway to make up, but has found its responsibilities continually growing. In those years the population within the metropolitan area has risen from 2,592,000 to 3,510,000; and the number of houses from 323,000 to 451,742. The area of taxation is 75,620 acres or 118 square miles; and the rateable value has risen from 11,283,000*l.* to 23,276,000*l.*, or more than double. In 1856, the first year of the Board, a penny rate realized 47,000*l.*, while now it is calculated to produce not far short of 100,000*l.* More than a million has been lent by the Board to the Vestries and District Boards for various improvements. The loans sanctioned under the Loans Act of 1875 to these bodies for the purpose of paving alone has amounted to 80,050*l.* The large main sewers are now to a great extent completed, but local branches have had to be, and still are being, made. During the past year the Board has further made various contributions to the local improvements of the metropolis, amounting to a total of nearly 50,000*l.* The embankment of the Thames has absorbed a large sum; the three branches of the work—the Victoria, Albert, and Chelsea Embankments—having cost altogether 2,403,269*l.* The charge of open places for the people, which has been entrusted to the Board, has also been expensive, as much as 343,000*l.* having been spent in buying up private rights. Mr. Rogers, after enumerating what had already been done, added that at the present time there were metropolitan improvements going on for which it was estimated that at least 783,000*l.* would be required. Notwithstanding its heavy expenditure, the Board has paid off all the debt left over by the former Commissioners of Sewers; but, on the other hand, it has incurred a total debt of its own to the amount of 11,823,000*l.*, which is reduced to a net sum of about nine millions by various recoupments, and the estimated value of surplus land. That the public, however, has confidence in the solvency of the Board is attested by the fact that the stock, which in 1870, when it first came into the market, ranged from 89 to 95½, last year never fell below 96¼, and went as high as 102¼.

It will be seen from these statements that the Metropolitan Board has a vast amount of business on its hands, and that, if it does not move quite so fast as some people would like, it is at least far from idle. It must also be remembered that improvements cost money, and that, though the Board finds no difficulty in raising funds at a moderate interest, the expenditure must sooner or later come out of the pockets of the public, and that there is a limit to the taxation which it is judicious at any moment to impose. Mr. Rogers notices the fact that the earlier improvements of the Board were almost entirely provided for out of the coal and wine dues; that is to say, the residents within an area of fifteen miles contributed to the cost of such works as the Thames Embankment and Queen Victoria Street. But at the present moment the greater part of the taxation required for public works has to be paid directly by the inhabitants of the metropolis proper, upon whom it falls very heavily. There is a large emigration from the rated area into the "outer ring," where population is every day increasing, and it is not unnatural that the Board should cast a longing eye after those who thus escape its powers of taxation, though they benefit to some extent by the costly improvements which are always going on. If, however, the outlay is large, there can be no doubt that there is a beneficial return for the money. Sewerage is not a very poetical subject, but we do not wonder at the enthusiasm with which Mr. Rogers described the thousand miles of sewers underground, "comprising 254 miles of main-drainage sewers built by the Board, sufficiently large for a man to walk upright in for their entire length," and the 776 miles of local sewers in connexion with the main system which the much-abused Vestries have constructed. From the language which Mr. Rogers used, one might imagine that he would regard it as a great treat for the public if the sewers could be thrown open for inspection at holiday times. People would then behold a sight which would no doubt astonish them, and would feel satisfied that they had got something for their money. These are undoubtedly works of which London may well be proud, and from which she cannot fail to derive substantial benefit in a more healthy atmosphere and soil. The death-rate of London has been much reduced from what it was in former days; and though it would be going too far to attribute this altogether to the operations of the Metropolitan Board, there can be no question that they have materially assisted in this direction. Admitting, however, the necessity and duty of pushing on with sanitary improvements, there is no getting rid of the fact that these are expensive luxuries, and that the large outlay in this respect is a serious question for the ratepayers. The total expenditure of the Board for 1876 is estimated at 848,000*l.*, with a set-off in the shape of contributions, rents, gas-meter fees, &c., of 168,937*l.*, so that 679,000*l.* remains to be raised by taxation. Of this latter sum, 34 per cent. will be obtained by indirect taxation, consisting of the coal and wine dues, and 66 per cent. by direct taxation by the Board's precept. This year, however, the net charge on the ratepayers will be about a penny less than last year, on account of the increased rateable value on which it is assessed.

One of the chief difficulties of the Metropolitan Board would seem to be the number of new duties which are continually being cast upon it. Formerly, for instance, the police used to look after dangerous structures, but this task has been transferred to the Board; and as it gives much annoyance and trouble, the demand that it should be made self-supporting seems not unreasonable. Then the Slaughter-houses Act came into operation last year, which has created more work than was expected, on account of the Board having been appointed as arbitrator with regard to the value of the cattle slaughtered. It is hoped, however, that in a few years this will not be an unprofitable part of the operations of the Board. Next, the Board has been saddled with the Explosive Substances Act and the Artisans' Dwellings Act. The Board is also responsible for the Fire Brigade, which, we have Mr. Rogers's assurance, is the finest in the world. The expense of the brigade is to some extent supplemented by the Insurance Offices, whose contribution this year will be nearly 10,000*l.*; but the Board thinks this ought to be largely increased. It will be seen, therefore, that the importance and responsibilities of the Board are continually expanding. It has the entire sanitary administration of a vast population, which is not only steadily growing in numbers but becoming more luxurious in its wants, and more fastidious as to the manner in which the streets and public places are kept; and, in addition to its natural functions, fresh duties are from time to time thrown on it by Parliament. The convenience of having such an organization always at hand for any piece of work which there is a difficulty in providing for offers a temptation which a Ministry finds it difficult to resist; but it may be doubted whether the camel, however strong and patient, will endure much further loading. On the whole, the impression we get of this Board is that it is a busy, active, and well-meaning body, just perhaps a little fussy and self-important, but doing good work in a steady way, though whether with a sufficient eye to economy is another question.

THE GASCON AT THE OLYMPIC.

THE success of an English version of *Le Gascon* is likely to be limited by the circumstance that there can be few or none of the hero's compatriots to applaud him. The excursions of French dramatists into Scotland have usually encouraging results in the theatres for which they write, but a bare translation of their compositions into English is generally the most effectual ridicule. In any language, however, snow is cold, and it is difficult to contemplate with gravity Mary Stuart sitting at night at an open window listening to an impassioned song which her lover breathes to her across the "frozen moat." If anything could excuse the conduct of the Scottish nobles to their Queen it would be the presence at her Court of such "followers" as Chastelard and the Gascon; and if, instead of attempting to murder the intrusive singer, they had marched him to the guard-house and put him in the stocks, our sympathy would have been apt to take their side. It is not so long ago that Englishmen regarded all foreigners as French, and therefore it is not wonderful that in Paris Scotchman is identified with Highlander. To our more instructed eyes it seems odd that the citizens of Edinburgh should wear kilts. But this is a mere detail. A more serious error is committed when four Scotchmen are shown to be such blunderers in homicide that they cannot effectually settle one Gascon. The house that bears the formidable motto "I make sicker" was not represented on this occasion, and so the Gascon, who had been left for dead in the snow, turns up as lively as ever in the Queen's chamber shortly afterwards. The Gascon lies and he dies, and we cannot be quite sure that in describing this play we might not misplace a letter. Chastelard, having sung his song, hides in the frozen moat while the guard makes its round, and then climbs to the window of the Queen's chamber and takes refuge there. Lord Maxwell and his friends knock and demand admission; the Queen and her lover suffer agonies of despair to appropriate music, until the Queen, kneeling and clasping in her hands a cross, causes by a sort of miracle a secret door to open, and there in a cupboard stands the irrepressible

Gascon, recovered at least temporarily from the bloody dirk which made not sure of murder's work, and ready for any service that love or loyalty can demand of him. Chastelard makes his exit by the way by which the Gascon enters, and then the door is opened and Lord Maxwell and friends march in and group themselves for the final tableau, which is to show us "how a Gascon dies," although at the last moment we are not sure that he does not mean to spell it with an "I." He is made a prince, and Mary Carmichael, the Queen's maid of honour, gives visible tokens of her love for him, and perhaps, under these encouraging circumstances, the fatal character of his wound may be mitigated. He has cheated so many enemies that it is difficult to believe that he will not in some way elude Death, and whether he live, or dies is to the British public unimportant, provided only that his adventures terminate in convenient time to catch the last train into the suburbs. The play has been elaborately got up, and Mrs. Rousby, who seems to be the accepted representative of Mary Stuart, has been engaged for the Queen's part, while Mr. W. H. Fisher, in a sleek comfortable way, enacts the romantic despairing Chastelard. To prevent disappointment, we may mention that the sorrows of this pair of lovers are not particularly affecting. The earlier scenes are laid in France, and here the ready audacity of the Gascon exhibits itself in amusing although scarcely novel circumstances. "Historical costumes of the period" do not save the *fete* in the Palace of Holyrood from dulness, and the play is so far true to history that Mary Stuart and her associates are unfortunate from the moment of setting foot on Scottish soil. As a play the *Gascon* is dreary, and as a spectacle it is not particularly brilliant. Like some other French products, it has suffered by change of climate.

This play is neither good history nor plausible fiction, and when we find the Gascon in Scotland we are moved to ask what business he has there? Both love and loyalty are equally outraged by the proceedings in which he abets Chastelard, and any rough Scotch noble who might knock the impulsive poet on the head would deserve his nation's thanks. Mary, we will assume, was not in this matter guilty, but only imprudent, although the author of the play or the actors of it make her more than sufficiently demonstrative in her affection. The address and boldness of the Gascon might excite more sympathy if they were employed in a more worthy cause. But the story comes to this, that one of the "Queen's Maries" promises him marriage if he will help the Queen in an intrigue. Scotchmen will perhaps not be highly gratified to see their Queen guarded on her road to Holyrood against her own subjects by two French adventurers. When the real Chastelard made the second of his mad attempts, the outcry raised brought the Queen's brother, afterwards the Regent Murray, to the spot, and he made short work of the audacious poet, as he would of the gasconading friend if he had laid hands on him. There used to be a French farce in which two sign-painters, who can get no work at home, go to Scotland, and succeed marvellously by ingenious impudence, very much as this Gascon does. But although to the French dramatist Scotland is a convenient *terra incognita*, it is not so to us. Such interest as this play has is derived, not from the absurd adventures of the Gascon, but from the character and position of the Queen, which form an unfailing stock-in-trade for dramatists. This character of the Gascon is doubtless convenient to French dramatists, as he might by the same method as is used here be insinuated into any other play. Scotchmen may see with impatience the gage which is thrown down by the Ambassador of England taken up by this impertinent intruder; for it is only justice to Scotchmen of the sixteenth century to say that they would sooner have fought for any of the factions into which their country was divided than not have fought at all. It may perhaps be correct to say that the Gascon serves to French dramatists the same purpose that the Irishman has done to our own novelists, and notably to Mr. Charles Lever, whose heroes gained, as we understand, several victories erroneously ascribed by history to the Duke of Wellington. Without entirely adopting the coarse expression which we find in the programme of this play, we may say that the Gascon shows considerable power of imagination, which quality is commonly ascribed to Irishmen. So many Scotchmen sought fortune in those days in France that it is perhaps fair to allow this one Gascon to exchange, if he thinks proper, his own sunny and fertile country for cold and barren Scotland. By way of foil to the Gascon and Chastelard, the author, with full warrant from history, has made Lord Darnley a poor little creature who has not even pluck enough to take up the Englishman's gage.

It is a comfort to think that when the dramatists have done with Chastelard (who, by the way, is not killed yet) an unlimited series of plays may still be made out of the history of Mary Stuart. There is her marriage with Darnley, the murder of Rizzio, the murder of Darnley and blowing up of the Kirk o' Field, the Queen's marriage to Bothwell, her imprisonment at Lochleven and her escape by the contrivance of George Douglas, and, lastly, her flight to England, imprisonment, and death upon the scaffold. Some enterprising manager should engage Mrs. Rousby to play Mary Stuart in Great Britain and the Colonies and America for the remainder of her professional career. Above all, the manager of Drury Lane Theatre should take in hand a subject so well suited to the capacity of his establishment. Let him read the following extract from Mr. Froude's History, Vol. VIII. p. 251, and calculate the pecuniary value of the suggestion contained in it:—"Darnley placed himself on the sofa at his wife's side. She asked him if he had supped. He muttered something, threw his arms round her waist, and kissed her. As she shrunk from him half surprised, the curtain was again lifted, and against the dark background, alone, his corslet glimmering through the folds of a crimson sash, a steel cap on his head, and his face pale as if he had risen from the grave, stood the figure of Ruthven." Answering Darnley's kiss with the one word "Judas," Mary confronts the awful apparition, and demands the meaning of the intrusion. Pointing to Rizzio, and with a voice sepulchral as his features, Ruthven answers:—

> Let your man come forth; he has been here over long.

After some inevitably effective "business," Rizzio is dragged off, and his screams are heard as he is murdered behind the stage. As nobody says much in this scene, there is no great demand for any qualifications in the acting beyond look and manner, and this consideration would be powerful with a modern manager, who might be trusted to perceive even more clearly the capability, pyrotechnic and otherwise, of the subsequent scene of Darnley's murder. Advancing further in the Queen's life, there might be a view of the lake and island which formed the scene of her imprisonment and escape, and here Scott's novel would become available for dialogue, which, however, would be prudently subordinated to spectacle. Not the least of Mary Stuart's recommendations as a heroine for Drury Lane would be that she was a well-practised horsewoman. Her ride through the night from Lochleven to Hamilton might be represented as completely as the resources of the theatre would permit, nor need the Queen be limited to the servant's dress in which she actually made that journey. One pony pony comes on at the Olympic drawing the cart in which the Gascon first appears; but at Drury Lane they could introduce, if need were, a dozen full-sized horses, and if it came to capability for spectacle this is something like the proportion between the two houses. As regards the Queen's character, it is enough to say that, while some of her subjects would have burned her as a murderess, others would have sacrificed their lives to win her smiles or spare her tears, and the dramatist may choose which of the two opposite views he pleases; nor will he need any hint as to which would be the more popular. In an age liberal of whitewash, Mary Stuart would be certain to receive as much as any incidents of her career may seem to require.

The character of the Gascon suits Mr. Henry Neville; but unfortunately it is on the English stage little better than an excrescence of a drama on the subject of Mary Stuart. It is scarcely likely, therefore, that this play will do much to confirm our notion that a mine of dramatic wealth exists in the history of the fair Queen of Scots. We believe, however, that the *Waverley Novels* for spectacle, and the works of Dickens for domestic drama, will long be profitable sources of inspiration. A play called *Jo*, derived from *Bleak House*, has just been produced at the Globe Theatre, and we infer from a photograph of Miss Jeanie Lee as Jo is, indeed, remarkable. Since this tale was written Potter's Burial Ground has been closed, and the proceedings of the Court of Chancery have been accelerated. But society is still desiring that the like of Jo would move on out of its sight.

REVIEWS.

LIFE OF LORD SHELBURNE.—VOL. II.*

THE second volume of Lord Shelburne's Life deals with the ten years from 1766 to 1776; and opens with the state of affairs when Lord Shelburne, then twenty-nine years old, accepted the seals under Chatham. At this time there were two departments, Southern and Northern, in the Secretary of State's office; the former having "the management of Home and Irish affairs, and of the correspondence with the States of Western Europe, India, and the Colonies." Chatham, who thought ill of this divided administration of the Colonies, determined to put an end to it. Rockingham had thought of doing this by making a third Secretaryship of State, but Chatham adopted the course of reducing the Board of Trade to a "Board of Report upon reference to it for advice or information on the part of the Secretary of State"; which course Hillsborough, the President of the Board, was very ready to accede to. The attitude of Lord Shelburne, who was thus enabled to give full attention to his department, alarmed Choiseul and Grimaldi, who, says Lord Edmond Fitzmaurice, "ever since the peace had been scheming how to win back what they had lost." Lord Shelburne, instructed by Chatham to demand settlement of England's outstanding claims against France and Spain, informed the Spanish ambassador Masserano that it was resolved to insist on the just claim to the ransom of Manilla, and that if the Spaniards chose to regard the American and Southern seas as their possessions, and to suspect a war from the English navigating there, "he had no hesitation to say that he would advise one, if they insisted on renewing such a vague and strange pretension long since worn out." The decisive action which Lord

* *Life of William, Earl of Shelburne, afterwards First Marquess of Lansdowne; with Extracts from his Papers and Correspondence.* By Lord Edmond Fitzmaurice. Vol. II. 1766–1776. London: Macmillan & Co. 1876.

Shelburne contemplated was however unfortunately prevented by the divisions of the Cabinet on the affairs of India and America. "Nothing," wrote Lord Shelburne to Chatham, "can be so unsatisfactory as the state of the Indian business is become," and that this was by no means an exaggerated statement is proved by the facts recorded.

The heads of a plan of reform, which Lord Shelburne himself thought of, are found in the same chapter with the letter from which we have quoted, written in 1766. Early in the next year the proprietors resolved to treat; but in their report of the points on which they judged it necessary to make an agreement with the Administration, there was nothing said of the concessions to be made to the State in return for the privileges to be granted to them. They had secured a friend in Charles Townshend, "who, regardless alike of the opinions of Chatham on Indian government, and of Shelburne on American taxation, had determined to conciliate the powerful Indian connexion at home, and to obtain a revenue by once more attacking the distant American colonies, the opposition of which, unwarned by recent events, he ventured to despise." To America the Mutiny Bill had been extended in 1765, and it was to run for two years. The question of compensation to the sufferers by the riots of the preceding year had been indiscreetly urged by Bernard, Governor of Massachusetts, who chose to substitute the word *require* for *recommend*; and there was an indignation aroused which Lord Shelburne's wise and temperate attitude when he came into power went far to smooth. His biographer has detailed his views upon this and more important matters of American policy; to all of which Townshend was opposed. The strange illness of Chatham helped his schemes; Lord Shelburne's continuance in office was obnoxious alike to the Bedford party, to the followers of Rockingham, and to those of Grenville. "The King had only admitted him to his councils out of deference to Chatham, and now willingly joined Grafton and Northington in denouncing him as a 'secret enemy,' and suggesting his removal." It was his own wish to resign, but he felt it to be impracticable while Chatham held the Privy Seal, and regarded him as his representative. On the 4th of September, 1767, Charles Townshend died suddenly of a putrid fever. Shortly after this Northington and General Conway resigned. Grafton now had an opportunity which he might have used better than he did. Bedford made his support conditional on Lord Shelburne's resigning the management of colonial affairs; and Grafton made use of the old controversy about the division in the Secretary of State's office, with the result that in the following January Hillsborough took the administration of the American Colonies, Weymouth that of Home Affairs and the Northern Department, and Lord Shelburne the limited sphere of action which remained. Before leaving the first chapter of Lord Fitzmaurice's second volume, which treats at length of the affairs we have touched upon, it may be interesting to quote the conclusion of a memorandum drawn up for Lord Shelburne, of the course which he thought advisable regarding America:—

> It remains now to be considered what measures under these circumstances it is most wise and becoming in Great Britain to pursue. I consider the Mutiny Act, and the requisition for a compensation to sufferers, as of no other consequence than as the dignity of Great Britain seemed staked on their support. The laws of trade and navigation are essential, and must be supported at all risks, and with every exertion of power. The other points are doubtful in their principles, and may perhaps be among those rights—to use a language which I do not understand—that are never fit to be exercised, and yet this subtle distinction is the sole ground upon which the repeal of the Stamp Act can be defended, consistently with the Act which affirms the right. The enforcing of the Mutiny Act will I am afraid create a general dissatisfaction in America, and involve all the Province, in one common cause of resistance—an effect which may be attended with the most fearful consequences—and the dignity of Great Britain be lost for ever together with her power, and the ends of those factious persons, who have excited the indecent and petulant resolutions of the assemblies there, be fully accomplished; yet if Great Britain does not in some shape put forth her dignity on this occasion, she may end by losing all credit and reverence in America, and lose likewise her power there, which is and must be in a great measure founded on opinion.
>
> Some measures therefore it seems ought to be taken of so bold and decisive a nature, as to convince the Americans that the long patience of Great Britain has been by no means owing to timidity, and yet the ends of those measures should be so manifestly just and important, as to leave no room for jealousies and fears in the minds of the sober and well-disposed, and thereby give no pretence for common measures of resistance, and it would be still more desirable if these measures could be directed against a particular Province.

From 1767 to 1768 Lord Shelburne was engaged upon the affairs of Ireland, and Choiseul meanwhile, convinced of the ascendency of the Bedford party, betook himself to his schemes of aggrandizement. Corsica had for long been in an unquiet state and the Genoese had often thought of selling the island to France; but in 1743 the English Government announced that they would not permit such a transaction, whereupon the Genoese Minister replied that there was no intention of attempting it. In 1767 France, being the creditor of the Genoese, made secret offers to Paoli, the Corsican, in consequence of which the Genoese again resolved to sell the island to France, with which purpose a treaty was signed on May 15th, 1768. Choiseul and Chatelet attempted to cover the matter with plausible assurance when the news reached England; but Lord Shelburne instructed Rochfort to demand a decided explanation, and at the same time despatched Mr. John Stewart as a secret emissary to report on the state both of France and Corsica. His letter giving an account of the island and its condition is vivid, and the description of Paoli is interesting. His conversation was "clear and intelligent," and discovered a knowledge of the various Courts of Europe. He was well acquainted with history, ancient and modern, and translated English correctly:—

> As to his management with the Corsicans, he seems to have them in a tolerable degree of subjection, merely by that ascendant which a man of parts and knowledge is sure to acquire over weak and uncultivated minds, and I find that like Numa and Mahomet he does not scruple to employ even visions, revelations, and dreams to strengthen his power. Religion seems to sit easy upon him, and notwithstanding what his historian Boswell relates, I take him to be very free in his notions that way. This I suspect both from the strain of his conversation, and from what I have learnt of his conduct towards the clergy and monks. If after all I may venture to pronounce wherein I think him deficient, I should say it is in personal courage. The manner in which he answered when I endeavoured to spur him on to some supported action, gave me first this idea, and then his complaints of sickness and feverishness as an excuse for his inactivity, seemed unsoldierlike and equivocal at best.

While Stewart was away, and French troops were landing in Corsica, Grafton had devised the singularly unwise scheme of sending assistance secretly to the Corsicans—a scheme which could only justify the hostility of the French without being of the least real service to the islanders. When Stewart's report and those of an emissary of Grafton's arrived, he lamented too late that he had been ignorant of the true state of affairs. The Corsicans were forced to submit, and Paoli fled to England. On October 19th Lord Shelburne, whose expulsion from the Cabinet Grafton, when the Corsican business was over, set himself to accomplish, gave in his resignation. On the day before this a squib appeared in the *Public Advertiser* which introduced him as a Jesuit; a year before a former one had spoken of him as Malagrida, and the nickname stuck to him afterwards in every squib of the time. Some time afterwards Goldsmith, sitting next to Lord Shelburne, said to him, with characteristic blundering in expression, "Do you know that I never could conceive the reason why they call you Malagrida, for Malagrida was a very good sort of man?" It is very curious to compare the characters of Lord Shelburne given by Walpole and by Jeremy Bentham. Walpole said of him:—

> He was so well known that he could only deceive by speaking the truth. His plausibility was less an artifice than a habit. . . . With an unbounded ambition of governing mankind, he had never studied them. . . . Thus a Catiline or a Borgia were his models in an age when half their wickedness would have suited him better—for when refinements have taken the place of horrid crimes, and the manners of men are rather corrupt than flagitious, excess of profligacy is more destructive to ambition than serviceable.

Bentham wrote of him that he was

> One of the pleasantest men to live with that ever God put breath into; his whole study seems to be to make everybody about him happy. . . . There was a prodigious deal of ambiguity in the general tenor of his language on party subjects, whether genuine or affected I cannot be certain. . . . His mind seemed always in a state of agitation with the passion of ambition and the desire of splendour. His head was not clear. . . . There was artifice in him, but also genuine good feeling.

Lord Edmond Fitzmaurice is of opinion that his reputation for duplicity was the result of "an overstrained affectation of extreme courtesy, and a habit of using unnecessary compliments in conversation."

After Lord Shelburne's resignation came troubles of various kinds. There were fresh riots in Boston; the English garrisons were expelled by the Spaniards from the Falkland Islands; France had hostile intentions; and at home the Middlesex election grievances were unredressed. Lord Shelburne, speaking in the House, said that abroad England had not, and could not get, an ally. After Chatham's motion (for an amendment to the Address "that the House would inquire into grievances, especially those of the Middlesex election"), which was lost, Rockingham gave notice that next day he would call attention to the state of the nation—when Grafton asked for a more distant day; "it was felt that the Chancellor's resignation was impending." Lord Shelburne cried that the seals were to go a-begging, but he hoped there would be nowhere found a wretch so base as to accept them under the inevitable conditions. Soon afterwards Grafton resigned, and North succeeded him, and found his advantage in the divisions of the Opposition. The terms in which the members of this spoke of each other on the occasion of the doubts as to some of Mansfield's legal decisions, and the steps to be taken with regard to them, are amusing. Disputes of all kinds went on, in the midst of which Lady Shelburne died, and Lord Shelburne resolved as soon as possible to leave England, which he did with Barré in May 1771. In Paris, among other distinguished men, he met with the Abbé Morellet, whom he afterwards entertained at Bowood, where were also Franklin, Garrick, Barré, and Priestley, who afterwards became Lord Shelburne's librarian. "Shelburne often confessed," says Lord Edmond Fitzmaurice, "that his connexion with Morellet was the turning point of his own career." In his own words, "Morellet liberalized his ideas."

What part Lord Shelburne took in the questions as to religious toleration, and those which followed concerning the East India Company, and after that the Boston tea ships, we may leave readers to discover from Lord Edmond Fitzmaurice's present volume. To the chapter on the last matter he has put the appropriate heading from Herodotus, Αὕτη δὲ αἱ νέες ἀρχὴ κακῶν ἐγένοντο. In the debate upon the Address to the King on the disturbances in North America a scene of singular violence occurred between him and Mansfield, his favourite antagonist, in which each accused the other of falsehood. At another time he was almost as violent against the Archbishop of York. But, as his biographer observes, the Duke of Grafton has noted in his memoirs that the debates at this time "were unusually frequent and warm," and Lord Shelburne's violence may have been in no way

exceptional. Lord Edmond Fitzmaurice's second volume, which concludes with a collection of various memoranda of Lord Shelburne's on "Men and Things," is perhaps less interesting than his first; but it often happens that the middle of a journey is not so pleasant as either the beginning or the end.

ENGLAND FROM A GERMAN POINT OF VIEW.*

WE opened this book in the expectation of finding in it something like a Teutonic counterpart of M. Taine's *Notes sur l'Angleterre*. We hoped to be improved by the spectacle, not of *esprit* making mock at our national characteristics, but of *Geist* loftily patronizing them. We hoped to see our social institutions passed in review, and Shakspeare once more proved to be "the poet of the German race." Visions of Arminius von Thunderten-tronck arose before us, with his tiresome dusty hair, his insufferable spectacles, his clanking military gait, and his talent for disagreeable plain-speaking. Now, we thought, a genuine Arminius from the Teutoburger-Wald is about to show us our stupidity, our vulgarity, our affection for claptrap; and Herr Rodenberg, being a German, will not even allow us the consolation that M. Taine did when he explained away all our foibles as a deposit from our fogs. But a grave disappointment was in store for us. Instead of a "scientifically developed ground exposition," a careful analysis of English life and literature with invariable reference to first principles, we found that *England, Literary and Social, from a German Point of View*, simply meant a string of haphazard magazine articles written by a German upon Chaucer, Shakspeare, Johnson, the Jews, the Clubs, and the Lakes. With regard to a magazine article there are always two questions that may be asked—Was it worth writing? and is it worth reprinting? In the case of the writing of a foreigner, a third question comes in, Is it worth translating? Herr Rodenberg's essays were perhaps worth writing, and possibly, for a foreign public, worth reprinting. Any way, we have the authority of the *Times* for the statement, which the translator takes care to quote in his preface (we hope, however, that the wording belongs to the translator, and not to the *Times*), that this book is "one of many efforts of the author to endeavour to make his countrymen know and love England." All "efforts to endeavour" to do anything so desirable ought to be encouraged, and yet we fear that we cannot answer our third question in the affirmative. The book was not worth translating. There is no "German point of view" whatever in it, except in the preface, and that is a German view of Germany, not of England. What is old in the book is not better told than it has been told a dozen times before, and what is new is mostly wrong.

"Kent and the Canterbury Tales" is the title of the first essay, and the first part of it, the gossip about Kent, is pleasant enough. We meet with the proper amount of enthusiasm for the English country gentleman, the "real kernel of the English nation," with his "baronial hall surrounded by its park and timber, a hundred years old." Timber a hundred years old is not very striking to look at, but that is by the way. Then we are told, to point the contrast between the mushroom nobility of England and its primeval gentry, that "none of the Upper House can trace their descent beyond 1264"—as though the first Baron de Ros had never owned a father, but had been literally "created" out of the primitive clay. The description of Canterbury of course leads to a description of the murder of "Thomas à Becket," and to a description of the tomb of the Black Prince, who, equally of course, won his plume and his "Ich Dien" at Cressy. Perhaps it is the "German point of view" which suggests the following remarkable sentence:—

> The choir of the Cathedral has an imposing effect when one first sees its pillars, its arches, and, walking under its vaults, thinks he beholds above him the arches of an oak-wood turned into stone, from which the German spirit obtained its first architectural inspiration.

These, however, are trifles, and we hasten on to the gist of the essay, its treatment of Chaucer and his pilgrims. Now Herr Rodenberg is genuinely fond of Chaucer, and we feel a tenderness for him on that account. But in dealing with him he shows a mixture of conscientiousness and credulity which is truly exasperating. He has heard of Ten Brink, whose book the translator speaks of under the deliciously muddle-headed title of "Chaucer's Studies of the History of his Development"; but he has never heard of the Chaucer Society, nor, apparently, of Sir Harris Nicholas. He confuses Alexander the Great with Alexander the Coppersmith, by talking of "*John* Morley's *English Writers*." He ignores the *Trial-Forewords*, and falls back for his facts upon a piece of book-making like Matthew Browne's *Chaucer's England*. The result is what might have been expected. Chaucer was "born in London," without any shadow of a doubt. Almost as certainly he dwelt long at Woodstock, although the poem in which that *is* asserted, the so-called *Chaucer's Dreme*, Herr Rodenberg admits that Ten Brink has proved to be spurious. "This song," he says, in the very next sentence to that in which he had made the admission, "is the only one in which Chaucer apparently painted the landscape scenery of Woodstock, and immortalized his residence therein." This is indeed a new style of criticism—to admit the spuriousness of a document, and yet to build pages of hypothesis upon it. But worse is to follow. The author is so wedded to his belief that Chaucer, young or old, lived at Woodstock (otherwise how could Mark Akenside in the eighteenth century have said he did?) that he will have it that he wrote the *Assembly of Foules* there, in honour of John of Gaunt's marriage with Blaunch of Lancaster in 1358. Of course Herr Rodenberg is not the inventor of this absurd supposition; but a man who has read Ten Brink ought once for all to have cleared his mind of it. In 1358 Chaucer was eighteen years old. Does Dr. Rodenberg imagine that the *Assembly* is the work of a boy of eighteen? Moreover fifteen stanzas of it, essential to the harmony of the piece, are translated straight from Boccaccio's *Teseide*, and we have no evidence of Chaucer's having known the *Teseide* till after his visit to Italy in 1372. Again, with regard to that visit, Herr Rodenberg has no suspicion that the words of the Clerk of Oxenford about the meeting with Petrarch are not to be accepted as literally true of Chaucer himself. If he had read his Ten Brink carefully, or indeed any other book than *Chaucer's England*, he would have known that Petrarch did not translate Boccaccio's story of Griselda into Latin till after Chaucer had returned to England, so that the theory of a literal interpretation falls to the ground. But that matters nothing to Herr Rodenberg; he must make his Chaucer picturesque at any price—in his youth, a wanderer in the glades of Woodstock; in middle life, drinking in inspiration from the lips of Petrarch; in his old age, "struggling with debts and creditors." As to this last, it is not unlikely that Chaucer was poorly off in his later years, but Herr Rodenberg is talking without book when he says, "In the year 1391 we again find him without office and almost without means; and so he remained till the last year of the century and of his life." As a matter of fact he was pensioned again in 1394. But that would interfere with Dr. Rodenberg's conclusion, and still further disturb his metaphors:—

> But now his God-graced nature, sunny in its deepest depths, showed itself, which no earthly trouble could darken; for in these thirteen years, like the nightingale singing in the night, he produced his great poem, which, borne from century to century, belongs to the world's literature as it opens that of England.

Happy Chaucer, dowered with a true poet's versatility! In one and the same moment he is a valley illuminated by the sun and a nightingale that sings in the night. Polonius would have called that "good."

But we must leave Chaucer, and see what may be discovered of other English matters, literary and social, from this "German point of view." "Shakspeare's London" is the title of the next essay, and, while it keeps to London, it is not bad. Old St. Paul's is described with an eye to effect, to say the least of it, though we very much doubt whether the description would stand the test of truth. The author is properly enthusiastic about the "silver Thames" of Shakspeare's day, and about the gardens and houses of the great families; though it is a little hard upon the unimpeachable respectability of Norfolk Street and Essex Street to say that the place of those houses is now occupied by "the maze of dark courts and *ill-famed side streets* of the Strand." The Guildhall is not in Cheapside, nor is Bevis Marks in Aldersgate; nor, when speaking of the City, inside Temple Bar, is it quite accurate to talk of an emigration "westward towards Fleet Street." Cheapside Cross, we read, was "destroyed in 1643 by the Puritans, as was also Charing Cross, *which has, however, received the popular designation of Trafalgar Square*." The Cross was first destroyed, and afterwards called the Square! These, however, are but the peccadilloes of a foreigner; we can forgive them in the presence of such an appalling statement as this:—

> It is said that Shakspeare made the acquaintance of Sir John Oldcastle (for so the original of our admirable friend Sir John Falstaff was called) in a tavern in Eastcheap, the "Boar's Head."

What would Mr. Halliwell say to that? It is, in fact, a typical instance of the confusion of which the book is full. The author has heard somewhere that in the original draught of the play Falstaff was called Oldcastle, and that Oldcastle was an historical character. But he has not heard that the real Oldcastle was burnt for Lollardism in Henry IV.'s reign, and that his memory, distorted by the misrepresentations of churchmen, survived in the popular mind as that of one who was partly wizard, partly butt, and partly buffoon. Nothing was more natural than that Shakspeare should work up such a character in his play, and even, till "offence was worthily taken by certain persons descended from Oldcastle's title," that he should give it the name of Oldcastle; but it is giving a little too much credit to the wizardry of the great Lollard to assert that he appeared bodily to Shakspeare, in a tavern in Eastcheap, at the end of the sixteenth century.

We may leave unnoticed the not very original, but still readable, account of the Jews of London, and what the author has to say of Dr. Johnson and of the clubs where English people "dine off silver and Wedgwood." We may in like manner pass over the stories of English highwaymen, supported by appeals to *Henry* Taine's *History of English Literature*. The last of the essays is called "Autumn on the English Lakes," and for this, with all its blunders and all its sentimentalism, we will, as true lovers of the Lakes, give the author a word of thanks. It is indeed a little painful to the genuine Lakist to be told, in the middle of an account of Windermere, "Here by this lake and under these hills was Wordsworth born, here Southey settled and Coleridge sung." Wordsworth was born at Cockermouth, and Southey settled at Keswick; but these are details which may fairly have been invisible from a "German point of view." A good pair of eyes, however, would have saved Herr Rodenberg from calling that highly respectable Georgian dwelling-house, Rydal Hall, "an old castle," or from talking of the waterfalls "running and roaring *from the granite*" of Kirkstone. In a chapter headed "The Lakes of Cum-

* *England, Literary and Social, from a German Point of View.* By Julius Rodenberg. London: Bentley.

berland" we expected to hear of a little more than Ullswater, half of which, by the way, is in Westmoreland. Readers of Wordsworth will hardly think it an adequate account of the islets in Windermere to call them "bouquets of flowers in porphyry vases." Even less will they be inclined to agree with the author when he tells them that the Lake poets not only freed English poetry from the formalism of Pope and Dryden, but "*prepared the way* for the great romancists Byron and Scott." But still he says the right thing about Wordsworth's grave, and our last extract from his book shall be one of which all who in London have remembered Westmoreland must feel the truth:—

> My heart is full of a sorrowful joy when I think of those days [illegible] and golden, so sunny and so quiet. Here and there, when I sat myself down by that English lake, on one of the mossy stones under the thick elm trees, in the balmy air of the morning, I had a reading; and it little had no perception to offer than such a measure of bliss and interrogation and absorption in nature. Then speaks the spirit in us with that spirit which blows in the bloom and whispers in the whisper of the wind.

CLOUGH'S EXISTENCE OF MIXED LANGUAGES.*

We dealt a few weeks back with a Fellow of the Royal Historical Society, who veiled his fellowship under mysterious letters. Here is another member of the same body, who gives his description in full, and who is further "Member of the English Dialect Society; Assistant at Huddersfield College; Late Modern Master at Liverpool College." Our heart would indeed be thinly if we did not sincerely pity those among the youth of Huddersfield and Liverpool who have or have had to get their notions of some important matters from the present Fellow of the Royal Historical Society. We have no very clear idea as to the duties of a Modern Master"; but we guess that teaching at least the elements of English history may be part of them. Let us try Mr. Clough on that head. Here is a specimen:

> With the Conqueror's reception [illegible] to accept the entire and the Anglo-Saxon [illegible] and some property on the distinctive [illegible] of that nation [illegible] course. He issue forced a [illegible] as that:—
>
> 1. The [illegible] said employ no but are [illegible] French
> 2. No [illegible] the State or Church's [illegible] legal [illegible]
> 3. [illegible] should be the medium of communication at schools.
> 4. In [illegible] [illegible] would be [illegible] as the savior who pleaded in Anglo Saxon, as that [illegible] deathering and
> 5. All [illegible] documents in Anglo Saxon were declared invalid.

Now this is the kind of thing that takes away one's breath. It is hard to believe that [illegible] these, put forth with such daring assertion and drawn up as if they were extracts from a legal code, are pure fiction and nothing else. Yet so it is: we need not waste words on proving that so it is; everybody who has the faintest knowledge of English history in the eleventh century knows that every word of Mr. Clough's five elaborately drawn propositions is simply fabulous. Whether Mr. Clough devised them for himself or copied them from anybody else we neither know nor care. No doubt the false Ingulf is at the bottom of it all; but Mr. Clough's romance stands to the romance of the false Ingulf in much the same relation in which the romance of the false Ingulf stands to the true history. The Crowland forger, to do him justice, was not nearly so daring in his fictions as the Modern Master of Liverpool College. We do not remember to have ever seen five indefensible statements together in which it is so absolutely impossible to find even a kernel of truth. It is not mere blundering or confusion or misconception; the meaning of each of Mr. Clough's five articles is clear enough; only every one of them is, as we said, pure fiction. William never ordered any one of the five things which Mr. Clough says that he did order. He himself tried to learn English. English alternates with Latin as the language of his public documents; not one of them is in French. No one doubts that French did at that time largely displace English for many purposes; but, so far as it did so, it did so wholly by the natural working of the circumstances of the time, not at all by any legal enactment.

We might, after this, perhaps not unfairly dismiss Mr. Clough altogether, as one who, after such a display as this, is not entitled to a hearing on any matter. We might say, Go back to your Orderic, your Domesday, your Schmid or your Thorpe; turn over your Monasticon; go to the Guildhall of London city, and study the two precious documents of William's day that are there to be seen: and when, by the help of all this, you have learned the A B C of the matter in hand, we may listen to you again. But there are two reasons why we may fairly give Mr. Clough a little more space. First of all, his whole book is not on the same preternatural level of ignorance as this particular passage. Mr. Clough knows more of language itself than he knows of the history of language. His book contains a good many positive mistakes, even in dealing with language proper. We do not see that it contains any new thoughts or new facts. Mr. Clough has clearly not reached the stage which justifies him in acting as a teacher; but he plainly is, in a certain sense, a student. His book is evidently the result of a good deal of mere work, while his new "Leges Willelmi" can have been the result of nothing but an unlucky divination. Secondly, though his whole argument is throughout a fallacy and a misconception, though he clearly does not understand the meaning of the eminent scholars with whom he has so unwisely matched himself, yet the state of mind of a man who, with a certain knowledge of facts, is so wholly incapable of using his facts, is in itself a curious study. We know pretty well what to expect when people begin sneering at "the German school"; but to this favourite formula Mr. Clough adds "the modern school," which does not seem to be so acceptable as one might have expected to a modern master. The chief enemies for whose discomfiture Mr. Clough labours are Professor Müller and Dr. Morris. Their chief offence seems to be having denied the possibility of mixed languages. Mr. Clough is very certain that there are mixed languages; above all things is he certain that English is a mixed language. And he is specially angry with anybody who ventures to agree with King Alfred in thinking that the language which he spoke was English. Not at all: there was no English till the twelfth century, when that mixed language arose out of the mixture of Anglo-Saxon and Norman-French. Now we are not aware that Professor Müller has said anything on this last head, though Dr. Morris has said a good deal. Professor Müller has indeed said that English, notwithstanding all foreign infusions, is still essentially Teutonic; but in no part of his writings that we remember has he gone into any controversies as to the nomenclature of the English language. As, therefore, Mr. Clough mentions those two writers, and as we think he does not mention any one else, we suppose that what he disputes against is a general principle laid down by Professor Müller and carried out in a particular application by Dr. Morris. We have all the old fallacies about the number of words in dictionaries, with a new fallacy of Mr. Clough's own:—

> To be perfectly fair in these statements no word ought to be counted twice over in the same passage. This would reduce the Teutonic element considerably; for the preponderance is often more apparent than real from the constant repetition of such words as *of, the, a, an, in, on, upon, and, if, but, to, this, that*, &c.

Does not Mr. Clough see that the fact that there are certain words which we cannot write or speak without using over and over again proves that those words are the real essence of the language? French, notwithstanding a large Teutonic infusion, is still Romance, because the words of absolute necessity are Romance. English, notwithstanding a still larger Romance infusion, is still Teutonic, because the words of absolute necessity are Teutonic.

Those who argue in this way are "Teutonists," a "German school," a "modern school." A more excellent way may be learned from Mr. Clough:—

> The indirect influence of Latin, in the form of Romance or Neo-Latin, on the language of our Teutonic forefathers has been immeasurable. Under it Anglo-Saxon became a dead language, or, to put it more correctly, the union of Anglo-Saxon with Norman French produced that Anglo-Romance language we call English; hence the propriety of reserving the term "Old English" to the oldest form of this mixture, instead of using it, with the German school, as synonymous with Anglo-Saxon. If it had not been for the Normans we should have remained Germans; if William the Conqueror could have had his way, we should have become Frenchmen; but, thanks to the Norman invasion on the one hand, and to our Teutonic stubbornness on the other, we are neither one nor the other, but English.

After all then we had Teutonic forefathers and Teutonic stubbornness, which is some comfort. But mark the confusion of the word "German." Till we get a definition of it, we cannot say that we are or ever were "Germans" or that we are not. In the sense which the word most commonly bears, we unhesitatingly say that we are not Germans and never were. But the notion that the Norman Conquest turned Germans into English would have seemed very strange to the men of the eleventh and twelfth centuries, and to none stranger than to the great King who, instead of trying to turn us into Frenchmen, did what little he could, under his very unfavourable circumstances, to turn himself into an Englishman. Now, as for "Anglo-Saxon" becoming a "dead language," here again are misleading expressions. What is a "dead language?" Many people would call Greek a dead language. Yet no language is more truly living. It has changed very greatly, but there is no break between its oldest and its latest form. So it is with English; its oldest form, like the oldest form of every other existing language, is now unintelligible without special study. But there is no break between the oldest form and the latest. In the case both of Greek and of English the personal identity of the tongue has been kept on through all change. It has taken in a vast number of foreign words and even of foreign idioms; but that does not affect the unbroken existence of the language. To say that a new language called English was formed by the mixture of two others is simply historically false. The great period of change in the English language, the time when English was most affected by French, takes in the twelfth, thirteenth, and fourteenth centuries. But, at any moment within those centuries, there were two tongues side by side, English and French, known at any moment by those names. English was largely affected by French; French was in a less degree affected by English; English in the end displaced French. A distinct tongue with—so to speak—a personal being of its own displaced another tongue with another personal being of its own. But there was no time when a tongue called English displaced another tongue called Anglo-Saxon. Very great changes were made in an existing language; but there was no change from one language to another, no substitution of one language for another.

This is, we conceive, pretty much what Professor Müller and

---

* *On the Existence of Mixed Languages; being an Examination of the Fundamental Axioms of the Foreign School of Modern Philology, more especially as applied to the English.* Prize Essay by James Cresswell Clough. London: Longmans & Co. 1876.

Dr. Morris mean when they say that there is no such thing as a mixed language, and when they specially deny that English is a mixed language. They mean that those languages which have received the greatest infusion from foreign sources—modern English for instance, or modern Ottoman Turkish—were not formed as something new by mixing two or more equal elements, but that the foreign infusion came in bit by bit into a previously existing tongue, changing its character in many ways, but in no way changing its personality. Supposing that in the modern Turkish vocabulary the Arabic and Persian words outnumber the genuine Turkish words; supposing that, along with the Arabic and Persian words, many Arabic and Persian idioms have come in, still they have all come in; they have been received one by one; they have been adopted into an existing body; they have not joined with other elements to form a new body. There was no time when mixed Turkish was substituted for unmixed Turkish, any more than there was a time when "English" was substituted for "Anglo-Saxon." The case of Greek, to which we referred just now, is not quite parallel; that of the Romance languages is still less so. It would be easy to point out several important differences between their development and the development of modern English; but one is enough for our present purpose. Modern English never supplanted Old-English; French, though it grew out of Latin, did, for some purposes, actually supplant Latin. There was no time when what Mr. Clough calls "English" and what he calls "Anglo-Saxon" existed side by side in England as written or spoken languages; but from the tenth century Latin and French have existed side by side in France. To point out all the analogies and all the differences between the two cases would need a long essay; but here is one of the most important.

This, then, we take to be what the two writers whom Mr. Clough argues against mean when they say that there is no such thing as a mixed language. It is at any rate what we should mean by saying so. The process which formed modern English or modern Turkish is not the production of a third language by the mixture of two; it is simply the modification of one language by another, both continuing to exist, and no new language taking the place of either. Mr. Clough clearly does not understand the true nature of the points against which he is arguing, when he thinks that it proves anything against the points of Professor Muller and Dr. Morris to show how very large the foreign infusion is in certain cases. Mistaken as his argument is, he shows more knowledge of detail than could have been looked for in company with such an astounding exhibition as that with which we began. But there are some odd things too in the purely philological way. We will take two or three only. Every one knows that in Old-English there were many ways of forming the plural, of which that in *s*, one of the most usual, perhaps the most usual, has in modern English all but driven out the rest. This is in Mr. Clough's eyes a sign that our grammar is mixed. His saying on the matter is curious:—

> The Anglo-Saxon way of forming the plural has already been mentioned. The usual form was in *-a* or *-u*, as the *plural* is *represented by an irregular declension of but few words*. The Romance plural is as from the characteristic consonant in the Latin plural dative, accusative, and ablative, and *from the French has been adopted into English*. Thus every word of Saxon origin in our language may be regarded as a hybrid when changed into the plural in *s*, e.g. *lads, thanes, tubs*.

One of the surest signs that our grammar is not mixed is that, when we adopt a foreign verb, we still inflect it as if it were native. In this Mr. Clough strangely sees a sign of mixed grammar:—

> Verbs are usually the most conservative words of a language, and in English they present no exception to this general rule. Nevertheless Norman French influence can be traced even here. Thus every verb of foreign root is not only a hybrid, but also a mixture of grammar when added to a Teutonic inflection by way of conjugation; thus, *transcrib-est, transcrib-eth, transcrib-es, transcrib-ed, transcrib-edst, transcrib-ing*.

Lastly Mr. Clough tells us that "the double negative of the Londoners is also regarded as a French innovation." Now every one who has read the Chronicles must know that the double negative is as familiar in Old-English as it is in Greek, while in French there is, in grammatical strictness, no double negative at all.

Certainly neither Professor Muller nor Dr. Morris need fear the upsetting of his facts or his arguments by the late Modern Master of Liverpool College.

EMERSON'S LETTERS AND SOCIAL AIMS.*

THERE are people, we believe, who complain of Mr. Emerson's writing that it is fanciful and rambling, and does not teach one anything in particular. This comes of want of knowledge or want of understanding—of want of knowledge, inasmuch as such objectors must be ignorant of the true nature of the Essay, of the beginnings of essay-writing, and its proper place in literature; of want of understanding, inasmuch as they plainly cannot tell what is good for them. Historically speaking, such caprices as Mr. Emerson allows himself are more than abundantly justified by the example of the father of Essays, whom he has avowedly taken for one of his favourite authors. Many writers have rambled well or ill in the last three centuries, but none has ever come near to the rambling of Montaigne. Mr. Emerson's flights and digressions are nothing to it, though in the general shaping and conduct of an essay he is less remote from that first exemplar than most modern writers. As to the other point, one might ask those disappointed ones who profess to come away empty, what it really was that they went out to find? Do men expect to gather rules and propositions from the shining of the sun and the running of water, or to come home stored with axioms from a walk on the first fine day of spring? But instructive discourse, in the minds and mouths of not a few who might know better, stands not for that which makes a man wiser or happier, but for that which gives him certain words and sentences which he may conveniently repeat without understanding them, and thereby seem the wiser to others. And it must be confessed that in this last kind of instruction Mr. Emerson's writings are sadly poor, indeed merely bankrupt. The hucksters of moral commonplaces would vainly try to draw upon him for any of the cut-and-dry smatterings which are the capital of their trade. His work is not of the stuff that one can clip neat patches from. The matter and the form are inseparable, as one finds them in the best talk. One tries to write down afterwards the points and sayings of a brilliant converser, and finds them shrunk and brivelled in the process. There was something in the talk itself that would not be fixed, and the written note is only useful in the way of association, as a spur to memory and a token to call back the living charm. Those short words of Dr. Johnson's, "Sir, we had good talk," express a high form of happiness; yet how difficult it is to show the grounds of the assertion when it is met with the most natural question, as it seems, "And what did you talk about?" So it is when we read Mr. Emerson at his best. He produces the effect of conversation rather than of literature; his thoughts are spoken out for the stirring of kindred thought rather than written down for learning.

One could hardly expect, of course, to find in this volume the full vigour of Mr. Emerson's former work. It makes, however, a pleasant companion to that which he gave us a few years ago under the name of *Society and Solitude*, and stands pretty much on the same footing. The enthusiastic and almost mystical ardour of his earlier essays is softened into a more genial and equable mirth; but if he sometimes walks where he would once have soared, his path tells not to be illuminated by the same bright and far-reaching imagination as of old. More than once in this book he shows himself eminent in one branch of imaginative faculty which is much to be prized in these days and of whose rarity one hears or is disposed to utter complaints: the faculty, namely, of assimilating some way of the world which results from modern work in philosophy, science, and expounding it in a gnomic or poetical form which gives it the literary stamp, and lends it on as a possession for the world of letters and culture. This is a thing which men of science may do, and in fact often do very well: but they do it, not as belonging to their own work, but in so far as they are also men of letters and culture; and it is a task in which they may justly call on pure literature to meet them half way. Here is one example, a sentence short enough, and leaning towards paradox at first sight, but in truth the clarified and crystallized result of we know not how much discussion of the theory of perception, the formation of general ideas, the growth and uses of language, and the like:—"The world is thoroughly anthropomorphized, as if it had passed through the body and mind of man, and taken his mould and form." Where he found a number of conclusions and hypotheses belonging to more or less special branches of knowledge, and expressible in more or less technical terms, Mr. Emerson has left a universal and portable aphorism. The desire of putting things in a summary way is indeed not without its dangers. Few general propositions, at least in such matters as these essays deal with, can safely be taken without a grain of salt; but there are some here which would leave none to spare for their neighbours, and yet never be seasoned enough. "Observe that all poetry is written in the oldest and simplest English words," says Mr. Emerson, meaning to give a precept in itself thoroughly sound—namely, to use the old and simple words when there is no special reason for using others. But where shall we observe what he bids us? Not in Shakspeare and his fellows, revelling as they did in richness of word-store; certainly not in Milton, certainly not in most of our living poets, and not easily in those of the generations between. Chaucer and Wordsworth are the only two names of the first rank that give any solid support to Mr. Emerson's proposition, and even they not without drawbacks. Again, Mr. Emerson denies offhand that beasts or birds do anything ridiculous. We are loth to believe either that kittens and puppies never play in America, or that, if they do, it is thought unworthy of a wise man to laugh at them. And, besides these familiar instances, there are certain animals which have been not unaptly said to be made for fun—"cheerful queernesses," as George Eliot's poem calls them. A little further on Mr. Emerson excellently says that "the perception of the comic is a tie of sympathy with other men, a pledge of sanity, and a protection from those perverse tendencies and gloomy insanities in which fine intellects sometimes lose themselves"; and we do confess that we should somewhat mistrust, if we knew no more against him, the fellowship of a man who could stand wholly unmoved at the sight of the penguin or the armadillo. There is another curious assertion, though not a general one, about poets:—"Shakspeare, Milton, Wordsworth, were very conscious of their responsibilities." As to Wordsworth this rests on ample proofs; as to Milton on proofs enough; but as to Shakspeare one might seek a long while. The fact is that in this passage Mr. Emerson almost lays down consciousness of a sort of prophetic gift as one of the things needful for a

* *Letters and Social Aims.* By Ralph Waldo Emerson. London: Chatto & Windus. 1876.

great poet, and so he could not anyhow leave out Shakspeare. But, after all, no harm can be done by large statements thrown out in this manner, save to those who bring it on themselves by taking for dogmas what are given as hints. The end of writing of this kind is to make people look and think for themselves, and it is then not least successful when it excites a critical reaction in the reader's mind.

Another quality which plays a large part in the wholesome and stimulating effect of Mr. Emerson's discussions is his constant freshness—a word which we use rather than originality, not only because it is plainer and shorter, but because one of the essays in this very book expressly undertakes to show that originality, in any strict sense, does not exist, and would be a very poor thing if it did. The distinction between fancy and imagination had been wholly worked out, as one would think, in Wordsworth's well-known exposition; but we find here a couple of brilliant paragraphs which lose nothing by coming after Wordsworth. How threadbare, again, are the uses of friendship as a topic for essay-writers! yet even on this Mr. Emerson has a word to say that we are glad to hear. The true friend is "somebody who can make us do what we can." A like idea is developed in the essay on "Inspiration," where he justly speaks of conversation as the right metaphysical professor and the true school of philosophy. One often has occasion to notice how strong the historical sense is in cultivated Americans, how frankly they regret the want of monuments and antiquities. But it has been left for Mr. Emerson to strike out a delightfully novel consolation:—

We confess that in America everything looks new and recent. Our towns are still rude,—the make-shifts of emigrants,—and the whole architecture tent-like, when compared with the monumental solidity of mediæval and primeval remains in Europe and Asia. But geology has effaced these distinctions. Geology, a science of forty or fifty summers, has had the effect to throw an air of novelty and mushroom speed over entire history. The oldest empires, what we called venerable antiquity,—now that we have true measure of duration, show like creations of yesterday. 'T is yet quite too early to draw sound conclusions. The old six thousand years of chronology become a kitchen clock,—no more a measure of time than an hour-glass or an egg-glass,—since the duration of geologic periods has come into view.

In personal affairs it is indeed a commonplace of comfort that life is short at best; but the application of it on this grand scale almost an invention. That the writer himself fully shares the historic feeling and rejoices in the historical associations of civilization is shown by the language he holds elsewhere of the middle ages:—

In modern Europe, the Middle Ages were called the Dark Ages. Who dares to call them so now? They are seen to be the feet on which we walk, the eyes with which we see. 'T is one of our triumphs to have reinstated them. Their Dante and Alfred and Wicklif and Abelard and Bacon; their Magna Charta, decimal numbers, mariner's compass, gunpowder, glass, paper, and clocks; chemistry, algebra, astronomy; their Gothic architecture, their painting,—are the delight and tuition of ours.

Yet Mr. Emerson sometimes passes for a mere visionary with those who have never really read him, and who also call him sentimental. Those who still have to learn the difference between sentiment, the truth, and sentimentalism, the falsehood, will find it perfectly set forth in a passage near the end of the essay on "Social Aims." On our side of the Atlantic also we have too many talkers whom Mr. Emerson's words will fit:—"They adopt whatever merit is in good repute, and almost make it hateful with their praise. The warmer their expressions, the colder we feel; we shiver with cold."

We might go on collecting and commenting much longer, and we had noted various points of which we have said nothing. But we choose for further mention only one somewhat remarkable matter of opinion. It is commonly thought in this country that the increase of reading and writing and cheap newspapers has much abated the importance of public speaking; and it has been openly said that the only use of speeches in Parliament nowadays is to be reported for the satisfaction of the constituencies. Mr. Emerson takes an entirely different view:—"If there ever was a country where eloquence was a power," he says, "it is in the United States," where the case for writing as against speaking is even stronger than it is here. He defines eloquence, however, as "the power to translate a truth into language perfectly intelligible to the person to whom you speak," which, as making no provision for style, may be thought too wide.

To say anything of Mr. Emerson's own style is at this time needless. Like his thought, it is all his own, and suits him. But the use of one or two words calls for notice. We find "socialist," in a good or neutral sense, for one who studies the wants of society; this is better than the barbarous "sociologist," but why not keep "politics" and "politician" in their old extensive meaning? And to one phrase we must take distinct exception; "a great style of hero" is one of the bad sort of Americanisms against which we are bound to protest to the last, even when they come to us under cover of Mr. Emerson's authority.

CHESS.*

IT is a well-known remark that imaginative poetry is the expression, in a veiled and figurative manner, of those emotions which have been debarred by the force of circumstance from their natural and primary expression in the world of reality. In a similar manner it may be said of chess, that it is the mode in which the intellectual temperament of a military strategist expresses itself when debarred by circumstance from the opportunity of exercising itself in its primary manner of directing the movements of armies. A chessplayer is, if we may so put it, one-third of a general. A great general must have three qualities in strong development—bodily vigour, strength of nerve, and strength of intellect. A great chessplayer need not have bodily vigour at all; and though no man can quite get along without nervous power, this quality is much less needful, we should say, for a chessplayer than for a whist-player. For it is the unforeseen strokes of chance that try the nerves most keenly; and chance has a large field in whist, but a very small field in chess. But intellectual strength in its highest development can find ample room and scope for itself within the limits of the chessboard. Indeed, if we except the higher mathematics, we hardly know any form of human effort which equals chess as a test and measure of pure brain-power. It is one of the very few employments in which the human understanding is exercised in a simple unadulterated form, and physical and moral qualities sink into a subordinate position. It is of course apparent from this that serious labour is needed for a man to become a great chessplayer; and while the friends of chess have argued from this that it ought to be elevated to the rank of a science, its enemies have argued that at any rate it must be excluded from the sphere of amusements. But, to our mind, neither of these estimates is right. Chess is intrinsically an amusement, a relaxation; it is a diversion of the mind from the cares and troubles of life; it may sometimes happen, but it is an absolutely unnecessary consequence, that it should exhaust the mind which is exercised on it. The mental toil of a chessplayer, like the bodily toil of a cricket-player, is within due limits a source of refreshment and not of fatigue. The real value of chess, as of all amusements, lies in its supplying food for certain faculties which are capable of being exercised at times when the other faculties need repose. Moral tension is put off for a season and the brain is improved. On the other hand, to reckon chess among the sciences is to forget that every science is a link in the great chain of universal knowledge, and is connected by a thousand subtle ties with the other links of that chain. This is emphatically not true of chess; its value is simply in its reflex, not in its direct, results; an evident gap severs it from the world of reality.

We have before us a fascinating and beautiful treatise on this game, entitled *Chess: Theory and Practice*, by the late Mr. Howard Staunton, well known in his day as the first of English, and almost of European, players. Of such a work it is almost needless to say that it brings the student of chess up to the latest discoveries in the theory of the game, according to the estimate of the most competent judges. It is also noticeable for an historical account of the rise and development of chess, characterized by greater fulness than any similar account that we remember to have seen. Chess, according to Mr. Staunton, has been practised for a length of time, and over a portion of the earth's surface, quite without parallel in the case of any other game, and almost unrivalled in the case of any human art whatever. Dr. Forbes, we are told, "has discovered in Hindoo literature, dating three thousand years before the Christian epoch, the description of a game which manifestly represents, in a primitive form, the modern game of chess." It has been played from time immemorial, not only among the Hindoos, but among the Arabs, Persians, and Chinese. "Under the celebrated Caliphs of Bagdad"—our old favourite Haroun-al-Raschid among the rest—"the game flourished to a degree almost unexampled." Among great conquerors, Timur was an enthusiast for chess, and bestowed conspicuous honour on the players of it. The chessmen of Charlemagne are still preserved in the abbey of St. Denis. "Much that is interesting," remarks Mr. Staunton, "might be said if there were space in this sketch to say it, on the present condition of the game in Abyssinia, Syria, Arabia, Egypt, Persia, Hindostan, the islands of the Pacific, China, and other parts of Asia." It may be supposed that within these wide limits of space and time some variations have taken place in the manner of playing; these are duly noticed by Mr. Staunton, and problems illustrative of them are given from the Arabic and Persian authorities; but, on the whole, they are very slight. Let it be considered what vast differences have taken place in the development of almost every other pursuit or faculty of man during much smaller intervals—in language, music, architecture—and the phenomenon in question will appear a curious one. A story illustrative of one of the Persian problems (in which the Bishop can move only to the third square along the diagonal in any direction, but can spring over an intervening piece—a custom still preserved in Abyssinia) is quoted by Mr. Staunton, and is so pretty a one that we reproduce it here:—

Two Persian princes were playing at chess, and the one who had the White men offered his favourite wife, Dilaram, as his stake upon the game. The contest had nearly reached its end, when the player who had risked the lady on the issue was threatened with checkmate next move, unless he could find some remedy. As he hesitated in the agony of despair, Dilaram, who had eagerly watched the combat from behind the screen of gauze which separated male from female in Eastern households, cried out, "Sacrifice, O prince, your Rooks, and save Dilaram; forward with your Bishop and your Pawn, and with the Knight deal death!" The position which illustrates this favourite story is still known throughout the East as Dilaram's Mace.

The position in question is one of much ingenuity, though not

* *Chess: Theory and Practice; containing the Laws and History of the Game, together with an Analysis of the Openings, and a Treatise on End Games.* By the late Howard Staunton. Edited by Robert B. Wormald. London: Virtue & Co. 1876.

equal in difficulty to the generality of modern problems. It is observable that the military affinities of chess, on which we have commented, appear not only in the early legends as to the invention of the game (which represent it as invented to amuse the tedium of a besieged monarch, or of soldiers engaged in a difficult march), but in the names of the pieces. The King and the Knight speak for themselves; the Queen was originally the Farzin, the King's counsellor, and received her present appellation nearly eleven hundred years ago, from the Empress Irene; the Rook was the Roka or war ship of the Hindoos; the Pawn is connected with Podata, Pedes, a foot-soldier; the Bishop alone is of more uncertain derivation.

A comparison of the present volume of Mr. Staunton's with his *Chessplayer's Handbook*, originally published in 1847, will give a good idea of the progress of the theory of chess in the last thirty years. The most important novelties introduced during that time are three; first, the much greater development of the Evans Gambit; secondly, the defence, in the King's Bishop's Gambit, of the King's Knight being played to the Bishop's third square, by the second player, at his third move; and, lastly, the introduction of the "Vienna Opening," in which the first player moves the Queen's Knight out at his second move. Of these three changes the first-mentioned is by far the most important. The Evans Gambit is the most remarkable discovery made in chess during the present century; but, highly as it was esteemed in 1847, the brilliancy of this opening has received (through the labours of Messrs. Fraser and Mortimer and others) vast additional illustration since that time. In 1847 all that Staunton says of it is:—

> This ingenious and interesting variation . . . has deservedly attained a high degree of favour among players of all classes from the period of its introduction.

Far more glowing are the terms employed by him in the present volume:—

> Of all the openings of which chess is susceptible, the Evans Gambit is the most interesting. Its combinations are more varied and more beautiful, the opportunities it affords for brilliant attack and scientific defence are more abundant than in any other *début* yet invented.

Without questioning that Staunton is right here, we must confess that we regret to see that beautiful opening, the King's Bishop's Gambit, reckoned as inferior to any other mode of attack known in chess. And, in point of fact, when Staunton comes to deal with the King's Bishop's Gambit, he apparently considers it as even the most intricate of all chess combinations. For he says:—

> Upon no opening in the game of chess, not excepting even the famous Evans Gambit, have analysts lavished so much labour as upon the King's Bishop's Gambit. But as in commentaries upon some great classic the business of one annotator is to destroy the toil of his predecessor, so in ch openings every analyst endeavours to upset the conclusions arrived at before him. The result in the present instance is very perplexing. No one appears to have positively settled, even to his own satisfaction, whether this Gambit can be advantageously adopted by the first player. According to some authorities, the attack has the best of the fight; according to others, the superiority rests with the defence. The main cause of this uncertainty is the inconceivable variety of combinations to which the opening gives birth. A volume of considerable magnitude might be filled indeed with the variations springing from the first half-dozen moves.

But in point of fact the new defence of the King's Knight to the Bishop's third square in this Gambit has tended rather to obscure than to increase its lustre. The classical defence, or rather counter attack, in which the second player's Queen checked at the third move, was striking in the highest degree, because it presented the spectacle of a double attack of the sharpest kind going on, each side being more engaged in assaulting his adversary than in defending himself. Nor is it yet ascertained that this is not even now the best mode of defence in this Gambit. But the new defence is the "safer" line; less daring, less hazardous, and less beautiful. The "Vienna Opening," the third novelty in the theory of chess to which we have referred, is one of fair, but not of extraordinary, interest.

It is to our mind a surprising thing, considering the intellectual power that has been bestowed on the theory of chess, that what are termed the "irregular openings" should have been comparatively so little analysed. Indeed the term "irregular openings" may justly seem a misnomer; for why should the advance on both sides of the King's Pawn two squares at the first move be held to be so absolutely the rule as to make every other mode of beginning the game (with the exception of the Queen's Gambit) abnormal? And when it is considered that two of these "irregular openings"—namely, the Sicilian Game and the French Game—are by the best authorities held to be superior strategy on the part of the second player to the customary reply of King's Pawn two squares, the imperfect consideration that has been given to them seems more unaccountable than ever. There can, however, be no doubt that these openings are obtaining more and more notice; and they make it clear that chess theory has still a long era of expansion, before (if ever) it attains its final consummation. There seems really no reason for thinking that the Sicilian or the French opening will prove less fertile in interesting positions than what is held to be the regular game, numberless as the developments of this latter are.

Before taking leave of Mr. Staunton's book, we must call the attention of the editor, Mr. Wormald, to the only blot which impairs its merits; and that is, the extraordinary number of misprints to be found in its pages. It is to be hoped that these will be removed before another edition comes out. At present it looks as if the text had really not been corrected at all. As examples (though we have noted many more) we may instance the diagrams in pages 184 and 323, in the former of which the White Queen's Bishop's Pawn has no business to be on the board, in the latter the Black Queen's Knight is misplaced; the words "and Black resigned," in page 132, which clearly ought to be "and White resigned;" the similar words, "and Black wins," in page 136, which ought to be "and White wins;" and in page 134, at the 19th move of the White in Game VII., it is evidently the White Bishop, and not the White Pawn, that is intended to take the Black Bishop. This last is a misprint that might cause some perplexity; for it is not till the 28th move of the White that it can be conclusively shown to be a misprint. The game in question is one between De Labourdonnais and Macdonnell; and we have another reason for referring to it here, for the 23rd move in the game supplies, if we are not mistaken, an instance of an oversight rarely to be found in players of such distinction. The advance at that move of the White King's Bishop's Pawn gives Black an opportunity of forking the White Queen and Rook by planting his Knight at his King's sixth square. It is equally extraordinary that such an opportunity should have been given by Macdonnell, and that it should not have been taken by De Labourdonnais. After the best study we have been able to give to the position, we are unable to see how White could possibly have extricated himself after the loss of his Rook in exchange for the Knight, which would have been the inevitable consequence of the move that we have named. We commend the point to Mr. Wormald's attention. But, indeed, the whole game is somewhat carelessly played on both sides, and, except as an encouraging instance to tiros that even *bonus Homerus aliquando dormitat*, is hardly worthy of its position in the book. And, lastly, to give one more suggestion, if a few chess problems had been added at the end of the book, the bulk of it would not have been materially increased, while its interest would have been augmented. However, as it stands, the book is undeniably a very important addition to the literature of the game.

LETTERS AND PAPERS OF THE REIGN OF HENRY VIII.*

NEARLY three years have elapsed since we directed the attention of our readers to the important documents analysed in the second part of this ponderous volume of State Papers, ranging over the seven years from 1524 to 1530 inclusive. (See *Saturday Review* for May 24 and June 21, 1873.) We then expected to have an earlier opportunity of recurring to the subject of the divorce of Catharine of Aragon, which occupies so conspicuous a place in the complications of the history of the period. The second part of the so-called fourth volume, itself consisting of 1,200 well-filled pages, reached only to the end of 1528, and we were wondering how the papers of the remaining two years, down to the conclusion of 1530, could be squeezed, together with the editor's preface and the usual index, into a volume of any ordinary dimensions. But Mr. Brewer has solved this difficulty for us by issuing his Introduction to the period in a separate volume by itself. Accordingly the volume which we proceed to notice contains no documents or other additions to the Introduction, with the exception of six pages of appendix, in which the reader will find printed at length two letters discovered by Mr. Stevenson in the Vatican Archives, which came to hand too late to be inserted in their proper chronological order in the forthcoming and concluding part of this fourth volume. They are written in Italian, and almost entirely in cipher; but though they have for the most part been deciphered by the ingenuity of Mr. Gairdner, who has rendered such important assistance in the whole course of the publication of these State Papers, parts of them remain still unintelligible, as the deciphered words required again a second process of decipherihg, which rests upon mere conjecture, and other symbols have been introduced which it seems must be assigned to the head of *nihil importantia*, and appear to have been inserted merely to mislead any who should attempt to interpret them.

The Introduction to this volume then differs in one respect from the brilliant pieces of historical writing which have been prefixed to the three previously published volumes. It has anticipated the forthcoming and concluding part of the volume, and so we are obliged to take upon trust all the remarks that refer to the last two years of the period which ends with the death of Wolsey, November 29, 1529. We probably shall not have to wait long for the publication of the vouchers for those two years; and certainly we cannot affect to regret their temporary absence on any other ground than that the references to State Papers not yet published excite our curiosity with regard to documents which are evidently of the highest importance, and as yet entirely unknown in the literary world. Mr. Brewer has not only anticipated his own concluding part, but also tantalizes us by several allusions to a forthcoming volume of Spanish papers which will contain very curious matter, and the sheets of which have, we suppose, been submitted to his inspection as they passed through the press.

There are many points of minor importance—nay, perhaps some

* *Letters and Papers, Foreign and Domestic, of the Reign of Henry VIII. preserved in the Public Record Office, the British Museum, and elsewhere in England* Arranged and Catalogued by J. S. Brewer, M.A., under the Direction of the Master of the Rolls, and with the Sanction of Her Majesty's Secretaries of State. Vol. IV. Introduction and Appendix. London: Longmans & Co. 1875.

which will be thought to rise above that level—which the editor has been obliged to leave unnoticed. On affairs strictly ecclesiastical—the progress of the Reformation, the dissemination of Tyndale's translation of the New Testament, and the influence exercised over English minds by Tyndale's Calvinistic opinions, if a term involving such an anachronism may be allowed—Mr. Brewer is almost silent. Such topics belong to a later period, and he has done little more than point out what is so much forgotten, the difference between the Protestantism of Henry VIII.'s reign and that of his daughter Elizabeth. Neither shall we say anything more about the tenets of the men of the new learning during this reign, with the exception of reminding our readers that the *Lutherianism* which statesmen and ecclesiastics so much dreaded was for the most part merely a form of Zuinglianism which Luther would have disowned with the same impetuosity with which, a few years before, he had attacked the indulgences offered for sale by the Dominican friar Tetzel.

The salient points of history discussed in this Introduction are of course the capture of Francis I., the sack of Rome, the divorce of Catharine of Aragon, and the fall of Wolsey. The first two of these subjects relate to the documents in the two previously published parts of the volume which we have already reviewed, and accordingly we pass on to the last two. As regards the former of these, we may observe that there is now before the world, or at least will be as soon as the next volume of the Spanish Calendar appears, and Mr. Brewer has completed the third part of his fourth volume, all that will ever be known of the commencement of the history of the divorce. On the precise date of the origin of the King's scruples about his marriage the editor wisely declines giving an opinion, confining himself to the observation that it could scarcely have been known to the King himself. The earliest allusion in point of fact made to it in any original document is the expression "istud beneficium divortium" in Clerk's letter to Wolsey from Paris, dated September 13, 1526. These words, which imply that negotiations of some kind had taken place in the matter, are sufficient in themselves to destroy the fiction which has so long passed current among historians of the period, that the idea of the illegitimacy of the Princess Mary was first put into the King's head by the Bishop of Tarbes, when projects for her marriage with Francis were being entertained. The date of this letter is several months prior to the arrival of the Bishop in England. So the King's scruples did not originate in this way. Neither is it in the least likely that any such objection was ever raised, as, if it had been, it would most certainly have been referred to in some of the documents in this volume. It seems to have been a pure invention devised by Wolsey and the King in order to give some colour to subsequent proceedings in the case of the divorce. It is, however, conceivable, though in the highest degree improbable, that the Bishop of Tarbes may have heard of the King's pretended scruples, which began about this time to be talked about; the chief difficulty in denying the truth of the whole story consisting in the improbability of the King and Wolsey inventing it and venturing to propagate it, supposing it to have no foundation whatever. The story of the suggestion coming first from Wolsey through Longland, the King's confessor, Mr. Brewer thinks is entitled to as little credit, though the denial of it by the King and the Cardinal in the legatine court is by no means conclusive of the point. Longland's denial of the accuracy of this statement is worth very little more, and, though stated by Harpsfield in his MS. treatise (Lyston Copy, Book ii., p. 94) it evidently was not deemed by him to be at all conclusive on the matter. Who originated it, it may not be easy to say, but it was industriously propagated by two of Wolsey's bitterest enemies, Tyndale and Polydore Vergil.

It is from this point that Mr. Brewer begins his masterly analysis of the infamous plot conducted by Henry and his cunning paramour, Anne Boleyn, assisted by all the diplomatic power of the Cardinal and the cringing assiduity of others whose interest it was to side with the King against a defenceless woman whose misfortune was that, of all the five children she had borne to the King, a daughter only survived to inherit his crown. Not that we hear much of the convenient plea of expediency that there was no male heir to the throne. This plea, indeed, appears in its proper place, as urged by the King and his counsellors as a reason why the Pope should annul the dispensation for the marriage of Henry with Catharine. But, unluckily for Mr. Froude and the theory of self-sacrifice for the good of the nation—unluckily, too, for the apology for the King in the misfortune of all his relations with women—the whole story of the infatuation for Anne Boleyn, with all the lying, the diplomacy, the chicanery, and effrontery which were brought to bear upon the case, is detailed in the clearest way, and the vouchers for the whole story are to be found by looking into the documents, from the facts of which there is no possible escape. It would have swelled the volume to an inordinate size if its editor had gone minutely into many of the circumstances which still further aggravate the case. He has wisely abstained from many particulars which would have strengthened an argument which is entirely complete without them. And so we have here no discussion of the subject of the virginity of Catharine when she married her second husband, and no defence of the genuineness of the breve which no one can any longer doubt was really issued by Pope Julius II., the allegation of which formed so important an element in the trial. And, again, the connexion of the King with Anne Boleyn's elder sister Mary is only cursorily referred to. In the mass of materials ready to his hand it must have been difficult for Mr. Brewer to make his selection, and so interesting is the whole story that we can only regret that he had to make a selection. For these and other points into which he was precluded from entering possess almost as much interest as those which he has dwelt upon in his endeavour to illustrate the characters of the chief actors in the drama. Of course the principal actor in all the transactions of the first twenty years of the reign was the great Cardinal of York, but of him we must take another opportunity of speaking. He is the real hero of the volume, if what is history, and not fiction, can be said to have a hero. And if Mr. Brewer's estimate of Wolsey is altogether different from those of previous historians, it is open to any one to criticize it with the help of the documents from the careful study of which he has drawn his picture.

As regards the King, he has drawn his portrait with considerable exactness, and undoubtedly he has not been tempted by the ridiculous and extravagant delineations of the character by Mr. Froude to go into the opposite extreme of undue disparagement. Indeed there is almost a parade of his better qualities, side by side with the dark traits which characterize nearly the whole of the period embraced in this volume. A Roman Catholic historian such as Dr. Lingard might well be excused for representing the deterioration of the character of the King as the consequence of the rupture with the Pope; but Mr. Brewer's volume has not reached that period yet, and there is enough of fraud and deceit and brutality detailed in this earlier part of the history to enable any one to judge how the passion for Anne Boleyn was gradually over-mastering all the better parts of his nature. To this change in the character of Henry we think Mr. Brewer has scarcely done justice in the remarks that he appends to the history of the appointment of the Abbess of Wilton in 1528, which had been made by Wolsey in opposition to Henry's declared wish. The very letter on the subject written by Henry to Anne Boleyn, alleging that he could not in conscience nominate a woman accused of ungodly demeanour, at the very time that he was contemplating, if not actually living in, an incestuous connexion with his mistress, shows with what hypocrisy he could express his abhorrence of wickedness; and it is no wonder, therefore, that he could put on the semblance of magnanimity in forgiving Wolsey for his transgressions, whilst the very same sentence is concluded with the words, "trusting hereafter you shall recompense that with a thing much more acceptable to me," *i.e.* the completion of the divorce from Catharine.

After quoting the material parts of both letters, Mr. Brewer continues:—

> It is strange that sentiments so generous, manly, and noble should have emanated from the same pen as the letters to Anne Boleyn. Stranger still is it, that side by side with convictions so admirable and so king-like of what was just, candid, and sincere, there should be found the most ignoble deceit, oppression, and falsehood wherever Katharine was concerned. Must we then think that the fountain sends forth at the same place sweet water and bitter? that, in mockery of our [illegible] notions of heroes and hero-worship, such is the frailty and inconsistency of human nature, such its defiance of all human rules and calculations?
>
> Chaos of thought and passion all confused,
> Still by itself abused or disabused!
>
> To none certainly were the poet's words more applicable than to Henry VIII. He was no saint, no hero; yet not without a manly sense of what was saintly and heroic, as his letter shows; and utterly free from the sickly religious sentiment and introspective Puritanism of later times.—P. cccxcii.

It is true that the sweating sickness was raging violently, and the King, who was daily making his confession, may by this time have half persuaded himself that he had right on his side; but it must have been a very seared conscience which allowed him to petition the Pope for a divorce from his brother's virgin widow in favour of the sister of a woman who had lived with him as his mistress. Yet *Nemo repente fuit turpissimus*, and he was still able to express himself in language which would better have become his younger years, when, whatever may have been his faults and excesses, he will at least bear favourable comparison with contemporary monarchs. Mr. Brewer is describing the King in his transition state. He has yet to chronicle the details of a life which, whatever other faults it may have been free from, was entirely under the dominion of cruelty, lust, and avarice.

The reader will perhaps expect something to be said of the Archbishop who completed this disgraceful transaction at the Court of Dunstable. But Mr. Brewer appears to treat Cranmer with the contempt which he deserves, scarcely noticing him except to excuse the nefarious proceedings of the Court which pronounced the final decision in the case, on the ground that the other judges of the day would have done the same. Perhaps so. But that will hardly satisfy the admirers of the memory of Thomas Cranmer, who has been so absurdly styled the "first Protestant Archbishop of Canterbury."

(To be continued.)

MY YOUNG ALCIDES.*

MISS YONGE introduces her *Young Alcides* to the reader in a tone of deprecation and apology. "Ideas have a tyrannous power of insisting on being worked out." She could not help herself

* *My Young Alcides.* By Charlotte M. Yonge. London: Macmillan. 1876.

in this case. We have no doubt that this describes truly the command which fancy, habitually obeyed, obtains over the pen of fluent writers of fiction—of those who sincerely love their work, who find it easy, and also find readers. All suggestions of the fancy or imagination bring a sense of inspiration with them. An idea must be worked out. The working out follows inevitably upon the conception. It is in vain that the critic interposes and enjoins waiting, refreshing the worn fancy by rest and suspension of labour. Such rest is not, it would seem, compatible with the faculty of story-telling. In vulgar terms, a novel-writer must have a novel always upon the stocks. But if the pen is thus the slave of fancy, fancy in its turn may become the slave of habit. Use makes that easy which was once an effort of the whole mind. More labour of thinking, we may observe, as well as keener flush of fancy, goes to the early productions of an imaginative writer. Later on the work may almost be said to do itself. The pen knows the road to its end.

We are bound to admit, then, the necessity which domineers over the novelist—that is, the successful novelist confident of readers. Probably many a tale is elaborated simply because it stops the way, and it is less trouble to follow it out than to turn it aside. But in the present case we cannot be sure what the ideas were which must be worked out. A mind so busy and ingenious as Miss Yonge's could not see a new vein struck out without sympathy, and that sympathy must needs take an active form. Miss Thackeray's fairy tales modernized were too successful an experiment not to stimulate a generous emulation. But the author of the *Heir of Redclyffe* has a mind romantic indeed, but essentially didactic. She instructs by pleasing. She would neither condescend blindly to imitate, nor would modern Cinderellas and Sleeping Beauties excite her invention. Such pretty inutilities, as she must think them, wake no response. In one case Miss Thackeray has set an example of turning this vein to didactic purposes. Jack the Giant Killer is modernized into a working curate, not, we consider, with the charm which hangs round the sister triflers. The truth is, Fancifulness, which may be regarded as the diminutive of Fancy, finds a useful purpose a heavy weight for airy wings. They flag under the burden. She can insinuate a moral of the commonplace order—Don't be vain because you are pretty; don't be envious; don't tell stories: be cheerful and make yourself pleasant whatever happens. But it is out of her way to say, Be laborious, be a teetotaller, keep regular accounts, clear drains, build churches. She entertains us in the recreation hour, and does not aim to amuse us with our work—the business of our lives.

Miss Yonge, in fearing that her idea may be leading her in a track already worthily pre-occupied, almost tells us that the thought of modernizing an ancient fable was put into her head. But, once there, it must follow her bent, and necessarily she sought for an instructive fable. The Labours of Hercules certainly fell in very well with this requirement, for his labours were undoubtedly useful, and some of them applicable to the needs of all time; else certain familiar illustrations have for some ages been misapplied. But, reduced from the magnificent vagueness of legend to line and rule, they inevitably lose their poetry, and with it their dignity. As the Augean Stables could not be cleaned out by the means with which we are familiar, we suppose some grand way of managing matters; but there is no mystery in carting off a farmer's dunghill, however indefatigable and up to his work he may show himself, and we feel our hero a little lowered in the process. He is distinctly described as without the sense of humour; but surely giants have humour, and we may at least indulge the fancy that Hercules found and made some fun out of his unsavoury task. It results, therefore, from the choice of subject, that the fancy expatiates more on minor points than on the larger task of making legend or fairyland and prosaic life meet half-way, giving to every-day existence a fairy glamour, and a touch of humanity, with its griefs and joys, to the illusive world of imagination. Considerable ingenuity is shown and evidently great amusement found in Englishing Greek names and places, and in discovering a certain punning rather than literal parallel for some of the hero's labours. In this light the thing is a puzzle to be worked out, a game to be played with cleverness and spirit; but, the nomenclature once established and the fable well in hand, we are on familiar ground, and know where we are too plainly. The amusement in all such transpositions must lie in adapting impossible circumstances to modern possibilities, and surprising the reader into acquiescence; making a whimsical rich old lady perform the feats of a fairy godmother, changing a good-natured beast into a clumsy, ugly, not unlovable young fellow; but here there is no meeting on neutral ground. We are amongst Miss Yonge's *dramatis personæ*, who, though their acts may be a little out of the common way, yet in their way of doing them and in their talk about them are faulty, or prejudiced, or foolish, or unbelieving, or religious, or keenly conscientious, or self-disparaging in the precise tone of her most realistic narratives. This is, of course, largely due to the fact of the machinery being impracticable for her natural method. Hercules is no doubt a very difficult personage to handle; and she undertakes to draw a character where, as a question of art, character-drawing should no more be attempted than in the *Arabian Nights*. There is no presumption, however, in the working out of the attempt. The author makes her hero taciturn and apt to break off in the middle or beginning of his sentences where the might of feeling is at work. "If I could only——" "If only," and there he stops, leaving all the depths to be inferred from the breaks and pauses so familiar to female pens a little afraid of getting beyond their depth if they finish their sentence. Once, however, when urged to an explanation, he despatches the question of his passion in summary terms. He had "just taken out his heart and crushed it." But who could set Hercules talking so as to satisfy our vague ideas? It is so much easier to guess what he would not say than what he would. One touch we quite agree with, and give the author credit for it. He is very apt to fall asleep when read to. That Hercules was a lady's man everybody knows, and in fact he could flirt. But this weakness does not fall in with the present conception, though Harold is absolutely under the influence of the narrator (his aunt in relationship though his junior in age), and the devoted lover of the Lady who represents the mythological wonder—the stag, or fawn, with golden horns.

The father and uncle of our hero Harold were sons of an English country gentleman who, falling under the influence of a turbulent Pole, Prometesky (Prometheus), during the excitement connected with the Reform Bill, turned democrats, married the daughters of a Radical farmer, stimulated the peasantry to riot and rebellion, and got transported for life along with Prometesky; who finds his Rock in Australia. The brothers whom he has misled die there, leaving the one a son (Harold or Hercules), the other a son and daughter—Eustace (that is, Eurystheus) and the child Dora, who we see from the first is in training for Dejanira. It is at the antipodes that Harold strangles the serpent, and grows up to man's estate, untaught, reckless, committing all the improprieties which unfit his prototype for an example; then in a fit of jealous fury he carries off his wife Meg Cree (Megara), and driving madly in the darkness upsets her and his two children down a precipice, and becomes a prey to despondency. At the news of the death of their grandfather the young people come to England, Eustace to succeed to his grandfather's estate; and the introduction to their youthful aunt takes place. Harold, of course, is of magnificent and gigantic proportions; at once he wins the aunt's regard and admiration, and the party agree to keep house together at the family mansion, Arghouse (Argos), near the town of Micening (Mycenæ), and here the Labours are carried out, of which the modern Eurystheus, an empty, vainglorious, tuft-hunting snob, takes the credit. Harold, in simplicity of heart, sets about reforming all abuses, regardless who has the praise. The first feat is a literal reproduction. There is a wild-beast show on Neme Heath (Nemæa); the lion escapes, to the terror of the multitude, and is mastered, and choked by Harold, with the aid of a carriage-rug; his skin figuring ever after in the narrative. The Lernean Hydra is typically represented by the "Dragon's Head" public, which, when put down and shut up on one side of the street, develops into several dragons—"Real," "Original" "Dragons' Heads"—on the other, until the Curate, Ben Yolland, whom we take to be Iolas, strikes at the root of the evil. The Club we assume to be verbally represented in the Workman's Club, established on temperance principles, at a pottery, set up as a Limited Liability Company. The swift Stag of the Golden Horns, who is to be caught alive, is Viola, of fawn-like grace, beauty, and pretty wilfulness, whom Harold, meeting on her pony, leads a willing captive to Aunt Lucy, from whom, by the will of wrathful Diana, her lady mother, she has been estranged. The capture of the Wild Boar in the snow is the rescue from a snowed-up train of the Earl of Erymanth (Erymanthus), a prosy nobleman, pronounced by his deliverer "a great bore." The Augean Stables are the miasma-breeding premises of a farmer who guides himself by the proverb that Muck is the farmer's nosegay.

The carnivorous birds of Lake Stymphalis are the scandal-mongers Avice Stympson and her sisters, whom the hero conquers by rescuing their dog from a mill-race. The prodigious wild bull which laid waste the country is Bullock, the bullying agent of the Arghouse property. The Mares of Diomed, which fed on human flesh, are the racers of Dermot, an Irish absentee, who for their sakes leaves his tenantry to starve. The girdle of the Amazons is the Champion Belt of the Archery Club, long held by the Amazon Hippolita Horsman, whose family (the Centaurs) have their further work to do in the story. The tenth labour is performed in Australia, where Harold encounters the sheep-stealer (Geryon) and wrestles with the giant, his double, and bearing his name, who seems to personate in the author's mind the Hercules of vulgar heathendom, whom she is anxious to dissociate from the hero who chose Virtue instead of Pleasure. The golden apples come from the same region. They are nuggets of gold committed under difficulties to his keeping in atonement for a fraud. The crowning labour, in which Cerberus figures, must be a hard nut for any invention to crack. He has to be reduced to one dog—Kerby; but then he is a mad one.

To produce a vigorous picture of a "great simple nature," intent on reforming the more patent and flagrant social miseries, has been the author's aim throughout, rather than any reproduction of the charm of classic legend. We have read lately that drains do not lend themselves readily to the comic muse, and social reforms of the material order are equally coy of putting themselves to school with the Graces. Yet sometimes Miss Yonge shows a gratuitous defiance of elegance in her determination to be real. The diminutives and *sobriquets* by which she dishes rishes her characters needlessly jar on our taste, though we recognise in them the hold she keeps on her idea. But the reader, too, has his work to do as well as the author. It is impossible to read the story without treating it as a puzzle to be found out, and, if no solution presents itself, a sense of incongruity remains. We do not, it is true, know a great deal about Eurystheus, but his representative in the modern version is irreconcilable with our notions. We

suppose that, as Shakespeare, wanting a Roman buffoon, went to the senate house, so here, wanting a snob as a foil for her simple noble-hearted hero, she made sure that legend, if only full enough, could furnish her with one; but his Government-house ball, his study of the Peerage, his appeals to Harold on the point of kid-gloves and gentility, seem to the reader to break too entirely loose from the analogy which the author undertakes to work out. This, however, may be hypercritical.

The work is a bold venture, and, if not wholly successful, is at least a proof of the author's powers. It is carried through with a spirit and evident enjoyment which excites the reader's sympathy when he perceives that what he at first looked for is not within the writer's scope or plan. But in one point the legend, both in itself and as she treats it, does fall in with a natural bent. We suppose that undisciplined strength—the gigantic mould of mind and body—must always be attractive to the physically weaker sex. Whether in imagination or reality it is a fascinating idea to subdue so much force to gentleness and practical good. And we observe here a greater tolerance for manly weaknesses than in the author's earlier works, and a greater trust in woman's beneficent influence. The youthful Aunt Lucy (placed in that relation as the only one which permitted her unchaperoned companionship) marries in the end the reformed spendthrift—a pickle in childhood, and sent home by many successive tutors as impracticable. Dejanira, after having done her work upon the hero by means of smallpox infection, marries the converted sceptic; and Harold himself, by the unanimous voice of all the survivors of the story, owes the subduing of his wild nature to Lucy's tender watchfulness and good counsels, who shows herself throughout her narrative his unconscious good genius.

CHINESE PROVERBS.*

THE East is the home of proverbs. If we seek for the causes which have produced this result, we find prominent among them the prevailing custom in Asia of imparting both instruction and amusement by word of mouth, and also the genius of most Oriental languages, which, from their conciseness, lend themselves easily and gracefully to the form of words known as proverbs. There is nothing more calculated to revive the flagging attention of an audience, or to add flavour to a discourse, than the judicious use of short, apt, and pithy sayings. Of this none are better aware than the wandering Arab story-teller whose bread depends on the interest he is able to excite among the wealthy frequenters of Eastern bazaars, or the Indian vagrant who, seated beneath some shady tree, seeks to enchain the attention of his village audience by tales of love and adventure; or, again, the Japanese priest, who makes pithy sayings and broad jokes his vehicle of instruction, and emphasizes his lessons in morality by homely and not always delicate illustrations. In China, however, the early introduction of cheap printing and the comparatively wide spread of education has in great measure substituted the story-book for the story-teller, and volumes of discourses for extempore sermons. From one fruitful provocative to proverb-making the Chinese are therefore cut off; but, on the other hand, their language, from its conciseness and its ideographic character, is pre-eminently fitted to express in terse and pictorial figures those results of observation and experience which are apt to form themselves into proverbs; and at the same time the literary habits of the people are just such as to encourage a taste for moulding these into polished and well-turned phrases. The result is that in no country in the world have proverbs a wider circulation than in China, and as a natural consequence they reflect with both truth and accuracy the national characteristics of the people.

Several European writers have preceded Mr. Scarborough in collecting Chinese proverbs. More than fifty years ago, Sir John Davis published his *Chinese Moral Maxims;* in 1869 M. Perny brought out a small volume of *Proverbes Chinois;* and Mr. Doolittle, in the second part of his *Handbook of the Chinese Language*, has given a long list of proverbial sayings. But these collections sink into insignificance in point of number when compared with that in the volume before us. Sir John Davis's book contained 200 proverbs, M. Perny's 441, Mr. Doolittle's several hundred, but Mr. Scarborough has furnished us with 2,720 examples. The native collections are neither numerous nor large. Mr. Scarborough enumerates eight works upon which he has drawn, but as he justly observes, "the bulk of the proverbs current in the land exist only in the memories and on the lips of the population," and it is from these sources that the present collection has principally been gathered.

As with the sayings of every land, Chinese proverbs assume various forms. The most esteemed are those known as *Tuy-tsze*, or "antithetical couplets." These are formed according to strictly technical rules. They must contain the same number of characters in each line, which must scan accurately as regards the tones or inflexions of the voice which are inherent in them, and in the verbal construction of the couplet there must be an antithesis between the parts of speech represented by the words composing each line; thus particles must be placed in antithesis to particles, nouns to nouns, verbs to verbs, and so on. Another kind are the *Leen-keu*, or "connected sentences." These are less formal than the *Tuy-tsé*, the only rule to be observed in their composition being that each line must contain the same number of characters, and there is generally, though not of necessity, a sharp antithesis between the first and second lines. As a specimen of this antithesis we may quote the translation of proverb No. 1674 in the work before us, "It is not hard to talk about good works, but to do them." Others take the form of a plain sentence, to which sometimes is given just enough rhythm to give it an easy and flowing utterance. So much for the styles in which they are composed in the original; but, before leaving this part of the subject, we will turn for a moment to the way in which Mr. Scarborough has rendered them into English. Their sense he has succeeded in imparting with great accuracy, and where he has been content to give us prose versions of their meaning, he has done so in terse English; but unfortunately he has in some instances attempted to reproduce the original in verse, and in a vast majority of these cases it would have been much better if he had refused to listen to the promptings of his poetic fancy. For example, it would not be difficult to imagine a prose version of proverb No. 1172 which would be preferable to the following:—

> Civil and martial mandarins must
> One to his seal, one to his flag, trust;

or one of No. 1169 to this:—

> One dash of a civil magistrate's pen
> Makes the martial magistrate jump again;

or one of No. 1133 to this:—

> Try you to defraud in customs and revenue;
> The mandarin soon will try to be having you.

But in saying this, we have pointed out the only fault we have to find with the book. The proverbs are well selected and arranged, and a copious index enables the reader to refer at once to such proverbs as bear on any particular subject or subjects.

One characteristic of the Chinese, as of all Oriental peoples, presents itself prominently in the proverbs before us, and that is the wide difference which exists between the high standard of morality in matters of government and conduct which they profess to strive to reach, and the corruption and dishonesty which pervade their practice in every condition of life; in other words, between their professions and their deeds. Nothing can be more sublime than the motives which it is said should actuate the conduct of man to his fellow-men, and yet often in the same page we meet with proverbs which throw an unerring light on the real springs of action which are uppermost in the minds of the people. What saying, for example, could be more suggestive of high-souled and pure-handed officials than the following:—"There are three rules for men in office: be upright, be cautious, be diligent." And yet how different is the picture, which evidently is the truest to nature, afforded by such as those which appear cheek-by-jowl with the above:—"Neither dogs nor mandarins injure those who give them anything," "Men's hearts are like iron, and the rule of mandarins like a furnace," "An officer's door is like a market-place," "Deceive, but don't insult, a mandarin." But this violent contrast meets one at every turn in China. The Emperors, many of whom have been as dissolute, selfish, and cruel as it is possible for men to be, have been accustomed to expatiate in the *Peking Gazette* on the ardent zeal with which they have attempted to follow the virtuous, patriotic, and merciful conduct of some idealized being of antiquity; no Minister of State, however itching may be his palm, writes of himself in any public document but as of one who passes sleepless nights and restless days in his endeavours to suppress all corruption in the administration of his department; and whole libraries of books are written on the virtues of honest and patriotic mandarins, who, if they ever existed, find but very few in modern China to follow in their train. Of course we do not mean to say that there are no honest and upright officials in China, but such are in an infinitesimal minority. But it should always be borne in mind, in palliation of the almost universal corruption, that their salaries are ludicrously small, often quite insufficient to pay the followers and servants necessary to the maintenance of their posts, and that they hold their appointments for three years only. The results of these causes are that each one is by force of circumstances compelled to prey upon the inhabitants of the districts under his control, and by a selfish instinct is tempted to squeeze as much out of the people during the tenure of his office as they will submit to part with without breaking out into open revolt. In this way it has come to pass that at the present day official virtue is but a relative term in China, and people speak with admiration and respect of a mandarin who supplements his income out of his subjects' pockets without oppressing them, and who tempers bribery with a show of justice. "Never believe a portionless magistrate when he says his rule is pure" is a saying which is plainly the result of popular experience.

The view suggested by a number of proverbs in the volume before us of the religious tendencies of the people is very interesting, and shows how infinitely deeper seated among them is the natural worship of heaven or the Supreme Being than are the imported sophistries and superstitions of Buddha and Laou-tsze. Heaven is never otherwise than respectfully referred to, while nothing can be more contemptuous than the way in which Buddhist and Taonist priests are often spoken of. We may quote the following proverbs as illustrative of these remarks:—"Man depends on heaven, as a ship on her pilot"; "Heaven responds to man as quickly as shadow to form, or echo to voice"; "There is nothing partial in the ways of heaven"; "Imperial heaven will never slight a man of sorrows." On the other hand, "Only

* *A Collection of Chinese Proverbs.* Translated and Arranged by William Scarborough. London: Trübner & Co. 1875.

those become bonzes who can't make a living"; "The monastery faces the nunnery; there is nothing in that—yet there may be"; "For one son who becomes a priest nine generations get to heaven"; "A magistrate is never at leisure—a bonze always is," &c.

The popular views on the various relations of life are abundantly illustrated by numerous proverbs in Mr. Scarborough's collection. The necessity of showing filial piety to parents, the value set by parents upon sons, and the indifference shown as to the possession of daughters, are all plainly traced out; and though there is no direct reference to infanticide, there is an unpleasant sound in such sayings as, "When one family *rears* a daughter, a hundred families ask her in marriage"; "Those who *rear* daughters hope for great suitors." Judging from some of the proverbs relating to the marriage state, Chinese opinion seems to agree with the old English saying:—

> A spaniel, a wife, and a walnut-tree,
> The more they are beaten the better they be;

but there is abundant evidence that domestic happiness is common, and also that not unfrequently "the grey mare is the best horse" in China as elsewhere. Between many of the less obvious of these Chinese proverbs and those current among ourselves there is a striking resemblance; for instance, a half-witted person is described in our midland counties as being "ninepence in the shilling," and in China as being "the fourth of a thousand cash," or "two hundred and fifty." Throughout most of Mr. Scarborough's pages a very great deal of practical wisdom is to be found; and, in these days of superficial acquirements, many students might derive benefit from such saws on study as the following:—"Learning cannot be gulped down," "Every character must be chewed to get out its juice," "Good students are like workers in hard wood," "Most things are easy to learn, but hard to master."

It may be doubted whether some of the sayings quoted by Mr. Scarborough can rightly be described as proverbs; such, for example, as to wish "May fair winds attend you!" But, with few exceptions, his collection represents very perfectly the proverbial wisdom of China, and to all who are interested in such subjects we confidently recommend his volume.

YACHTING IN THE ARCTIC SEAS.*

MR. LAMONT'S book is interesting, although in some sense it is a record of failures. He has a passion for Arctic voyages. A good many years ago he published an entertaining volume on *Seasons with the Sea-Horses;* and, after an interval devoted to public life and foreign travel, he has returned to his early love with as much ardour as ever. Sitting in solitary meditation on the bleak shores of Spitzbergen, among the icebergs, walruses, seals, and seafowl, he falls into a train of melancholy regrets over wasted years of his life, and money squandered on electioneering. Looking at things from his personal point of view, we cannot doubt that he is right. For he has most of the qualifications, natural and adventitious, for a successful Arctic explorer. He has time and money at his disposal; he has set his heart on contributing to Arctic discovery; and, as he delights in this sort of life in spite of its hardships, its dangers, and its occasional dreariness, he is content to resign himself to disappointments when he has done his utmost to command success. His days of involuntary waiting pass the more easily that he is an enthusiastic sportsman and a deadly shot. Most men would be disposed to doubt whether hunting the walrus is the most exciting sport in the world. But that is Mr. Lamont's opinion, and he has some right to speak, for he has followed the chase in the interior of Africa and Asia, not to speak of the highlands of his native Scotland. He and his people had their fair share of dangers in the voyage he is describing. Twice his steam yacht took the ground or the ice, in treacherous currents laden with icebergs and drifting fragments. In case of the worst, which seemed extremely likely to happen to them, they had to betake themselves to the boats with valuables and necessaries, and awaited in intense anxiety a result which they could do little to influence. Had their ship been lost, there would have been nothing left them but a winter passed in those inhospitable latitudes, or a row across the ocean to Norway in their open boats. Twice they were saved when they scarcely expected it, and returned to their comfortable vessel to find it little the worse. Accidents of the kind, as Mr. Micawber remarks, may be confidently expected, and, on the whole, the crew of the *Diana* had cause to congratulate themselves on their good fortune. But what most people would perhaps regard as the most serious drawback to such adventurous cruises are those summer gales of Novaya Zembla which, when they come thick with drifting snow, "are productive of the most abject state of despair." The eddying sleet drives every one below except the watch and the man at the wheel, who sits like a snow statue with his feet in a bag of hay. The look-out has a tremendous responsibility, as they go groping about the edge of the ice-pack or of some rock-bound coast with its jutting precipices. Their knowledge of the currents which may be carrying them along is mere guesswork, and they are always in expectation of a disagreeable surprise when the atmosphere thins and shows them their whereabouts. Everything on the deck is enveloped in ice, and each time the vessel goes about in a succession of cautious tacks, the silence is broken by the rattle of showers of icicles. "The angle at which the ship heels over to leeward renders ordinary occupations impossible; and rather than encounter the hazard of tumbling and rolling against each other in the narrow cabin, we sit in well-jammed positions and spend the time in desultory reading."

Mr. Lamont, however, is a living proof that a life of this kind has a charm for certain temperaments, and in the general election of 1868 he withdrew, as he tells us, from a contest for his county, that he might undertake another cruise to the North. He superintended the building of a screw steam yacht to suit his fancy, and the *Diana* of 251 tons was the result. Strong, rakish, and handy, she proved all that could be desired, though, when the screw was broken at a critical moment, it turned out that the blades had been made of soft iron instead of cast steel as per contract. In getting his crew together, Mr. Lamont had an eye to the double purpose with which he was sailing. It was his intention to force his way northward and eastward as far as he could, towards the mysterious territories of Gilles Land and Franz Joseph Land, or into those little-known seas which lie to the east of Novaya Zembla. But as success in these objects depended on the season, and as disappointments and delays were certain in any case, he made his arrangements to fall back on walrus-hunting and seal-shooting. It is an idea of his, and it seems a very rational one, that amateur enterprise would be greatly promoted were gentlemen to combine profit with discovery. By making use of one's idle time, one may not only get a great deal of exciting amusement, but fill the ship with a cargo that may actually cover its expenses. An average seal will yield 200 lbs. of blubber, a good-sized walrus about 500 lbs., and the latter animal, including the hide and the ivory, will give a value of about 12*l.* So the hold of the *Diana* was fitted with tanks for the reception of blubber, and as her stock of coals was consumed their place was to be filled up with cargo. Moreover, in addition to the experienced harpooners and others whom he shipped before sailing from Scotland, Mr. Lamont had bespoken the services of half a dozen Norsemen supposed to be specially at home in chasing these Arctic animals. It seems certain, from what he tells us, that making commercial adventure one of the objects of Arctic voyaging would rather stimulate adventurous research than retard it. For it is only by going a long way off and taking advantage of the superiority given by steam power that you can hope nowadays to make good bags of seals and walruses. The creeks and inlets in the more accessible waters swarm with sloops from the various Norwegian ports which are fitted out for hunting and nothing else. Their hardy mariners push on emulously among the dangerous ice floes that threaten to beset them and cut off their retreat; and their vessels, by the way, are as little fitted as may be for ice navigation, being generally old and most indifferently found. But the result is that game of all sorts, amphibious and terrestrial, grows annually scarcer. The walruses have either shifted their haunts altogether, or become extraordinarily shy and suspicious; while valleys in Spitzbergen that used to be pastured with great herds of reindeer may be drawn blank day after day by the most skilful and indefatigable stalker. So far, however, as the reindeer are concerned, much appears to depend on the season. Towards the end of the summer, and before starting on the homeward voyage, Mr. Lamont's hunts might almost be characterized as butchery were it not that he was in want of fresh provisions for his crew. On one occasion, almost incredible as it sounds, he bagged seven out of ten deer on a single drive and with a small muzzle-loading rifle. Another time, when we hear of seventeen being killed on the same stretch of ground, we are not surprised to learn that the poor animals were so tame that "we might have shot any number by simply standing in view till they came up to be shot." Nothing but frying and feasting was going forward on board; the yacht's rigging was festooned with haunches and fat forequarters; and, after ample provision had been made for the homeward voyage, several casks full of hams were salted down. By way of contrast to this tame slaughter of reindeer for the pot or spit, we have some thrilling incidents of the walrus-hunting which is Mr. Lamont's ideal of enjoyment. The animal may be either shot or harpooned. To shoot him he should be approached from behind, as the vulnerable spots are in the brain, and the brain is in the back of the unshapely head. There is a certain excitement in the stalk over the water, for when the walruses lie out in groups they always place a sentinel. The boat must steal upon them through the channels among the floes, and, according to Mr. Lamont, should its bows jar on the edge of the ice the vibrations may give the alarm to the game to a distance of a couple of miles or so. But in shooting, with the discharge of the shot all is over; either the animal is killed where he lies, or he rolls himself over the edge of the ice and disappears in the depths of the water. When he is harpooned, on the contrary, everybody must be on the alert; much more so should a couple of great bulls be harpooned at the same time, as not unfrequently happens. They go under with a rush, dragging the stem of the boat down after them; and should the man charged with the duty delay to cut clear at the critical moment, the wrecked crew may be floating in the icy water before they have had time to speculate on the probabilities of an accident; or the wounded monster may turn short on the line like a salmon, and, rising savagely below the boat, drive his tusks through the bottom. In a well-found boat every precaution is taken against such casualties. Nails and a hammer and

* *Yachting in the Arctic Seas; or, Notes of Five Voyages of Sport and Discovery in the Neighbourhood of Spitzbergen and Novaya Zembla.* By James Lamont, F.G.S., F.R.G.S. London: Chatto & Windus. 1876.

plates of metal sheathing are stowed away handy; and indeed all the hunting appointments are made as perfect as possible. Still fatal accidents are frequent. Many a boat that pulls away cheerily from the ship is never heard of again; and on one occasion the *Diana* picked up a stranded walrus boat, with broken lines, that had evidently been dragged under to the drowning of the crew.

We need not say much of Mr. Lamont's volume as a record of discovery, for the simple reason that, through no fault of his own, he discovered very little. His perseverance and enterprise deserved a better recompense; but luck is everything in Arctic navigation, and in the season of 1869 in particular the ice seems to have been set thick to the southward. Repeatedly he steamed up for those narrow waters which lead to the east of Novaya Zemblia, to the Kara Sea, or to the icy waters that lie towards Gilles Land on the north coast of Spitzbergen. Sometimes he was stopped on the threshold; sometimes he could thread their dangerous mazes up to a certain point, but had to return in the end without having achieved any tangible results. Nothing, we should imagine, can be more mortifying than the consciousness that the settled lie of the ice-pack, after an unusually inclement season, makes fresh exploration absolutely hopeless; and it would appear that the climate must have changed greatly in the last two or three centuries, or else that the earliest Arctic navigators, who sailed northwards in comparative cockle-shells, had the luck which their extraordinary daring deserved. Year after year you may be locked out by leagues of impenetrable ice-fields from land that was laid down on the charts one hundred and fifty or two hundred years ago. In taking leave of Mr. Lamont we may add that he has turned the achievements of predecessors and contemporaries to good literary purpose, and that his book is interspersed with much useful geographical information, which makes it a valuable record of discovery from the earliest period to the present time.

AMERICAN LITERATURE.

"A FARMER'S Vacation"* seems to have been spent as wisely, profitably, and pleasantly as vacations used to be spent by University men in the days when reading was a reality without being an intolerable burden, and unfashionable places were often selected as being precisely those where men might read without fear of disturbance all the morning, and find enjoyable walks and rides for the afternoon; as some very few men still spend a holiday when they neither intend to write a book nor to get up material for small talk during the coming season. The Channel Islands have been quite as much visited and described as they deserve; but that does not render them less interesting to a man who likes to see with his own eyes and choose for himself, not what he "ought to have seen," but what he really cares to see. Holland is a land of dull weather and wearisome sameness of scenery; but scenery is not the only thing worth seeing or travelling to see, and Holland has sights of its own to show that are quite as interesting in their way as the highest mountain that was ever climbed or the most remarkable of historical relics and ruins. Mr. Waring's professional interest in the peculiar agricultural system of the Channel Islands, and in the natural wealth and splendid cultivation of the lands which Holland and her sister provinces have reclaimed from the ocean, gave a special purpose to his journey, and lends a continuity and unity to his narrative which the travels and writings of holiday tourists rarely possess. A farmer fortunately can write as he can talk about his trade, without that fear of puzzling or wearying his audience which would hamper the merchant or manufacturer. The technical terms of his art are intelligible to all, and nearly all feel a respect for the oldest and most universal, and an interest in the simplest and least sophisticated, of human industries, which they entertain for no other. Consequently Mr. Waring's descriptions of the rich polders of the Netherlands, of the farm-buildings and houses whose size and comfort bear witness to the solid wealth of their owners, of the carefully kept dairies and the cheese factories, will be acceptable to a large circle of readers who have themselves little or nothing to do with farming, and know just enough of it to distinguish a shorthorn from an Alderney or a clover-field from pasture-land. But the most valuable and interesting part of his work is that which explains, with extreme care and clearness, and with the help of a few simple diagrams, maps, and illustrations, the process by which great areas of land—some of it the bed of lakes or inlets from time immemorial, some of it drowned by inundations of which history still preserves the record—have been reclaimed for habitation and cultivation; and of the methods by which the same or similar objects were achieved in olden days. The vast dykes that still protect great part of the Netherlands from the tides of the North Sea or the floods of the Rhine, and the soil they guard, lying many yards below high-water mark, remind the observer how very ancient is the system of reclamation which, in its latest feats, seems one of the marvellous tasks that have taxed to the uttermost the gigantic mechanical resources of the age; how nearly the windmill achieved all that steam-engines can do; how early the Dutch ventured upon what appears the most daring of human inventions, the creation of a land from the ocean bottom, not by raising the soil, but simply by excluding the water; and how completely they relied on their artificial coasts when they ventured to build villages, to scatter a large population, and even to found cities, at such a level that a single breach in the sea-wall might expose them all to be permanently covered. The saying that the country of the Netherlands "draws fifty feet of water" does not, of course, express a literal truth. Great part of it is above high-water mark, or no one would ever have settled there; great part of the rest was rather marsh and swamp than lake—that is, lay between high and low water mark—or its reclamation would hardly have entered into the minds of men. But there is a large area which lies so far below the sea-level that the canal-boats sail at a considerable elevation over the surrounding land, while the ships into which their loads are delivered have their keels on a level with the mast or cabin chimney-top of the canal-boats. Ships and farmhouses are not near enough for their respective heights to be compared; but if they were, it is strictly true that the roofs of the houses would be seen to be lower than the vessels' keels, and that the fishes swim above the topmost branches of the trees. As it is, the double series of canals by which the water is drained from the reclaimed lands, and the gradual ascent by which it is delivered into the distant ocean, present a much slighter contrast, and preclude the possibility of actually realizing by the eye the difference of the extreme levels—the polder in which the cattle feed, and the sea, forty feet higher, on which the vessels float that convey the dairy produce to England or America. These polders are the richest and most valuable soil in the Netherlands, and, great as is the cost of reclamation, the available land recovered sells at once at a rate which nearly covers the actual expense of the costliest work yet achieved, leaving the State which alone can undertake such enormous works—the clear gainer by the entire taxation which the land and the population it will support can bear. We should recommend to any one who has not time or desire to read through Mr. Waring's modest volume to study at least his lucid account of the draining of the Haarlem Lake, so as to understand the courage, skill, and perseverance which such works even now require, and to form some faint idea of the pains and determination by which the country was enlarged and preserved in the days when steam-power was yet unknown. Mr. Waring carefully explains the peculiar embarrassments arising from the intermittent working of the windmills, and the enormous addition to the necessary "basin" space—the canals built up for the reception of the drainage water—which that working required.

*A Summer in Norway** is a well-written, pleasant, but by no means striking description of scenery and people that have been described a hundred times before. Any one who has never seen the midnight sun, and has no idea what it is really like, may get a clear notion of the phenomenon from this volume. Any one who has never enjoyed Norwegian salmon-fishing, or heard other people talk about it, and the charms of the country to which it introduces them, will here find the best available substitute for direct knowledge of the subject. Any one who has never sat in a carriole or read of carriole-travelling will learn what a carriole is, and what are its pleasures and inconveniences; and any one who knows nothing about the hardy yeomanry of Norway, the stock from which have sprung so many nobilities, will get some slight notion of a people well worth understanding from these pages. But we fear that when this is said, there is not much more to say for a very readable book, and that the class to whose consideration we have commended it—educated English men and women who have neither visited Norway nor heard and read as much as they care to know about it—is not numerous enough to give it a remunerative circulation in England. Its prospects at home may be better. America is so far off that men cannot take a month's fishing in Norway by way of a yearly holiday; and the regular American travellers seldom venture into regions devoid of all the comforts of hotels, and by no means attractive to ladies; so that the author may hope to find plenty of his countrymen who neither know all that he can tell them nor are quite indifferent to it.

A Glimpse at the Art of Japan† is not a book to be skimmed, and the treatment is a little too deep and technical to attract the ordinary reader, or win from him that attentive study which is necessary to understand it. But to artists, to all concerned in designing and in art manufactures, to intelligent collectors and connoisseurs, it should be welcome, as affording a careful and well-considered view of the principles and character of Oriental art, and of its signal divergence from all that is called by the same name in Europe; of the mode in which, by foregoing the attempt to represent nature accurately, and subordinating literal truth to practical availability, the artists of Japan and China have succeeded in a class of designs and a kind of ornamentation hardly studied here, and of the exquisite taste in colour which has given so peculiar a value to their ware. The deficiency of the book is its poverty in illustrations. These are few, and those which are given are mere faint outlines of figures,

* *A Farmer's Vacation.* By George E. Waring, junior, of Ogden Farm. Reprinted, with Additions, from "Scribner's Monthly." Illustrated. Boston: Osgood & Co. London: Sampson Low & Co. 1876.

* *A Summer in Norway; with Notes on the Industries, Habits, Customs, and Peculiarities of the People, the History and Institutions of the Country its Climate, Topography, and Productions.* Also, an Account of the Red-Deer, Reindeer, and Elk. By John Dean Caton, LL.D., ex-Chief Justice of the Supreme Court of the State of Illinois. Chicago: Jansen & Co. London: Trübner & Co. 1875.

† *A Glimpse at the Art of Japan.* By James Jackson Jarves, Author of "Art Studies," "Art Idea," &c. &c. New York: Hurd & Houghton. Cambridge: The Riverside Press. London: Sampson Low & Co. 1876.

presenting to the unprofessional reader no idea whatever, save that of imperfection, incompleteness, and illegibility. They have, of course, their use and meaning as explanatory of Japanese drawing, and its adaptation to curved surfaces; but to render the book fully serviceable to students much more should have been given. As it is, however, the volume is one which all interested in art wares, of whatever kind, should possess, and which they will be able to illustrate by comparing its descriptions and the principles it lays down with the numerous collections of Eastern art manufactures accessible to English students. It may give some little help, perhaps, to the development of a better and more eclectic school of design than we yet possess.

The record of a Quaker's experiences among the Indians * is not written with any party bias, and shows no disposition to criticize with severity the management of the Department, scandalous as most Americans believe it to be, nor yet to side with the Indians against the white men, to apologize for the cruelties of the savage, or exaggerate the treacherous crimes of a civilized soldiery. The author was a teacher under the patronage of the Government and on good terms with the Government agents, and therefore avoids any disclosures which might be offensive to his employers or injurious to his friends. Himself frequently exposed to danger, and living within sight of the most horrible scenes of the frightful border warfare that breaks out from time to time, he is under no temptation to palliate Indian atrocities; and, as a fervent votary of his own faith, he regards with especial horror the superstitious and idolatrous practices of the "savages," and the occasional captures of white women and children (generally Mexicans) by those whom he describes as heathens. Yet the general bearing of his testimony is favourable to the Indians, and most damaging to his countrymen. That the great majority even of such tribes as the Kiowas and Comanches wish to keep the peace even under severe provocation, and are seldom entangled in war except when made answerable for the action of young, impulsive, and unmanageable members of the tribe, or driven to madness by some of the treacherous surprises and atrocious massacres which the commanders of the American troops have repeatedly committed, and which the President has never punished—examples of which are incidentally given in the course of the Quaker's narrative—that they are not incapable of civilization were they put under tuitelage and protected from the white traders who make them mad with the vilest of intoxicating liquors, and encourage them to outrages by supplying them with rifles, revolvers, and ammunition—are the conclusions to which the author's intimate knowledge of a considerable portion of two of the least tameable tribes appears to have led him. To these conclusions the language and conduct of the elders and responsible chiefs, as related by nearly all trustworthy authorities—we do not count either borderers or soldiers among such—would seem distinctly to point. The Quakers have seldom failed to make and keep peace with the Indians if they are let alone. But the present system of tribute and robbery, exemption from law and liability to massacre, the practice of supplying the Indians with clothes and food (in payment of annuities promised when they were removed from their original homes), half of which are embezzled on the way, and the other half of such a quality as white paupers would reject with scorn, the encroachments of pioneers, the importation of whisky, the impunity of many leaders in the worst outrages, and the slaughter of any body of Indians—men, women, or children—that may come to hand, in retaliation for "Indian outrages," without any attempt to detect and hunt down the perpetrators—can only end in renewed "wars," and in the final extermination of the Red Man.

The story, not unduly prolonged, of *An American in Iceland*†, is open to the same remark that we have made on *A Summer in Norway*. Iceland, so far as English readers and English tourists are concerned, has been so thoroughly ransacked and explored, so frequently and fully described, that a new account of the country or the people, however well done, has the disadvantage of being obviously superfluous. The inherent interest of the island, its wild scenery, its strange history and literature, and the many relics of its ancient institutions which are still to be traced in its language and customs, are amply sufficient to ensure attention for one good book on the subject. But the field is necessarily limited, inasmuch as Iceland has but a small area, a monotonous character, and a very tame history; and, these once described, there is nothing more to say about it. If the many English and translated works on Icelandic subjects have not found their way to American readers, we do not doubt that their countryman's sketches, slight though they be, will excite some interest.

Of these Biographies of English Radical Leaders ‡ the principal, if not the sole, merit is that they are "brief." The men are ill selected, their history is badly told, their eulogies are ridiculously exaggerated, and the writer's notions of English politics and prospects are laughably absurd. He fancies that Sir Charles Dilke is one of the foremost men in Parliament, and not at all unlikely to have his choice, ere long, between the Premiership of a Monarchy and the Presidency of a Republic; that Mr. Peter Taylor is a popular idol; and that the principal leaders of opinion out of doors are Mr. Odger, Mr. Richards, Mr. Bradlaugh, and Professor Fawcett.

In undertaking *A Comparative History of Religions* * we certainly incline to think that Dr. Moffat has attempted a task far beyond his knowledge and his powers. In endeavouring to perform it within the limits of two small duodecimo volumes, he has assuredly condemned himself, not merely to complete, but to ludicrous, failure. Nor is the fault merely that of choosing an absurdly grand title for an insignificant work. The really historical information contained in the two "parts" now before us is very small, though they pretend to embrace a complete view of "sacred" books, from the date of Job, or the Zend-Avesta, to that of the Book of Mormon; and the light thrown on the actual relations of different "Scriptures" and creeds is even less valuable. On the whole, we can hardly understand why the book was written; and we cannot conceive why it should ever be read.

Two Lectures† on the relation of the Law to the Churches, by Mr. Justice Strong of the Supreme Court, are so very good that we only regret that they are not more complete and elaborate. For their own purpose—that of explaining to future ministers of religion that the Church as a human society, owning property, claiming rights, and capable of interfering with the rights of others, must be subject to the law of the land, and of explaining how far, in general, the laws of the States take cognizance of Church affairs, how far the Courts will interfere, and how far they consider themselves bound by the official action of the Church in its corporate character, or by its legitimately framed regulations—the Lectures are admirably framed. They go just so far as it was possible to go in laying down general principles, and pause just when any further inquiry would have led the author into the intricacies of technical detail and local differences of law. The result of the discourses may be summed up in this—that in the country where the idea of a "free Church in a free State" has been worked out most fully and consistently, a Church is a voluntary society, recognized by the State in that capacity alone, and dealt with in exactly the same way and on the same principles on which English law deals with an ordinary Club.

Mrs. or Miss Gail Hamilton undertakes to preach to the preachers a series of Sermons ‡ which certainly contain a good deal of sound and practical truth often overlooked by the clergy, and much oftener by laymen of an ecclesiastical or "evangelical" turn of mind. It is a little amusing to read in one place a sentence from which the "subjection of women" follows as a necessary and direct corollary; and it might be possible to find a few actual contradictions and palpable inconsistencies in this very volume. But in the main the doctrines inculcated in these sermons are sound, and, where they are unsound, they err precisely in the opposite direction to that in which ordinary preachers, lay or clerical, go astray. There is an aggressiveness in the title which but too truly reflects the tone of the book; and we cannot but think that, if it had been revised by a sensible man, sharing most of the writer's opinions but free from her feminine petulance and from that air of intellectual superiority which clever women are wont so absurdly to assume, the omission of passages amounting in all to some six pages would have doubled the circulation and quadrupled the influence of the work.

Our New Minister § is, we fancy, a first attempt in fiction; apparently a woman's. There is no power in it, and the ground is very ill chosen; constantly approaching topics so distinctly religious that they ought to be left wholly apart from the foolish flirtations which make up the substance of the story. It is possible that on another subject, and with the advantage of a plot, which is wanting to this tale, something better might be achieved. *Going West* ‖ is a good brisk boy's book; *Mice at Play* ¶ and the *Story-Book for the Children* ** are capital reading for winter evenings in a young family—the latter especially good. *Margery Keith* †† and *Faith and Patience* ‡‡ are of flimsy material, but not objectionable; and the "Young Defenders" §§ is a book which will delight boys between ten and fourteen.

* *The Life and Adventures of a Quaker among the Indians.* By Thomas C. Batley. Illustrated. Boston: Lee & Shepard. New York: Lee, Shepard, & Dillingham. London: Sampson Low & Co. 1875.

ADVERTISEMENTS.

MUSICAL UNION. H.R.H. the Duke of EDINBURGH, *President.*—The First of Eight MATINÉES, Tuesday, April 25. Pauer, Auer, Mme. Essipoff, Alfred Jaell, and Antoine Rubinstein are expected. The Record of 1875, with a list of 230 Artists engaged since 1844, dedicated to Vieuxtemps, is now published. Members having Nominations to send Names and Addresses to the Director. Subscription, Two Guineas, paid by cheque before Easter, to J. ELLA, 9 Victoria Square.

THE SOCIETY of PAINTERS in WATER COLOURS.—The FOURTEENTH WINTER EXHIBITION of SKETCHES and STUDIES is NOW OPEN, 5 Pall Mall East. Ten till Five. Admission [illegible]. D. FRIPP, *Secretary.*

DORÉ'S GREAT PICTURE of "CHRIST LEAVING the PRÆTORIUM," with "Dream of Pilate's Wife," "The Night of the Crucifixion," "La Vigne," "Soldiers of the Cross," "Christian Martyrs," "Gaming Table," &c.—DORÉ GALLERY, 35 New Bond Street. Ten to Six. Admission, 1s.

LIJAH WALTON.—WINTER EXHIBITION now OPEN.—A Large Collection of Water-Colour Drawings on VIEW, and for SALE. [illegible]igton Gallery, 191 Piccadilly. 7 to Dusk.—Admission, including Catalogue, 1s.

WENS COLLEGE, [illegible]er.—The PROFESSORSHIP of LOGIC, MENTAL and [illegible] PHILOSOPHY, and POLITICAL ECONOMY, will become VACANT in September [illegible] in consequence of the appointment of Professor [illegible]rvons to the Chair of Political Econo[illegible] in University College, London. Candidates are [illegible]vited to send applications and testi[illegible] to the Council, under cover to the Registrar, not [illegible]ater than Saturday, March 25, 1876. [illegible] as to the duties and emoluments of the office [illegible] may be learnt on application to J. G. Os[illegible]nwood, LL.D., Principal of the College.

J. HOLME NICHOLSON, *Registrar.*

SENATE, PULPIT, BAR.—ELOCUTION.—"Quod magis ad vos pertinet, et nescire malum est."—HOR.

Mr. GEORGE VANDENHOFF, 101 Gower Street (W.C.), Bedford Square (formerly leading Actor of the Haymarket Theatre, and honoured by large audiences as a Reader, Shakespearean Actor, and Lecturer throughout the United States), imparts valuable INSTRUCTIONS, ensuring an easy, natural, forcible, and unaffected style of delivery, with a system of VOCAL CULTURE effective for any arena.

Mr. VANDENHOFF'S Work on Elocution is a Text-Book in England and the United States, and Mr. V.'s Pupils have taken the highest prizes at the Intercollegiate Oratorical Contests in New York.—101 Gower Street, W.C.

STAMMERING, and all Defects of Speech, not organic, effectually Cured.

CHELTENHAM COLLEGE.—TWELVE SCHOLARSHIPS. Eight £40; Four £20. Election, Second Week in May. Apply to the SECRETARY, the College, Cheltenham.

RADLEY COLLEGE SCHOLARSHIPS.—An ELECTION to the SEWELL SCHOLARSHIP, value £55, and FOUR other ENTRANCE SCHOLARSHIPS, Two of £50 One of £30, and One of £20, will be held on Wednesday, May 10, 1876. They are all tenable for Four years.—Apply to the BURSAR, Radley College, Abingdon.

HIGHGATE SCHOOL.—ELECTION to FOUR SCHOLARSHIPS, £75, £50, £40, £40, in July.—Application to be made to the HEAD-MASTER, School House, Highgate, N.

MALVERN COLLEGE.

This COLLEGE contains THREE DEPARTMENTS—the CLASSICAL, MODERN, and PREPARATORY LOWER SCHOOL.

Boarding and Tuition, under Fourteen, £80; over Fourteen, £90. Non-Shareholders pay an extra fee of £6. Special advantages for Sons of Clergymen and Home Boarders.

For further information, apply to the Rev. ARTHUR FAGER, M.A., Head-Master, late Fellow and Tutor of New College, Oxford.

GERMANY.—High-class EDUCATION at the ROYAL COLLEGES, Cassel, attended by the Sons of the Crown Prince of Germany), with thorough German, French, and English Private Tuition by Resident Graduates, and a refined English home. Delightful neighbourhood of Wilhelmshöhe, the Aue, Park, and the Valley of the Fulda. Prospectus, with highest references. Terms, 70 to 90 Guineas, inclusive.—Address, Dr. SAUER, M.A., Cassel (who will be in England in April).

HURSLEY, WINCHESTER.—A. M. HEATHCOTE, B.A. Oxford, prepares BOYS, between Seven and Twelve for Public Schools. Terms, 100 and 120 Guineas. Holidays as at Winchester Coll., &c. After Easter he can receive Two or Three Boys.—Address, Home Close, Hursley, Winchester.

WOOLWICH, LINE, CONTROL, COOPER'S HILL.—Rev. Dr. HUGHES (Wrang. Cant.), who has passed over 300, has VACANCIES for the next Examinations. Classical, Science, French, German, and Drawing Tutors. He can also receive (quite distinct) younger PUPILS for a more extended course.—Ealing, W.

FOLKESTONE.—Mr. W. J. JEAFFRESON, M.A. (Scholar) Oxon assisted by a Cambridge Honoursman and a competent staff of Teachers, prepares for the Universities and for all Competitive Examinations. Pupils successful at the last Nine Examinations of the Line.

WESTGATE-ON-SEA, Kent.—W. THORNTON BULLOCK, B.A., Oxon (Classical Honours, Mods.), for Eight years Assistant-Master at Temple Grove, prepares BOYS for the Public Schools.—Terms, &c., on application.

EDUCATION (Thorough and Scriptural).—A BENEFICED CLERGYMAN earnestly desires to recommend a First-Class LADIES' SCHOOL. The Mansion is enclosed in its own grounds of several acres, in a beautiful and healthy situation near London. Professors and Lecturers. Advertiser's only interest in this School arises from his having had peculiar facilities for learning the Teaching Gifts and remarkable Moral Power of the Principal over youth, so that he thankfully committed his Daughters to her Training, and feels that he owes a debt of gratitude to Parents desiring for their Daughters Education thorough and safe, based upon the Bible.—Address, VICAR, Sissinghurst, Staplehurst.

A YOUNG GERMAN LADY of position desires to find a HOME where, in exchange for German and French, she can acquire ENGLISH. Address, Mrs. OLIVIE, Newton House, Farquhar Road, Upper Norwood.

TO LADIES of POSITION.—As SECRETARY or TRAVELLING COMPANION, a Gentlewoman by birth and education. A good Reader and Amanuensis, and an experienced Traveller. Excellent references.—Address, A. B., 41 Lansdowne Crescent, Malvern.

EVENING EMPLOYMENT WANTED by a YOUNG MAN, Three or Four Evenings a week, addressing Envelopes, Circulars, &c., or to assist a Tradesman with his Books, or any similar capacity.—Address, G. K., 8 Canal Terrace, Camden Town, N.W.

AGRICULTURAL and ESTATE PUPIL.—A GENTLEMAN, residing in Hampshire, will have a VACANCY after the 25th of March. A comfortable home, with unusual facilities for acquiring knowledge in Agriculture in all its branches, including the Cultivation of Hops, and the Breeding and Feeding of Stock, is offered; also the Management of Landed Estates. Highest references given and expected. For full particulars and terms, which will include the keep of a horse, apply to CHARLES E. COSTIS, Draycys, Farringdon, Alton, Hants. The Advertiser having an Australian connexion is able to offer unusual advantages to young Gentlemen wishing to Emigrate.

THE VICTORIA LADIES' CLUB (under Distinguished Patronage) for Ladies only, is NOW OPEN, at 25 Regent Street (corner of Jermyn Street), W.

Every convenience of a private house.
Terms, £2 2s. a year; Family Ticket, £3 3s.
Prospectuses and particulars may be had on application to the LADY MANAGER.

CORPORATION of LONDON.—RECORDS' CLERK.—The Library Committee of the Corporation of the City of London desire to receive APPLICATIONS for the office of Records' Clerk. Full printed particulars of duties and emoluments may be obtained at the Town Clerk's Office, Guildhall, E.C., at which place applications (in the applicant's own writing) and copies of testimonials must be lodged on or before the 11th day of March next.

Ability to read and translate Early Manuscripts in Norman French, Latin, and English with facility will be considered indispensable.

Guildhall, February 14, 1876. MONCKTON.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill. *Physician*—DR. EDWARD LANE, M.A., M.D. Edin. For Invalids and those requiring rest and change. Turkish Baths on the premises. Private entrance to Richmond Park.

OVERLAND ROUTE and SUEZ CANAL.—Under Contract for the conveyance of the Mails to the Mediterranean, India, China, Japan, and Australia. The Peninsular and Oriental Steam Navigation Company despatch their Steamers from Southampton, *viâ* the Suez Canal, every Thursday, from Venice every Friday, and from Brindisi, with the Overland Mails, every Monday.—Offices, 122 Leadenhall Street, E.C., and 25 Cockspur Street, S.W.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea-Water Service in the Hotel.

P. O. RICKARDS, *Manager.*

CHISWICK HOUSE and GROUNDS. A Series of TEN PHOTOGRAPHIC VIEWS taken by WILLIAM BEDFORD expressly for, and published with the special permission of, H.R.H. the Prince of WALES.

The Pictures are of the uniform size of 11½ by 9, and are issued, in the order of subscription, handsomely mounted on mounts, 23 by 17, and in portfolio. Price £3 3s.

MARION & Co., 22 and 23 Soho Square, London.

COLLECTIONS of PHOTOGRAPHS COMPLETED, Collated, Mounted, Titled, Bound into Volume, Portfolioed, or Framed.

Publishing Department on the Ground Floor.

PIANOFORTES at BOOSEY & CO.'S new and extensive Warehouse, 295 Regent Street, adjoining the Polytechnic, on the Three Years' System, from 21s. per Quarter, or on the best terms for Cash. Upright and Grand Pianos by Broadwood, Collard, Erard, Kirkman, Kaps, Lipp, Reinoech, Neupert, Berdux, Dolmetsch, Ascherberg, and all the most eminent makers. Boosey & Co.'s 25 Guinea Pianoforte in plain Walnut, Compass 7 Octaves. Unsurpassed for Cheapness and Durability. Boosey & Co.'s Short Iron Grand, 5 feet long, 7 octaves, trichord throughout, very durable, and excellent tone, £55, or on the Three Years' System, £2 10s. per Quarter.

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 1,062, Vol. 41. March 4, 1876 [Registered for Transmission abroad.] Price 6d.

END OF THE CARLIST WAR.

AFTER the loss of Estella and Tolosa, the cause of Don CARLOS had become visibly hopeless. The KING and his generals probably heard with satisfaction, and without surprise, that the Pretender had crossed the frontier and placed his person at the disposal of the French authorities. It was right that he should not be allowed to remain in France, though his presence even on the frontier would probably be no longer dangerous. His officers and troops have been faithful to the last; and the perfidy of MAROTO, who betrayed the cause of his grandfather forty years ago, has not been repeated. While the insurgents retire from the struggle without dishonour, the national Government is not hampered by the conditions of any convention. The victory has been complete; and, for the present at least, the Basque provinces will not be able to resist the partial or total abolition of their cherished privileges. Experience will show whether it is possible to administer permanently any other form of government than that to which the provinces have been accustomed. The greatest difficulty will arise when attempts are made to enforce the conscription, which is intolerable to the most warlike part of the Spanish population. The Northern provinces have during two years raised many more soldiers than would have formed their quota if the inhabitants had been content to serve in the Spanish army; but they are obstinately opposed to compulsory service, which is indeed more burdensome in Spain than in any other country. French and German conscripts are only required to serve at home in time of peace, and few of them are at any time employed beyond the limits of Europe. Spain has still large colonial possessions; and in Cuba a kind of civil war has been smouldering for seven or eight years. It will be difficult to raise a contingent in the Basque provinces for colonial service; and yet it is invidious to allow a special exemption to a disaffected part of the popula[illegible]. King ALFONSO'S Government in its present mood will perhaps find means of appeasing the religious susceptibilities of the Northern clergy and their adherents. The dominant party in the Ministry and in the Cortes favours the pretensions of the priesthood, although it has not been thought expedient to concede all the claims of Rome.

If any Carlist were acquainted with a well-known anecdote in English history, he might console himself by telling the victors, like the Cavalier after the battle of Worcester, that now they have done their work, and have leisure to fall out among themselves. The party struggles which may be expected to follow the termination of the war will be embittered by the return of Queen ISABELLA, whose friends and enemies will cause equal embarrassment to the Ministers. Her supporters, although they may not actively assert her pretensions to the Crown, must hold that her dethronement was wrongful as well as illegal. A much larger body will resent the repudiation by the Government of the results of the revolution of 1868. No Sovereign has at any time been driven from the throne more entirely on the ground of unfitness to reign. PRIM, SERRANO, and TOPETE would have been content to allow the QUEEN to retain the throne, if they had not found by experience that it was useless to effect mere changes of Ministers, as long as a corrupt and bigoted Court steadily maintained the same despotic and intolerant policy. It is not known whether the KING is likely hereafter to display ability or political independence. At present he is a boy, and his consent to the return of his mother renders it probable that he will fall under her baneful influence. She is herself not of a disposition to content herself with the ceremonial splendours of royalty. Through life she has shown, though generally in a wrong cause, determination and the kind of ability which is connected with obstinacy and cunning; and, even if she were herself disposed to keep aloof from affairs, it will be the interest of factions and of aspirants to power to court her alliance and to stimulate her interference. The extreme section of the clergy will not fail to remind her of the pious zeal which compensated, at the expense of her subjects, for her own personal eccentricities; and, if necessary, it will be easy to provide her with confessors and miracle-mongering nuns to direct her actions. It is also supposed that the most active and ambitious among the military chiefs has adopted the cause of the QUEEN.

The overwhelming majority which the Ministers have secured in the Cortes will be confirmed in its devotion to its patrons by the victory in the North. At present the Legislature is unanimous in recognizing the KING who had been tacitly accepted by the nation. CASTELAR himself took the oath of allegiance, though he at the same time objected to the imposition of political tests. In the present Cortes his eloquence will be ineffective; and it may be doubted whether he is still eager to establish a Republic. For the present there will be no disposition to discuss constitutional forms; yet it will be interesting to ascertain on some fit occasion which, of many impracticable Constitutions, is supposed to be in force. Universal suffrage may be endured in a country where every Government can with any kind of franchise return a Legislature consisting exclusively of its own partisans. If the Constitution of 1869, enacted after the expulsion of the QUEEN, is recognized as valid, all sects are entitled to freedom of religious worship, and the clergy are deprived of the exclusive control of education. No arrests or punishments are allowed except under due form of law; and by a clause in the Constitution it is expressly declared that it can never be suspended. In practice the Ministers have, after the example of all their predecessors, exercised an arbitrary power of arresting and banishing their opponents. Their own majority is expected to embarrass them by its support of the claims of the Cl[illegible]. The Universities are entirely under the control of the Church, and the Government is pledged to restore all ecclesiastical property which has not been already alienated. It is not known whether the Ministers have any definite financial policy. The unfortunate creditors, who have for some time past received no dividends may reasonably expect consideration after the restoration of peace. Political confusion, and civil war itself, have not prevented Spain from advancing in wealth and prosperity. The Government might largely increase its revenue by the adoption of a rational tariff, and it would at the same time discourage the contraband trade which will revive with the pacification of the frontier provinces; but sound views of political economy seem to be among the tardiest results of civilization.

The flourishes with which the partisans of Don C[illegible] affect to cover his final defeat are perfectly harmless. It is announced that the contest, which can scarcely be commenced under more favourable conditions, is abandoned but suspended. The unfortunate CHARLES surrendered, it is said, neither to his enemies nor to the French: but he voluntarily retired into foreign territory when the chances of war were for the time unfavourable. If he had wished to gratify a petty revenge he might have

caused his cousin some embarrassment by becoming a prisoner instead of a fugitive. Don CARLOS has come directly through France to England; but he will probably find a more congenial residence in Austria. It would have been inconvenient to pass through Germany, which has been justly offended by the outrages of his adherents, or to seek in Italy the protection of a heterodox KING whose son at one time wore the crown which Don CARLOS claimed as his own. It is not unlikely that he may be the last of the race of legitimist and absolutist Pretenders. The Count of CHAMBORD has almost ceased to maintain the fiction that he is hereafter to reign over regenerated and repentant France. The King of NAPLES and the banished Italian Dukes and their heirs are almost forgotten, although a Neapolitan Prince lately held without discredit a command in the insurrectionary Spanish army. Don CARLOS has not displayed either political or military ability; but he seems to have had the power of attaching to his person the population which associated his cause with the maintenance of ancient privileges. The promises which he from time to time addressed to the Spanish nation had the merit of candour. The representative of the male line of the Spanish BOURBONS never condescended to the profession of modern constitutional doctrines. On the contrary, he always announced the future restoration of the blessings which were enjoyed by Spain when despotism and religious intolerance had in the eighteenth century reduced the country to the lowest point of misery and degradation. The Spanish legend of a golden age of absolute royalty was even more baseless than the Jacobinical or the Napoleonist legend of France. In the midst of recurring civil wars, of national insolvency, and of chronic maladministration, Spain has made enormous progress since the days of CHARLES IV. If the nation had been reduced to its present state of uncertainty under a wise and vigorous Government, there would be little hope for the future; but almost any change will be an improvement. There is reason to hope that King ALFONSO may be better than his predecessors, and he cannot possibly be worse.

THE ARMY ESTIMATES.

IN the opinion of Mr. HARDY the army is in a satisfactory state; but to be in a really satisfactory state, it must be paid a good deal more than it has hitherto received. Mr. HARDY boldly takes issue with those who complain that most of our recruits are weak boys. He does not at all object to weak boys. He likes soldiers to join the army at seventeen and leave it at twenty-three, and he relies on the opinion of Sir GARNET WOLSELEY, who thinks that young soldiers are the best—the most obedient, and the most easily led. Our recruits are the youngest in the world; for in countries where conscription prevails, the authorities can choose at what age recruits shall begin their term of service; and France and Austria choose that twenty shall be the minimum age, while Germany is satisfied with nineteen. On the other hand, our recruits are, comparatively speaking, of a good size. The average height of the infantry of the Line is over five feet six, and this is a good height, and not below that of the best Continental armies. But we do not get enough recruits, and of those who join, too large a number will not stay. The higher the qualifications of each particular branch of the service, the more difficult is it found to get a class of men whom other employers of labour are specially anxious to get. The Guards are not up to their proper number, and desertions are very frequent in the Artillery, because the Guards and Artillerymen are required to be of more than ordinary height, and for such men there is a constant demand in civil life. The army is, in fact, not sufficiently attractive as a calling, and to make it more attractive Mr. HARDY proposes to spend money freely. There are, as he pointed out, two inducements to enlistment that may be held out. Those who are inclined to join may be made to feel that the army is a calling in which merit will command success, and that private soldiers who rise to be non-commissioned officers are rising to a really good thing. Here Mr. HARDY is wisely liberal. At present soldiers much dislike the road to promotion, as they have to pass through the lower stages, in which the duties are especially irksome, without any increase of pay. Henceforth every stage of promotion is to be accompanied with an increase of pay, and those in the highest stage will receive no less than sixpence a day extra. In the next place, the soldier may be made to feel that, even if he does not rise in the path of promotion at all, he is making a good investment by entering the army. Mr. HARDY offers him the prospect of laying by a handsome sum which will set him up when his six years of service are over. He is to have 3*l.* a year saved up for him; and so when he has finished his term of service he will have 18*l.* in hand, which will be paid to him with proper precautions, so that he may really have it in hand when he enters on civilian life, and may not have let it get into the hands of sharks at the moment of his discharge. The prospect of this considerable bonus at the end of his term of service will, it is thought, not only induce the soldier to enlist, but prevent him from deserting, as he will not like to forfeit what he has earned. The amelioration of the position of non-commissioned officers, and the creation of this tempting bonus at the expiration of six years' service, are the keys of Mr. HARDY's proposals. It is no doubt an expensive process, and there is an apparent inconsistency between the glowing picture which Mr. HARDY draws of the present state of the army and the request for large extra sums in order that the army may be made efficient. But if it is necessary to find the money, the nation will willingly find it, and will make proper allowances for the gentle officialism with which Mr. HARDY wishes to make an expensive change without giving offence to any one.

There are, however, many minor points in which Mr. HARDY carries out his principle of endeavouring to obtain increased efficiency by increase of pay. The Guards are to have an extra penny a day, which is also to accumulate for them. An increase is to be made in the sum applicable to the Yeomanry in order to render them serviceable light cavalry. A very considerable change is also to be made in the position of the medical department. At present it is found that good men will not become army surgeons. At a recent examination there were only fifteen candidates for forty-five vacancies, and the authorities had to take candidates who had been previously rejected. Mr. HARDY, as he himself says, now proposes most liberal terms. For ten years the surgeons are to have 250*l.* a year; and at the end of that time they are, if they choose to retire, to have a bonus of 1,000*l.* given them, with which it is calculated they may buy a private practice. If they stay on, their pay will gradually rise to 450*l.* a year, but at the age of sixty they are to be obliged to retire. For an active young man without capital, the career of an army surgeon will henceforth be by no means an unattractive one. Lastly, a considerable alteration is to be made in the treatment of the men who pass into the Reserve. The scheme of a Reserve consisting of men engaged in civil occupations, but with six years' training as soldiers, and who could be called out in case of an emergency, was an essential feature in the scheme of army reform introduced by Lord CARDWELL. But the conception was very imperfectly worked out. The men are paid in advance, and go wherever they please, under no real obligation to do anything for the money they receive, and without the authorities having any effectual means of getting at them. Mr. HARDY proposes to make the Reserve force much more of a reality. He wishes it to be clearly understood that the men of the Reserve are not civilians playing at being soldiers, but soldiers on furlough. If they are called they must come, and if they do not come they must be treated as deserters. They are not to be paid in advance, but are to be paid at the end of every two months, and are then to undergo a medical examination to test their fitness for service. Every autumn they are to be called out. As Mr. HARDY put it, he wanted to see them; and this seems a reasonable wish. In course of time it is calculated that the Reserve will contain upwards of 80,000 men; and if they can be really got at, this will be a most valuable addition to the strength of the army.

The English army costs a large amount of money, and the cost has lately increased rapidly, and will continue to increase. Three-quarters of a million are now to be spent on it more than was spent three years ago, and the burden of Mr. HARDY's proposals will not be felt at once, but will press with increasing severity as years go on. The cost of the Reserve, for example, is practically nothing at present, but will amount hereafter to a quarter of a million annually. But it is obviously much more economical to spend fourteen or even fifteen millions on a good army than thirteen millions on a bad army. What are really our prospects of having a good army, if we pay

all that Ministers like to ask? In point of numbers we shall have no shortcoming to complain of. The nominal strength of the army is now (counting the Militia and Volunteers) over 500,000 men; and with such a force Mr. HARDY calculates that we may expect to defend India and the Colonies, make an invasion very dangerous, if not hopeless, and have something like 50,000 men ready to send to any point where our military intervention in Continental affairs could be of use. It may be fairly admitted that, if these objects are attained, it is all that we can reasonably wish to attain. Mr. HARDY said that he was the most peaceful of War Ministers, and that all his schemes were passed for the sake of defence, and not of defiance. That the main object of the English army must be to defend what we have got is sufficiently obvious; and Mr. HARDY seemed perhaps unnecessarily anxious to remove any suspicion which foreign Powers may entertain, or affect to entertain, that the scheme of mobilization which was lately put forward showed a disposition on the part of England to become aggressive. It is not asking much when we entreat foreigners to believe that we are not planning anything very dreadful when we merely explain to the different sections of our army what they would have to do and where they would have to go if an invasion were threatened. As to the details of the scheme of mobilization Mr. HARDY spoke with becoming modesty. The scheme had been prepared after the most careful thought by the most competent advisers, and he had sanctioned it because it seemed to him a very good scheme, although he was quite willing to admit that experience would show that many improvements in it were possible. But, so far as its value depended on the Militia and Volunteers being ready and competent to play the parts assigned to them, Mr. HARDY spoke with the utmost confidence. Both these branches of the service have gone on getting steadily better, and Mr. HARDY is perfectly satisfied with them. Possibly he produced the impression of being a little too satisfied with everything; but he also produced the impression that it is reasonable to hope we may some day have an army up to our requirements, and that the administration of the army is in the hands of a Minister who is not afraid of spending money when it ought to be spent, who patiently and with impartiality listens to and tries to remove grievances, and who, though laborious in pursuing details, is not incapable of regarding the service as a whole.

IDLE FELLOWSHIPS.

LORD SALISBURY'S Bill for transferring a vast amount of property from the Colleges of Oxford to the University has attracted less attention than it deserves. The Duke of DEVONSHIRE was eager to extort a promise that a similar measure should be applied to Cambridge; and the number of persons who are interested in acquiring funds now belonging to others is so considerable, and the prejudices of the House of Lords are so exclusively enlisted on behalf of hereditary ownership, that the expropriation of a helpless and undefined class will perhaps be easily effected. The strangest eulogy on the Bill is the remark that it keeps clear of partition and spoliation. If partition means the division of property between its present owners and strangers, or if spoliation is the transfer of property from one set of owners to another, the Bill, or rather its purpose as explained by its author, includes both partition and spoliation. The Bill confers on a body of Commissioners, not yet named, an absolute power of applying the entire endowments of the Colleges to any purpose which they may deem beneficial either to the Colleges themselves or to the Universities. It may be confidently asserted that no legislative discretion of the kind has ever been entrusted by Parliament to any Board or Commission. The remark of the Archbishop of CANTERBURY, that the operation of the Bill would depend on the choice of Commissioners, though it is true, may be readily answered. The Government will of course appoint Commissioners who will adopt its own views; and consequently the substance of the scheme is contained, not in the Bill, but in Lord SALISBURY'S speech. The unlimited powers of the Commissioners will be controlled and stimulated by their sympathy with the extreme sect of University reformers. No occupation can be more attractive than that of disposing of 100,000*l.* a year in the mode which may seem most beneficial, without respect to existing rights or titles. CYRUS in the story long since made a similar award in the matter of his schoolfellow's coat; but, as the result showed, he was not vested with the arbitrary power which is to be conferred on the Commission. The Government proposes to disendow fellowships by the abolition of their present character as sinecures. The sums which will be rendered disposable are to be applied in part to increase the incomes of resident members employed in tuition, or, in other words, freehold annuities are to be so far converted into salaries. Lord SALISBURY in the first instance appeared to have decided on the abolition of all the places which he somewhat invidiously described as idle fellowships; and it was with a slight intimation of contempt that he afterwards encouraged the Archbishop of CANTERBURY to hope that a few idle fellowships might for the present be maintained, if the Commissioners who are to legislate for the Universities approve in certain cases of a system which will have been denounced by the Bill as an anomaly. The fellowships which are held by residents are, as far as the holders are concerned, not less idle than the sinecures enjoyed for a time by young barristers or men of letters. The successful candidate for a fellowship selects his career in Oxford or in London as he may be influenced by his tastes, his capacities, and his prospects, without the smallest reference to the demands of the College or the Universities. If he engages in tuition he is paid for his services, though undoubtedly the College endowments tend indirectly to diminish the cost of education. As a general rule, it may be assumed that the absentees work in their several vocations at least as hard as the residents; and Lord SALISBURY himself explained that he did not mean that the occupiers of idle fellowships were habitually idle. It is not to be inferred, because they are charged with no University duties, that the prizes they have won have no effect in promoting University studies.

In the Colleges of Cambridge the whole number of fellowships amounts to about 350. For many years past the Colleges have, at a considerable sacrifice on the part of the Fellows for the time being, been engaged in running out the renewable leases on which their estates were held forty or fifty years ago. The value of the fellowships has consequently risen far above the level which was customary under the obsolete system of fines and quit rents. The average income of a Cambridge Fellow may perhaps have reached 250*l.*, and the whole revenue of College fellowships may be 90,000*l.* a year. The abolition of non-resident fellowships would produce perhaps 40,000*l.* a year, leaving, after a liberal provision of professorships, museums, and libraries, valuable pickings for the residents who would profit by the spoils of their neighbours. Lord SALISBURY, when he says that no opposition is to be apprehended from the Universities, probably refers to the resident members, who seem to have been alone consulted. If the resident Fellows exercise the voice allowed to the Colleges in the choice of Commissioners, there is no reason to fear that they will be backward in the cause of reform or of appropriation. Of course vested interests will meet with that habitual respect which greatly facilitates projects of corporate disendowment. A life tenant may be trusted as guardian of the remainder which is vested in his children; but the holder of an income which passes by succession and not by inheritance probably cares little for the incumbent who will succeed to his post. The Government Bill alienates the patrimony, if not of the poor, at least of the professional classes and of educated families of narrow income. The so-called idle fellowships had, by a happy accident, been reserved from the general monopoly enjoyed by the rich to be transmitted to their children. During a long series of generations many of the most promising and most industrious among the youth of the country have been educated, often at the cost of heavy struggles, in the hope that, with the aid of College endowments, they might enter the competition of the liberal professions on equal terms with more wealthy rivals. In modern times, since fellowships have been exclusively the reward of merit, their holders have formed in early life a kind of intellectual aristocracy. There was a time when nearly every Judge in Westminster Hall had taken high honours at Cambridge, and had been helped in his early arduous labours at the Bar by the possession of an idle fellowship. It is not to be supposed that the system of sinecure fellowships is recent, though it may not have been originally contemplated by mediæval founders. PRIOR, after holding high official and diplomatic employments, maintained himself after the fall of his party on his fellowship at St. John's College, Cambridge. One of the most

notorious among the despotic acts of JAMES II. and his Ministers was the removal of LOCKE from his idle studentship at Christ Church, on the pretext of non-residence. Probably all the peers who were present shared Lord SALISBURY's indignation at the paradoxical tenure of an income for which no equivalent services are rendered; yet there are nearly as many instances of the same anomaly on a larger scale as there are members of the House of Lords. Collectively they own some millions a year of absolutely idle incomes. It is true that, as Lord SALISBURY said of humbler sinecurists, many of the number are not idle, but undoubtedly the percentage of idle peers exceeds the percentage of idle Fellows of Colleges. If it is dangerous to pierce below the surface and to meddle with the mysteries of social and political institutions, the fault is not with critics who think that the House of Lords is ill advised in throwing down the outworks which, in the form of corporate or temporary ownership, tend to protect the principle of property. If it were a question not of existing rights, but of the best possible application of a certain income, there are Dukes who could buy up all the fellowships in Cambridge; and yet three or four hundred successful competitors in severe academic struggles are perhaps as useful to the world as one average Duke. An argument which it is more expedient to suggest than to develop will not be appreciated by those to whom it is respectfully addressed.

> Rarus enim ferme sensus communis in illa
> Fortuna.

Community of feeling or sympathy with the class which is to be disinherited by the Government Bill can scarcely be expected from the House of Lords. The holders of idle fellowships have at least taken the trouble to pass some kind of examination; the legislators who are about to abolish Fellows for the future have taken the trouble to be born.

It will undoubtedly be possible to find professorships which may advantageously be endowed or augmented, and libraries and laboratories which may be usefully built; but the sixty fellowships of Trinity College, Cambridge, have directly and indirectly done more for science, learning, and education than all the professorships in the University. The holders perhaps divide among themselves 20,000*l.* a year, or the income of an average peer. It would be tedious, but not difficult, to extract from the record of their names since the beginning of the century a list of some of the greatest scholars and the greatest men of science who have been known in England. It must be confessed that their merely scholastic character has been adulterated by the admixture of writers like MACAULAY, and of Judges such as PARKE, POLLOCK, and MAULE. All these held idle Trinity fellowships which will be suppressed by the Government scheme. It may be doubted whether, after the Bill is passed, the quality as well as the number of their successors will not be reduced. The competition for fellowships will be confined to the students who are prepared to adopt an academic career. The more ambitious, and perhaps abler, majority will no longer have any interest in College endowments. An ulterior result will be the application by future Parliaments of a large portion of the College funds to purposes not even connected with the University. Lord SALISBURY calculates on obtaining 55,000*l.* a year from the suppression of fellowships at Oxford, in addition to a large sum to be derived from the prospective increase in the value of the property. The wants of the University are liberally estimated at 300,000*l.*, or about six years' purchase of the income to be obtained from the expropriation of Fellows. The large surplus will, as in the case of the Irish Church, hereafter form an attractive subject of dispute to Parliamentary theorists. Mr. GLADSTONE disendowed the Irish Establishment on grounds of general policy, contending that it was objectionable and mischievous. The present Government proposes to disendow and destroy one of the most characteristic, useful, and popular of English institutions, merely because its funds are supposed to be wanted for another purpose. Although fellowships were founded for the benefit of those who were to hold them, and not directly for the general use of the Universities, it is but reasonable that the Colleges should, if necessary, increase their contributions for University purposes. It may also be questioned whether the term for which fellowships are held might not in some cases be advantageously reduced. It is their misfortune to be selected as the victims of many different, and yet convergent, prejudices. The antipathies of great hereditary landowners to moderate incomes which follow another rule of succession will be seconded by the dislike of modern Liberals to old institutions and to endowments, while academic projectors will revel in devices for the new employment of funds which may be placed at their disposal. The extraordinary powers of legislation conferred by the Bill on a body of Commissioners would be unprecedented and revolutionary, even if the objects of the measure were as beneficial as the extinction of idle fellowships would be mischievous and impolitic.

THE BALTIC PROVINCES OF RUSSIA.

IT is very seldom that anything of what goes on in Russia becomes known in Europe. Its external history, its advances into new Asiatic districts, its alternations of menace and encouragement at Constantinople, may be followed by those who will take the pains to follow them. But of the internal history of Russia little is to be learned except that it is perpetually desirous to borrow money in Paris and London. The speech, therefore, of the CZAR to the representatives of the Baltic provinces has a special interest. It lifts the curtain for a moment, and allows us to see something of what is going on in the inner circles of Russian life. The Germans of the Baltic provinces have played a part in the government of Russia strangely disproportioned to their numbers. They have been the civilized few among the uncivilized many; the governors, with an inborn and carefully trained aptitude for governing, in the midst of a nation too backward to do much towards governing itself. They have supplied Russia with almost the whole of the machinery of its administration. And yet even now, when peace and prosperity might have been supposed to have greatly augmented their numbers, there are said to be only 300,000 of them altogether. Scattered German colonies bring the total of the German subjects of Russia to a million. Many of these Germans are fighting the struggle for existence in remote places, and must have too many cares and too little education to contribute any elements towards the governing classes. As Russia has advanced, Russians have been more freely employed in administrative posts; and among the Germans themselves with education and capacity sufficient to permit of their being usefully employed in the Government service, there are many who devote their lives to the management of their estates and local interests, or to commerce, or to teaching, and the ministrations of religion. It is therefore astonishing to find how very large a part of the highest official work is done by Germans; how many are the civil and military posts they hold, and how the number of Germans employed increases, the higher and more scientific is the work to be done. For example, both civil and military engineering appear to be almost completely in their hands. And as the Germans have done so much for Russia, it is natural that they should have established themselves in a position which, as contrasted with that of the other subjects of the CZAR, may be termed specially favourable. They are not like strangers in a foreign country in point of feeling or of language, for they are devoted to the Imperial family, whose Government has been in a great measure their creation, and they talk Russian as well as their mother tongue. But they have had their own customs, tenures, religion, teaching, and local administration left undisturbed. They have been a brilliant exception in the rude structure of Russian society, and they have been treated as a brilliant exception. While over the rest of the territories of the CZAR despotic force, making or trying to make all men of one faith and one creed, has spread like a sea, the Baltic provinces have been allowed to rear their head like an island which the waters spared. What touched or overwhelmed others did not touch persons so eminent, so loyal, so useful, and so able to take care of themselves as the Germans of the Baltic provinces.

Both their eminence and the distinctness of their position were symbolized in their eyes and in Russian eyes by the three provinces being placed under the government of a Governor-General. On the recent death of a Governor-General it was announced, to the horror and consternation of the Germans, that they were not to have a Governor-General any more. If this had been merely an administrative change, it would not have awakened any terrors in the German mind. A Governor-General for 300,000 souls certainly seems a grand, if not extravagant, arrangement. But the Germans knew that the abolition of this office was

the work of their enemies, and their enemies are the Russians. An intense jealousy of the Germans has long pervaded Russian society, and has increased every year with the advancing civilization of Russia. That such a small number of people should get hold of so many good things was mortifying to aspiring Russians directly they had passed the stage of utter and acquiescing ignorance. That the Germans were cleverer than themselves and more fit for office was a reflection which only added the hatred of superiority to the envy of prosperity. That the Germans were also more trustworthy was a thing to be felt, but not admitted. But this was not all. That there should be any exception to the prevalence of the new Russian system which aims at trampling out all differences of race and religion, and at making every subject of the CZAR a Russian, and nothing but a Russian, was in itself highly irritating. In the Baltic provinces themselves the Emperor NICHOLAS suddenly ordered all the Finns, who form the mass of the population, to be converted, and the edifying operation was carried out under the superintendence of an officer of hussars. Since the last Polish insurrection Poland has been gradually stamped out. It has been got rid of by the simple process of getting rid of the Poles. The Poles are made Russians from their cradles, and it is confidently hoped that in a very few generations even the memory of Poland will be obliterated. Why, ask the Russians, should not the Germans be treated like every one else in Russia? The waves must be made to sweep over their island. Their religion, their intellectual training, their local privileges, are, from the Russian point of view, an anachronism. They must have no more of the good things of office than they can claim in proportion to their scanty numbers. This feeling among Russians has grown so strong that the EMPEROR has thought it prudent to yield to it so far as to do away with the Governor-Generalship of the provinces, as being a symbol of superiority and independence. He has indeed softened the blow by addressing to the deputation from the provinces a speech of an unusually formal and solemn character, in which he assured his hearers that the abolition of the office meant nothing, and that the wishes of the Germans would be consulted henceforth as hitherto. But, immediately after his speech was delivered, Russian papers were permitted to say that the abolition of the office meant a great deal, and that the Russians fully intended to take care that the Germans shall know before long all that it means.

That the EMPEROR was perfectly sincere, and that he is not in the least anxious to alter for the worse the position of his very useful and very devoted German subjects, is in the highest degree probable. He cannot but know how great are the services which the Germans have rendered to his house, and for how many posts Germans are fit for which Russians are unfit. But on more than one occasion lately it has been evident that the EMPEROR cannot always stem or direct Russian opinion, and that he has to give way when he would like to be firm. The Russians will work silently, steadily, and perhaps surely, to abate the superiority of position which the Germans enjoy; and, in doing so, they have the advantage that they will be always appealing to two strong sentiments—the reluctance of the members of a rising race to own that others are more forward than themselves, and the feeling of equality which makes those who have come under a despotic system of administration wish to see others dragged under its influence. If, as is far from improbable, the Russians have their way, and a serious attempt is made to Russianize the Germans, more than one problem will be offered for the contemplation of Europe. In the first place, it will be seen whether the Russian system is really strong enough to grind down into a semi-barbarous uniformity, not an inferior or equal people like the Poles, but a superior people like the Germans. This might on other grounds seem improbable, but the scantiness of the German population must be taken into account. If the task the Russians are setting themselves were accomplished, and the Germans were reduced to the Russian level, then it would remain to be seen whether the Russians could go on without the Germans to lead them. The Russian system seems compact and strong, and the force of Russia, and its confidence in itself, are no doubt very great. But the Russians are a backward people, and have the enthusiasm and the arrogance of ignorance. The dissolvent elements of Russian society, the adventurous character of Russian policy, have hitherto been kept in check by a wise, patient, laborious administration. The hands have been the hands of the Muscovite, but the head has been the head of the German. It is not perhaps a very venturous guess to conjecture that Russia would lose many of its terrors for its neighbours, and much of its internal solidity, if the efforts of the present national party were crowned with success, and the Russians did everything for themselves.

MR. WARD HUNT'S DEFENCE.

MR. GOSCHEN'S motion on Monday with regard to the *Vanguard* was, it may be presumed, only a formal preliminary to more serious proceedings. During the recess the FIRST LORD of the ADMIRALTY had steadily abstained from affording any indication of his line of defence, and it was therefore necessary to ask him pointedly how far he was prepared to justify what had been done, and what were his grounds of justification. The whole case is now complete. The Minister has been arraigned, and has made his defence; the issues are distinctly framed, and all that remains is for Parliament to deliver its verdict. The attitude which Mr. WARD HUNT has chosen to assume obviously renders it impossible that the question can be left where it is. The *Vanguard* Minute is important, not merely on account of its immediate consequences, but because it embodies principles which may possibly exercise an injurious influence on the general administration of the navy. Englishmen are the last people in the world to cry over spilt milk, but they are naturally anxious not to have a repetition of what has recently happened, and the confirmation of a series of grave blunders as precedents for future application would undoubtedly be a national misfortune. What is done is done; and if Mr. WARD HUNT had shown any symptoms of perceiving the false position in which he has placed himself, and had given promise of more discreet action in the future, there would no doubt have been a general disposition to forget the past. Mr. HUNT has, however, put out of the question any compromise of this kind. He takes his stand upon the Minute in the most absolute and uncompromising manner, justifies it to the fullest extent, and will not admit that it is open to objection in any particular. Under these circumstances it is evident that the feeling of the House of Commons must be tested by a distinct vote; and it is impossible to suppose that the Opposition will shrink from so obvious and imperative a duty. Indeed the debate of Monday demonstrated plainly enough that on this subject Mr. HUNT, though he may have personally the compassion, has not the support, of his own party. He was left quite alone, with the help of two subordinates, to defend his policy. No Minister had a word to say for him, and speaker after speaker rose from the Conservative, as well as from the Liberal, benches to condemn his course of action. It is evident that a distinct understanding must be come to as to the principles on which the navy is to be governed, and personal considerations cannot be allowed to stand in the way.

Nobody questions, or has questioned, Mr. HUNT'S personal honesty of purpose and good faith. He no doubt believes in all sincerity that he has been doing the best for the navy; but the fact that, after all that has passed, and with ample opportunity for leisurely reflection, he should be still wholly unable to conceive how he has erred, and why the country should be dissatisfied, is perhaps the most conclusive proof of his incapacity for the position he occupies. His only solution of the mystery is that there is a general conspiracy of wicked people against him. It may be thought that it is rather beneath the dignity of a First Lord, on a grave question of policy, to throw stones at the reporters. Amid the clatter of a Guildhall dinner it is not very easy for a speaker to make himself distinctly heard, and it is ridiculous to suppose that it was from "malevolence" that Mr. HUNT had imputed to him the phrase about "one or two "more blunders," which he says he never used. Even if he did not use this particular form of words, his whole speech conveyed the impression of imbecile self-complacency in the face of national disasters; and indeed he is still, to all appearance, in the same obtuse and impracticable frame of mind. The burden of his apologia is from beginning to end, "I satisfied myself." He "satisfied himself" that his conduct had been throughout "intelligent, honest, fearless, "and impartial," and that it would be "mean, cowardly, "and contemptible" for a First Lord to stoop to the assistance of a professional tribunal in making up his mind on any question. He "satisfied himself" that Admiral

Tarleton and Captain Hickley were "blameless for the "disaster," and that, as he was satisfied, no further court-martial was required or could be permitted. And he seems to think that, as long as he is himself satisfied, everybody else is bound to be satisfied too. This is, in fact, the source of the delusions in which he has entangled himself.

It should be observed that there are two issues involved in the *Vanguard* controversy, which are quite distinct, and one of which is much more important than the other. There is a question whether the views of the Admiralty on the points of seamanship raised by the disaster are sound; but the other question is much more serious, and is, in effect, whether courts-martial are henceforth to be abolished in the navy, and their duties transferred to a small departmental Committee at Whitehall, sitting with closed doors, and taking such evidence as it chooses, without the check of professional or public supervision. We have only to consider how a proposal to suppress juries in criminal trials, and to leave the judges to settle verdicts for themselves *in camerâ*, would be received by the general public, in order to understand the alarm and indignation with which Mr. Ward Hunt's blow at courts-martial has been received throughout the naval service. What trial by a jury of one's countrymen, chosen at random so as to secure an unprejudiced and independent verdict, is to ordinary British citizens, a court-martial is to the officers and men of the navy; and this is what Mr. Ward Hunt is apparently doing his best to get rid of. He holds that trial by court-martial is a mere formal proceeding, which the Admiralty can at pleasure either overrule or dispense with altogether; and that the First Lord and his colleagues are entitled to act entirely on their own inspirations, without troubling themselves about the rules of legal evidence or the findings of subordinate tribunals. The First Lord has only to dive into his own moral consciousness, and that is enough. Thus, Mr. Ward Hunt, having, as he tells us, "made up his mind that Admiral "Tarleton is not to blame, felt bound to assert that opinion." This opinion, however, was, after all, only the First Lord's own opinion, was based on imperfect and indirect evidence—by the way, Mr. Hunt ingenuously confesses that "he was convinced from the first, though he did not "know the facts"—and was opposed to the views of an authoritative tribunal which had, up to a certain point, investigated the subject. It is true that Mr. Hunt's naval colleagues at the Admiralty supported him in his conclusions; but here we have three naval officers who have not heard the case deciding offhand against a much larger number of at least equally experienced and competent officers who had heard it, and even going beyond the limits of the trial—which was a trial of the *Vanguard* only—in order to give judgment on questions which had only incidentally been gone into. It is easy to imagine what would be said if in any ordinary trial the Home Secretary were not only to overrule the verdict of a jury, but to assume that various witnesses in the case had been all the time unconsciously on trial, and might be judicially acquitted or condemned without any further procedure.

It was universally expected at the time that there would be more than one court-martial; and that this was the original intention of the Admiralty itself is proved by the fact that specific charges were laid only against the *Vanguard* people, and that Captain Dawkins had the right of professional assistance and of summing up his case. No doubt, in the end, it is for the Admiralty to determine how far the finding of a court-martial shall be adopted; but a final revision, when inquiry has been exhausted, is very different from refusing to go beyond the first stage of an inquiry, and giving an offhand decision on imperfect evidence. Mr. Ward Hunt's theory seems to be that the Admiralty cannot, or ought not, to order a court-martial unless it has first made up its mind as to the positive guilt of the accused. A more preposterous idea it is impossible to conceive. It is clearly the business of the Admiralty to see that the fullest inquiries are made, and to make up its mind only when it has all the evidence before it. It is well known that officers who are sensitive as to their reputation frequently ask for a court-martial in order to clear away suspicion; and it is surprising, as was remarked in the debate, that in the present instance it has not occurred to Admiral Tarleton and Captain Hickley to adopt this course. It will be seen, therefore, that the really important question here is rather as to the course of procedure adopted in this case than as to whether the Admiralty was right or wrong in the views of navigation taken in the Minute. The Board was at this time in a position to decide only with regard to the *Vanguard*, and ought to have deferred a decision on the other parts of the case until further inquiry had been made, especially as on various points it was acting in flagrant opposition to the views of a highly competent court-martial. The balance of professional authority would seem to be completely against the Board on the question of the danger of high speed in a fog; and it is admitted that the Admiral gave an order for a change of formation which made the movement more troublesome than it should have been, and compelled the *Vanguard* and *Iron Duke* to race into position, in a way that would naturally tend to produce confusion. It appears that the Captains of these vessels each went below about the same time, before they had reached their stations; yet one is punished and the other wholly acquitted. Again, the fact that the *Iron Duke's* steam whistle was never sounded before the collision was passed over both in the Minute and in the First Lord's speech.

There can be little room for doubt as to the motives which led the Admiralty to bring the inquiries into the movements of the Reserve Squadron to an abrupt conclusion. The disclosures which had already taken place had produced a very painful effect on the public mind, and, if the investigation had been carried out, other scandals might have come to light. It would seem that the cruise of the squadron, as far as real practice was concerned, was little better than a sham, and that the supposed evolutions at sea consisted mainly in a round of gaieties in harbour. Indeed, out of the month only four entire days were spent at sea, and three of these were spent between Portland and Berehaven. The ships were underofficered and undermanned, and were sent hither and thither merely to make a show and cultivate a convivial popularity; and it is easy to understand the looseness and disorganization which would be apt to ensue. Indeed, there were signs of muddle and confusion on every side. The Admiral went wrong both in his order for a change of formation and in his fog-signal, which was fired from a gun too small to be heard; and then he set off unconcernedly for Queenstown without troubling himself as to how the other ships might be getting on in the fog. We also find two huge ironclads at a critical moment, with their Captains below, and left in charge of a couple of inexperienced youngsters, one of whom had only a year's standing as lieutenant, while the other had been only three months in a sea-going ship. A man blind of one eye served the *Vanguard* as look-out, while an important signalman on the *Iron Duke* was deaf in one ear. Mr. Hunt had no doubt, therefore, good reason to fear that, in the agitated state of the public mind, any further revelations would bring things to a crisis. The first resort of a weak and incapable administrator in a case of disaster is to try to hide it as far as possible. And this is the course which Mr. Ward Hunt has systematically pursued since he came into office. Whenever anything has gone wrong he has imposed silence, and tried to look as if nothing had happened. He fears to admit it even to himself. It appears that the Admiralty has agreed to pay compensation for the consequences of the collision between the *Alberta* and *Mistletoe*; yet the officers of the Royal yacht have never been brought before a court-martial, nor has the Admiralty given any intimation as to whether the rule of the road at sea is still in force. Again, when the *Monarch* ran down a Norwegian barque, 400*l.* was privately paid in compensation, and a public inquiry avoided. The recent peril of the *Iron Duke*, when she filled with water because certain valves which were marked "shut" were open to the sea, and nobody for some time found it out, has also been hushed up in a similar way, and the public is expected to be satisfied with the audacious assertion that "there was no possible "danger." With such a policy in systematic operation, it is not difficult to understand the uneasiness with which the administration of the navy is regarded by competent authorities.

RAILWAY PROPERTY.

ALL the English Railway Companies have declared their dividends, and nearly all have held their half-yearly meetings. In the majority of cases those shareholders who have not the opportunity of making independent calculations have probably been disappointed; but the

stagnant condition of trade necessarily affected the goods traffic; and the Southern lines, which depend chiefly on passengers, have been exceptionally prosperous. The extraordinarily high price of many railway stocks at the beginning of the year was not founded on reasonable estimates of profit. The discredit which had fallen during the summer and autumn on foreign loans operated strongly in favour of genuine investments; and the low rate of discount and of interest on bank deposits necessarily raised the value of railway shares. The heavy fall of prices which has occurred during the last month may be attributed partly to an additional demand for money in the general market, and probably in a larger proportion to dissatisfaction with the dividends which have been announced, and with the amount of new capital which is to be raised. The Midland Company alone proposes to issue 4,000,000*l.* in the current half-year, involving a perpetual charge of 180,000*l.* a year on revenue. A large part of the sum will be applied to the construction of new lines, which may be expected when they are completed to produce an equivalent income. The proposed outlay on additional rolling stock ought also to be remunerative; but it is not surprising that shareholders should regard with uneasiness so great an expenditure. The dividend of six per cent. is stationary, though the gross income represented by the weekly traffic returns has largely increased. It is now admitted that the experiment of abolishing second-class trains and first-class accommodation is at the most prospectively successful. The loss incurred by the Midland Company is less than that which it has inflicted on all the neighbouring Companies, because the first-class traffic has always been comparatively small. It may be conjectured that, if the immediate result had been foreseen, the change would never have been made. It is highly satisfactory to learn that railway passengers have not to apprehend a similar interference with their comfort on the part of any other railway. No other Company could have abolished the convenient distinction of classes with equal impunity. The Midland Company depends mainly on goods and mineral traffic; and when the line between Settle and Carlisle is in full work the Scotch traffic will add largely to the receipts, and eventually to the dividends.

The maintenance by the London and North-Western Company of its rate of dividend, notwithstanding the compulsory reduction of first-class fares to places in competition with the Midland, affords a remarkable proof of the soundness and of the great resources of the undertaking. The impending division of the West Coast Scotch traffic probably explains the fact that London and North-Western stock was lower in price at the end of 1875 than at the beginning. The speculators who control the share market are seldom accurate in their conjectures. As soon as commercial activity revives, the London and North-Western Company will probably find its revenue undiminished, notwithstanding the pressure of competition. It will also within a year or two acquire, in conjunction with the Great Northern Company, a share in the Derbyshire coal traffic, which has hitherto belonged exclusively to the Midland. The project of amalgamation with the Lancashire and Yorkshire Company has not been abandoned, though it has been judiciously postponed. The North-Eastern Company, which enjoys a monopoly from Doncaster to the Scottish Border, has not been able to pay its former rate of dividend. The depression of the coal and iron trades probably accounts for the result; and a dividend exceeding eight per cent. indicates reasonable prosperity. The Manchester, Sheffield, and Lincolnshire Company pays four per cent., which would, according to the statement of the Chairman, have been increased by one-half if rates, fares, and working expenses had been kept at the level of ten years ago. Like the London and North-Western and the Great Northern, the Manchester, Sheffield, and Lincolnshire Company has been materially injured by the policy of the Midland. The most serious evil which affects railway property is the increase of working expenses. Although the cost of coal has during the last year been comparatively moderate, both the rate of wages and the number of men employed have been largely increased. In this, as in other kinds of business, higher pay generally produces a diminution of efficiency and a relaxation of discipline. There is no reason for expecting any future reduction of working expenses; and it is more likely that the burden will become gradually heavier.

The Great Western Company has been compelled to reduce its dividend from five to four and three-quarters per cent. The result is the more discouraging because the strike of the South Wales miners commenced during the corresponding period of the preceding year. The iron trade has not since revived, and in some of the South Wales works it will perhaps not be resumed. It is only because the ordinary stock bears a comparatively small proportion to the fixed charges that the Great Western can afford to pay a tolerably creditable dividend. For the same reason the increase of prosperity which may fairly be expected will largely increase the income of the shareholders. The Great Western Board has lately adopted an ambitious policy which may probably have been well considered. If their schemes of amalgamation are sanctioned, the mileage of the Great Western Company will be by far the largest in the kingdom. By union with the Monmouthshire Company, the Great Western will acquire exclusive possession of the important port of Newport, and it will largely control the mineral traffic of Monmouthshire. The Company is already working with its own staff the Bristol and Exeter and the South Devon lines, forming the most direct route to Western Devonshire and to Cornwall. Although the Bristol and Exeter line has lately been provided with a mixed gauge, it is announced that the Great Western Company will establish or maintain a system of fast broad gauge passenger trains between London and the West of England. The object of the arrangement is to compete with the narrow gauge line to Plymouth, which will shortly form an alternate route in connexion with the London and South-Western line. It is generally thought that the Bristol and Exeter Company has secured advantageous terms for the transfer of its property, but it is possible that the control of the entire traffic may furnish an equivalent for a pecuniary sacrifice. The acquisition by the Great Western of the Devonshire and Cornwall lines is an instance of the kind of amalgamations which have often been favoured by Parliament. There will have been no interference with any existing competition on the part of the amalgamated lines. It may be a question whether competition of independent Companies will not be impaired.

The proposed amalgamation of the Manchester, Sheffield, and Lincolnshire Company with the North Staffordshire on equal terms is less easily explained. The North Staffordshire Company, though it has always paid a small dividend, has from the first found itself unable to deal advantageously with its powerful neighbours, and consequently its property has long been in the market. Many attempts have been made to obtain favourable terms of purchase or amalgamation from the London and North-Western Company, but it has been found impossible to agree. The Sheffield Company, which now extends from sea to sea, might be thought large enough to stand alone; but it seems to be impatient of its present limits. The shareholders who have just received a dividend at the rate of four per cent. can scarcely have been gratified by learning that their future partners have only divided two and a half. On the other hand, the North Staffordshire dividends have, on an average of years, been higher than those of the Sheffield. The London and North-Western and Great Northern Companies, which are now constructing a line between Nottingham and the North Staffordshire district, will probably not approve of an arrangement which will give the Sheffield Company control of the North Staffordshire traffic. On the whole, the intended union seems more advantageous to the smaller and weaker partner; but the shareholders of the amalgamating Company not unreasonably rely on the sagacity and foresight of their experienced Chairman. It is not impossible that the acquisition of the North Staffordshire may be preparatory to a larger scheme of amalgamation. The Sheffield Company itself is perhaps not irrevocably determined to maintain its independence. The railway property of England now pays from four to five per cent. on the capital expended. The return is certainly not excessive; and there is no reason to suppose that it will be largely increased. The constant and inevitable increase of capital for the provision of stations, sidings, relief lines, and additional rolling-stock will generally keep pace with the elasticity of traffic. In the meantime the Companies are not unprovided with volunteer critics and advisers. Mr. Bass employs an agent of his own to write pamphlets against some of the principal Companies in succession. The latest attack is directed against the Great Eastern Company,

which certainly has not attained a high degree of prosperity. Mr. Bass's emissary recommends a reduction of rates, an increase of wages, and an accelerating of trains as the most obvious forms of frugal management. He has learnt by gossip with guards, porters, or clerks that they think their superiors not clever enough, and that their own cleverness is not sufficiently encouraged. Perhaps some humorous shareholder with money to spare will investigate the system of brewing beer at Burton.

THE MINISTERIAL INTERREGNUM IN FRANCE.

MARSHAL MACMAHON has shown since the elections a prudent reserve which promises well for his conduct of affairs when the new Legislature meets. The sudden fall of the French funds was probably due as much to doubt how the Marshal would take the unmistakable condemnation of M. Buffet by the constituencies as to any real alarm at the victory of the Republican party. The Marshal's position is in itself a strong one, and on the Bourse it is probably believed to be even stronger than it is. So long as he co-operates with the Legislature, he can do pretty much what he likes; but, supposing that he were to separate himself from the Chambers, and to rely entirely upon the army, it is not so clear that he would be able to maintain himself in power. Not much is known of the real views of the army, and it is at least possible that Republicanism has made as much way among the soldiers and inferior officers as among the civil population. In that case the Imperialist or Legitimist or MacMahonist tendencies of the superior officers would be of little importance. Where an army has to choose its side between two parties in the State, the opinions of the officers who come most in contact with the men are more significant, whether as an index or as an influence, than the opinions of those above them. There is no reason, however, to believe that this speculation is of any practical value. Marshal MacMahon is not in the least likely to take the only step which would give it interest. It is true that he is a soldier rather than a politician, but he is probably fully conscious that anything in the nature of a *coup d'état* would undo all that has been effected since the war, and convert a party which is gradually unlearning its radicalism into a dangerous and irreconcilable faction. He is almost equally unlikely to accept the consequence which the elections seem naturally to entail on him. If the contest had taken place in England, the only choice presented to the Sovereign would have been the choice between M. Thiers and M. Gambetta; and the solution adopted would probably have been to make M. Thiers Prime Minister, with a seat in the Upper House, and M. Gambetta his lieutenant, with a seat in the Lower House. It seems safe to say that no such arrangement has ever presented itself to the Marshal's mind. To accept M. Gambetta as a Minister would probably strike him as a surrender of the Conservative interests which he has expressly undertaken to defend. There is not much danger, however, that the new Chamber will call upon him to do anything of the kind. The victors will probably have the wisdom to see that the Republic is still in process of consolidation, and that, while this process is going on, it is best that the Government should be administered by the most moderate section of the Republican party. There is nothing in the overthrow of M. Buffet which is inconsistent with this anticipation. M. Buffet was not hated because he was a Conservative Republican, but because he was supposed not to be an honest Republican. So far as Liberalism is concerned, there is scarcely a pin to choose between M. Dufaure and M. Buffet; yet the two have never been classed together, except possibly in some outburst of irreconcilable oratory, and the chances are that a Dufaure Ministry will command the acquiescence, if not the confidence, of the very men who have just overthrown M. Buffet. What is the ground of this distinction? Simply, that whereas M. Buffet was ready in his hatred of Radicalism to ally himself with the bitterest enemies of the Republic, M. Dufaure can be trusted to do nothing of the kind. Conservative as his Republicanism is, it is Republican as well as Conservative; whereas M. Buffet's Republicanism was of that easygoing type which could be Imperialist, Legitimist, or Orleanist by turns, provided that the supposed interests of Conservatism pointed in one or the other direction. If M. Buffet could even have restricted his truant affections to the last two [illegible] might have gone better with him. But the fact that the Imperialists were the natural enemies, because the natural successors, of the Radical Republicans, made them in M. Buffet's eyes the natural friends of the Conservative Republicans. The tie of a common hatred was all that he demanded. How far he was really prepared to go with the Imperialists it is impossible to say. Perhaps when the critical moment came he would have disliked M. Rouher as much as M. Gambetta. But he had contrived to make the electors believe that he thought even an Imperialist good enough to beat a Radical with, and the least enlightened constituencies had wits enough to see that a politician who could make common cause with the Bonapartists was not a fit Minister for a struggling Republic.

Still, even if M. Dufaure succeeds in forming a Ministry, and the majority turns out to be either more moderate or more tolerant than was at first supposed likely, there are difficulties in store for the Republican party. Hitherto M. Gambetta has been singularly successful in keeping his followers quiet. But it is hard to say how far his success has been due to the certain defeat which awaited them in the Assembly if they were not quiet. M. Gambetta was always able to tell them that, if they broke loose from the Conservative section of the party, they would simply demonstrate their own impotence. The Conservative majority in the Assembly could not be trusted to hang together when the Left were behaving reasonably; but it was always ready to reconstitute itself if the Left seemed at all inclined to run wild. This must have been a very great help to M. Gambetta when he had to counsel moderation and self-effacement. It was not merely ultimate defeat in the elections that he could point to as the certain consequence of neglecting his advice, but immediate and crushing defeat in the Assembly itself. Now, supposing that M. Gambetta, instead of leading a Parliamentary minority as he has hitherto done, finds himself in the new Chamber at the head of a Parliamentary majority, he will no longer have this consequence to point to. His followers will be able to argue that, though reserve and moderation were very proper qualities when a hostile Ministry was sure to be strengthened every time that these virtues were departed from, they are not equally appropriate when the Left has only to hang together to gain a victory over the Right and the Centre. Readiness to compromise is all very well when the only alternative is speedy defeat, but what is the object of displaying it when the alternative is certain victory? M. Gambetta will have an excellent answer to this reasoning if only his followers are wise enough to accept it. He will be able to tell them that the victory on which they count would be the certain forerunner of reverses greater even than those which have hitherto overtaken them. If the growing reputation of the Republican party for political good sense should be once more destroyed, it is doubtful whether it would ever revive. At all events it would be long before an opportunity of regaining it was accorded to it, and when the opportunity came a longer apprenticeship would be needed to enable the party to profit by it. It may be that the good sense of M. Gambetta's followers is sufficiently developed to dispose them to listen to this warning when they constitute a majority of the Chamber of Deputies with the same meekness that they showed when they were only a small minority in the Assembly. Still, the possibility of their evincing a different temper must be included among the elements which have to be taken into account when drawing the Parliamentary horoscope. Perhaps a better security for the continued success of M. Gambetta's strategy is to be found in the large proportion of new names among the deputies. These men will for the most part have formed their political character under conditions among which the duty of submission to M. Gambetta has been a good deal more prominent than it could be expected to be in the minds of the older Radicals. The Republican deputies in the new Legislature will certainly be returned in many cases by a different class of electors from that which returned the Republican members of the Assembly; and it is, on the whole, to be expected that the colour of their Republicanism will display a corresponding change.

THE INDIAN TARIFF ACT.

THE Indian Tariff Act of last summer has brought deserved rebuke on its authors, but unfortunately the blame has not been dealt out with sufficient dis-

crimination. Lord NORTHBROOK and his Council committed two signal errors, and both have been properly rebuked by the SECRETARY of STATE. But, to all appearance, it was not the fact that they were wrong on two points that aroused Lord SALISBURY's displeasure, so much as their omission to commit a third blunder. If they had repealed the import duty on manufactured cottons, they might perhaps have compressed the work of legislation into a single day, and retained the import duty on raw cotton, and yet have escaped with, at all events, a very much milder censure than has now been administered. It must be conceded that the manner in which the Tariff Act was passed was utterly indefensible. The imposition of new duties and the reduction or abolition of old ones ought never to have been effected at Simla, where the Legislative Council was unable to ascertain the opinions of the native and commercial members on matters so nearly affecting the interests which they severally represent. Lord NORTHBROOK's defence of the introduction of the Bill without notice, and of the passing of it without even a night's reflection, is strangely inconclusive. Indeed he scarcely seems aware that either the haste which characterized the whole proceeding, or the absence of the members who may be presumed to be specially qualified to take part in the discussion, is a matter that calls for explanation. He is only concerned to show that the measure was sufficiently urgent to justify him in excepting it from the SECRETARY of STATE's direction that all Bills shall be sent home for consideration before being submitted to the Legislative Council. Inasmuch, however, as he makes out no proper case for his action in this respect, he had probably no better defence to offer on the points which he leaves unnoticed. Still, Lord SALISBURY's despatch of the 11th of November, 1875, would hardly have been so severe if the matter of the Tariff Act had not displeased him at least as much as the manner in which it was passed. The latter question is disposed of in a few sarcastic sentences; the argument of the despatch is reserved for the former. Lord SALISBURY's sarcasm is, we think, happier than his reasoning. The case for the retention of the import duty on manufactured cottons is not overthrown by objections which seem founded rather on the unpopularity of the duty in Lancashire than on its inexpediency in India. No one contends that an import duty on manufactured cottons is in itself a blessing; indeed, if Customs duties ever are blessings, they are remarkably well disguised. All that has been urged in defence of it is that, India being a very poor country, it is necessary, if any considerable part of its revenue is to be raised from Customs duties, to tax a large number of articles; that Customs duties cannot be limited to articles which are not produced in India, since every imported commodity, except wine and some kinds of spirits, could be grown if there were a sufficient inducement; and that in a Customs tariff which, for this reason, wears an unavoidable air of Protection, the duty on manufactured cottons has some special recommendations. These recommendations are, that it is very little felt; that it helps to foster the early stages of a manufacture for which parts of India are very well suited, and the establishment of which will do a real service to the Indian people; and that no one has been able to propose a less objectionable, or even an equally unobjectionable, tax in its place. The fact is, we believe, that the rise of this new industry was due in the first instance to the ill-regulated desire of certain Lancashire manufacturers to have a monopoly, not only of supplying India with cotton goods, but of supplying India with bad cotton goods. If the quality of the goods sent from Manchester had been maintained, it might never have occurred to native merchants that cotton grown in India might be turned into calico without being taken to England for that purpose. A new industry thus grew up which by and by suggested to Indian financiers a new mode of raising money; and the fact that a Customs duty on imported cotton goods might incidentally benefit the struggling Indian manufacturer was in their eyes not a disadvantage.

Lord SALISBURY does not deny that, in the present state of Indian finances, no material reduction of Indian taxation is possible; and, while condemning Lord NORTHBROOK's policy in relation to the duty on cotton goods, he concedes the paramount importance of guarding the Indian Treasury from financial embarrassment. But he leaves the VICEROY no option as to the mode in which the duty is ultimately to be dealt with. Its entire removal, he says, should "not "be adjourned for an indefinite period, but provision "should be made for it within a fixed term of years." A duty which must be removed by a given date is usually best removed as early as possible. The circumstances of India are not likely to change in such a way as to develop sources of revenue at present undreamed of. The materials out of which the Indian Finance Minister will have to form the Budget of 1880 are probably much the same as those out of which he formed the Budget of 1875. Consequently Lord SALISBURY's direction is virtually a decree that the duty on cotton goods shall be abolished. The reasons which he gives for this decision are mainly two—that the maintenance of any duty tending to operate as a protective duty in favour of a native manufacture is inconsistent with a policy which "it is not open to HER MAJESTY's Govern-"ment to allow to be set aside without special cause in any "part of the Empire under their direct control;" and that the duty on cotton goods in particular "offers a false en-"couragement to the Indian manufacturer, which tends to "divert him from the efforts by which his success can "alone permanently be secured, and places two manufac-"turing communities upon whose well-being the prosperity "of the Empire largely depends in a position not only "of competition, but of political hostility to one another." As regards the first of these arguments, Lord SALISBURY is forced to admit that financial exigency may be a just ground for maintaining even an incidentally protective duty; but he hints that Lord NORTHBROOK has precluded himself from using this argument by reducing the tariff on other imported articles from 7½ per cent. to 5 per cent. When the Indian Government were in possession of resources available for the reduction of import duties generally, the opportunity ought to have been used for reducing this particular import duty, with a view to its ultimate abolition. The motive which led the Indian Government to reduce the remaining import duties to the level at which the duties on manufactured cottons had previously stood, was probably the hope that the change might ultimately lead to increased consumption, and by that means to an increased revenue; and from the point of view of Indian finance this seems a better policy than effecting an exceptional reduction in a particular class of imports. If no complaints had been heard from Manchester, it would hardly have occurred to a Secretary of State to blame a Viceroy for not reducing the duty on cotton goods below 5 per cent., and keeping the duty on every other import above 5 per cent. As regards the second reason, the native manufacturer may surely be left to take care of himself. If he is so stupid as to think that the imposition of a 5 per cent. import duty is all that is needed to give him the command of the Indian market, he must take the consequences. It is not the Indian manufacturer, but the Indian treasury and the Indian taxpayer, that have the first claim on the Government. If a tax which brings in nearly a million a year, and is neither burdensome to the consumer nor costly in collection, is to be abandoned merely to promote the commercial education of a particular class, it is plain that we have not got out of the vicious circle of Protection. Though we no longer tax the community to fill the manufacturer's pocket, we go on taxing it to improve the manufacturer's intelligence. It is to be regretted that the SECRETARY of STATE should be even supposed to have had Lancashire rather than England in his mind when overruling the financial policy of the VICEROY, just at the time when he is insisting on having earlier and more detailed information as to the proposed course of Indian legislation. But a change in the relations between the two Governments is too important a question to be entered upon at the end of an article.

THE USES OF CONTROVERSY.

THE new number of the *Contemporary Review* contains a very able and interesting article by Mr. Mark Pattison on the "Religion of Positivism," which is in fact, if not in form, a reply to a paper on the same subject in an earlier number of that *Review* by Mr. Frederic Harrison. We have no intention of explaining here exactly how far we agree with Mr. Pattison's view of the matter; still less do we propose to discuss that strange creation of M. Comte's brain in his declining years—which has found an energetic and by no means dreamy apologist, or rather protagonist, in Mr. Harrison—the Positive Religion. For ourselves we confess, though it may be a very old-fashioned, if not obsolete,

superstition, that the idea of religion has always seemed to us, as it does to Mr. Pattison, to imply the idea of worship, and therefore of an object of worship; and that the founder of a new faith who, "though he rejects God, will not therefore reject religion," appears to be twisting ropes of sand. We are almost inclined to add, what will perhaps be thought the still more humiliating confession, that if "the sentiments, the worship, the ritual, the sanctities, even the sacraments, of the old religion are to be retained," we had rather have them still associated with the old creed of Christianity than with the new creed of M. Comte. However, that is not the question before us just now. Nor shall we stop to inquire whether the reviewer is right in supposing that Mr. Harrison's Positivist enthusiasm is inspired, not so much by genuine faith in his new religion, as by antipathy to Broad Church theology, or at least to Broad Church theologians; though it is impossible not to feel a passing surprise at his perplexing jeremiade over the extinction of that school of thought. One cannot help thinking that if, since "Maurice and Robertson and Kingsley are gone," the Broad Church party itself "has melted into vapour," it is strange that a party consisting in its palmiest days of three divines—differing, we should have imagined, pretty widely from each other—should have exercised the influence and roused the apprehensions so widely connected with the Broad Church name. But this by the way. It is not on the controversy between the rival disputants in the *Contemporary* that we propose to comment, nor on the relative merits of "theosophy" and Comtism. Mr. Pattison opens his attack by laying down a very broad principle quite independent of the particular discussion he has in hand, and which indeed, if it were heartily accepted, would go far to prove that this and all other discussions of the kind are mere waste of time and trouble. The writer admits as much himself; he takes pains to assure his readers that "it is with full conviction of the unprofitableness of his undertaking" that he has nevertheless commenced and carried it out. But few men, least of all men of mark, care to expend their time and labour on what they really believe to be at best a mere *tour de force*, and we may be pardoned for doubting whether Mr. Pattison has not been hurried by a feeling of impatience or disappointment or irony into saying more than he seriously means. His recent criticism, in another periodical, on the present condition of Oxford studies, though containing a great deal of unquestionable, however unpalatable, truth, seems to betray a certain want of moral perspective in his way of looking at things which keenly interest him. Be that as it may, *litera scripta manet*. His thesis is worth examining, whatever may be thought of his consistency in putting it forward.

"Of investments of time writing controversy," we are told, "is one of the most wasteful. Your antagonist is confirmed by what you say in his own opinion. The readers, *if readers there are*, carry away no conviction beyond that which *they had before reading*—namely, that there is much to be said on both sides. No man was ever written down but by himself. Like the soldier of a democratic army, a controversialist is *chiefly dangerous to his own side*. There is no more barren province in the realms of print than that of 'answers' and 'replies.'" We have ventured to italicize a few words here and there in the extract for reasons which will appear in the sequel. Now it is obvious at first sight that there is much in this statement of the case which cannot be disputed. There are many writers on all subjects, controversial or other, who find few readers or none; and there are many readers who go away after all with only a vague impression that the point at issue is a difficult one, and that there is about an equal chance of one side or the other being right. There are many controversialists who are chiefly dangerous to their own side, whence it has passed into a proverb, "Save me from my friends"; and it is oftener true than not that "your antagonist is confirmed in his own opinion by what you say." But, after admitting all this, the question still remains whether it is true on the whole, and putting aside accidental causes, such as violent or ignorant or feeble methods of argumentation, strong popular bias on a particular side, and the like, that controversy is mere idle expenditure of time, which can produce no result. It is hardly enough to reply that, if so, controversial writing would long since have become extinct; for, on the one hand, the old and dreary saying, *quantuli sapientiâ regitur mundus*, may be applied to the literary as well as to the political world; and, on the other, many persons feel a keen enjoyment in controversy for its own sake, and independently of the effect which their arguments may be expected to produce. Their main object is rather to strike or startle than to convince, and if they can extort admiration for their own ingenuity or learning, they are comparatively indifferent to the triumph of their cause. Still, after making all necessary deductions on these accounts, it seems hardly conceivable that so many writers, who are not pedants or egotists or fools or mere literary prizefighters, should continue to cultivate the field of controversial discussion in philosophy, theology, politics, and other subject-matters, if experience had been found to bear out Mr. Pattison's estimate of the practical value of their labours. But the fact is, that experience does not bear it out, in the sense and to the extent here assumed. Dean Milman, after commenting on the gigantic controversial achievements of the schoolmen, observes, with less than his usual discrimination, that, "of those vast monuments of theology which amaze and appal the mind, *the sole remnant to* posterity is that barren amazement." The statement at best requires a very great deal of qualification, as he might have learnt from so uncongenial a critic of the schoolmen as Mr. J. S. Mill; but, in so far as it holds good, it is not at all because theological controversy, as such, is barren and unproductive, but because the particular points selected for dispute between the rival doctors of scholastic theology are trivial or have ceased to interest us. Thus, again, Dr. Döllinger says somewhere that four-fifths of the religious controversies among Christians are pure logomachies. Of course, wherever this is the case, controversy must be little better than ingenious hair-splitting, which is most successful when it most adroitly keeps out of sight the true nature of the matter in dispute. But that also is because the wrong subjects have been brought into debate, not because polemical discussion is in itself unprofitable. We have spoken of theological controversy as being that which commands the most general interest, and still more as being evidently the special branch of discussion immediately present to Mr. Pattison's mind in what he has written, and we shall for the same reason proceed to illustrate our meaning from the same subject-matter. But it need hardly be pointed out that what is true of one particular department of controversy has a general application to controversial literature as a whole.

We have said that experience does not bear out Mr. Pattison's sweeping indictment, as he has framed it. But there is something like an *ignoratio elenchi* in his way of framing it. If the main object of a polemical argument is to convince the particular opponent to whom it is addressed, no doubt it is usually a failure. Athanasius did not convert Arius to orthodoxy, nor did Laud convince Fisher of the truth of Anglicanism; and most likely neither of them anticipated any such result. But it does not follow that their labour was thrown away. The polemical writings of Athanasius are read by theologians to this day, and, what is more important, they very materially contributed to the ultimate victory of the orthodox over the Arian conception of Christian doctrine in the Church. Bossuet's famous *Variations* may not have converted the French or German Protestants whom at the moment he had in his eye; but the work has probably done much since then towards winning or retaining the allegiance of members of his Church. We need not, however, appeal to history in evidence of the inadequacy of Mr. Pattison's estimate of the facts. The Oxford movement of our own day offers a sufficient refutation of his theory. And here we must observe, by the way, that if it is a mistake to suppose that the crucial test of controversial success is the conversion of "your antagonist," it is also a mistake, though a less fundamental one, to speak as if no result worth mentioning had been achieved, when readers are left under the impression that there is much to be said on both sides. This is by no means always, or generally, "the conviction they had before reading," as Mr. Pattison puts it. The chances are, on the contrary, that they had, if not a conviction properly so called, a very decided prejudice one way or the other; and the writer who has persuaded them that the side to which they were—perhaps violently—opposed has as much to say for itself as the other, has done a good deal towards the removal of their antagonism to what he regards as the true view. Forty years ago the immense majority of Englishmen who thought at all on such subjects—we might add, of those also who did not—detested Popery as a mischievous or effete superstition, and regarded everything at all going beyond the somewhat limited range of Protestant opinion familiar to them as Popish, and therefore odious or contemptible. Now whether the change is for the better or the worse may be disputed, but there can be no doubt that a considerable change has taken place in this matter during the last two or three decades, and that it is mainly owing to what, for want of a better name, may be called the Tractarian movement—or, to put a more definite issue, to the writings of such divines as Dr. Newman, Dr. Pusey, Mr. Keble, and their associates. It may be quite true that these eminent divines have failed to convert their "antagonists," that is, the particular Evangelical, or Broad Church, or other opponents with whom they have from time to time been engaged in controversy. But it is not the less true that they have converted a considerable number of their readers to substantial agreement with their own views, and have convinced many more, whose previous range of vision was strictly bounded by the horizon of the Evangelical Alliance or the *Record*, that at all events "there is much to be said on both sides." Whether this result is beneficial or otherwise we are not now arguing, but we insist that it is a fact. And the fact, which is not an isolated, but a typical one, is fatal to Mr. Pattison's theory of the unprofitableness of controversial writing.

Many reasons might be given why controversialists seldom convince their antagonists, but it may suffice to state one here. It has been said with much force that a man may readily change an opinion which he entertains in his own mind, but the change becomes more difficult if he has avowed it, while he will obstinately adhere to what he has maintained in writing; and if he has committed himself still further by publication, the case is almost hopeless. Viewed in this light, a literary duel is pretty sure to end in a drawn battle. But conquest of this sort is not the object of controversy among reasonable disputants, any more than a Prime Minister or leader of Opposition expects to bring over his rival, then and there, to his own views by the most brilliant and masterly exposition of them. Yet his speech is not wasted, for it is addressed, in fact, not to the individual opponent he is answering, nor even to the Opposition benches, but to the outside public, who are not too heavily handicapped, so to speak, to be able to weigh its force dispassionately. And in just the same way a Roman Catholic, or Protestant, or High Church, or Low Church, dissertation is not really intended to influence the rival divine at whose arguments it is ostensibly aimed, and who is most likely

what Archbishop Whately calls "proof-proof" on the points at issue, but is an appeal to the bystanders, that is, to the religious world generally, to judge between the rival systems. And, when so understood, a controversial discussion need by no means be barren of result, except through the fault or incompetence of the controversialist who conducts it. It follows, of course, that mere personal sparring is usually stale and unprofitable, because it turns, not on some question of common interest, but on the meaning or value of the respective arguments of A and B, which can hardly be of much interest to any one but the writers themselves and their personal friends or admirers. There are whole volumes *e.g.* of Warburton's works which very few readers, whether they happened to agree with him or not, would fail to put down in sheer weariness before they had got through half a dozen pages, and from which fewer still would carry away any new conviction, except of amazement that so able a man should have wasted his time in composing them. But then Warburton is for the most part occupied, not professedly, but really, far more in demonstrating his own superlative superiority to his opponents than in demonstrating any principle, true or false, which is worth the trouble of mastering, and his principal work, though it is spread over six volumes, leaves much the same sort of impression on one's mind as Whately's *Historic Doubts*. But Mr. Pattison is speaking of *bond fide* controversy on questions of genuine human interest, such as the contest between Christianity and Positivism. And of such disputation we cannot agree with him that "there is no more barren province in the realms of print." We are not indeed quite sure, if we may judge from his example as well as his words, whether he is even entitled to say with the Irishman that he "has his own consent."

VIVISECTION.

THE Report of the Royal Commission upon vivisection appears to have given more general satisfaction than is often produced by such documents. The practisers of vivisection say that it exonerates them from the imputation of wanton cruelty. The opponents of the practice are gratified by the proposal that it shall be subjected to legislative restrictions. The irreconcilables are of course not reconciled; but scientific persons will be glad to observe that Mr. Hutton has signed a Report admitting the occasional advantages of vivisection, and the non-scientific world will be glad to observe that Messrs. Huxley and Erichsen have admitted that vivisection should be strictly regulated. The Report, in fact, establishes beyond all reasonable doubt some important points. It is quite clear that the extension of physiology necessitates a certain number of experiments upon living animals, and that a knowledge of physiology has been of great service both to men and beasts. One of the greatest of blessings produced by the progress of medical science has undoubtedly been the discovery of anæsthetics, and that discovery, as the Commissioners remark, was due in great part to the practice in question. We may take it as admitted by reasonable men on all sides that vivisection should not be absolutely abolished, and the only question is to what, if any, legislative restrictions it should be subjected. The next point clearly established is that there is little ground for complaining of the present practice of public physiological laboratories in England. The evidence all goes to show that the experiments exhibited are, as a rule, neither numerous nor cruel. Operations of a painful kind are usually performed with the help of some anæsthetic, and proper care is taken that the animals may endure no lingering torture. If the investigation had ever been intended as a criminal process directed against the teachers in public institutions, they would have been entitled to an honourable acquittal. Some of the writers upon their side are apparently inclined to regard the whole question from this point of view. "You accused the operators," they say, "of hideous recklessness to animal suffering. The accusation has been completely repelled. Therefore your whole case falls to the ground, and your demand for legislation must fall with it." This little artifice is familiar in all such controversies. Once divert the dispute from a question of probable abuses to a question of the personal character of A, B, and C, and your triumph is secure. Nothing is easier than to prove that every letter in the alphabet is an honourable, humane, and judicious person, and to infer that any restrictions upon him would be an insult. We may remark, however, that we have not even yet done justice to the evidence in behalf of physiologists. It is plain that they are all men of the most unimpeachably humane sentiments. They denounce any kind of useless cruelty as vigorously as Miss Cobbe could desire. We do not for a moment doubt their sincerity. We believe Mr. Darwin to be as humane as any man in existence; and when he says that he should regard the infliction of any unnecessary torture "with detestation and abhorrence," he is evidently uttering his most genuine feeling. Mr. Lewes, again, who has done more work in physiological experiment than almost any other Englishman, tells us he could never bear to perform upon cats or dogs. Every witness examined, in fact, with perhaps one exception, admits that useless cruelty to animals should excite the warmest feeling of moral indignation. When, therefore, we add that such cruelty should be restrained, if it can be restrained without injury to science, we have the whole weight of scientific authority upon our side.

head of the Brown Institute—a foundation intended for the relief and cure of animal suffering. On being examined before the Commission, Dr. Klein gave his evidence with admirable frankness; with such frankness, indeed, that he afterwards thought it desirable to insert certain emendations in the printed Report. The Commission held that the alterations went beyond the fair limits allowed to a witness; and they have printed the evidence in both forms. Asked whether he had any regard to the sufferings of the animals upon whom he operates, Dr. Klein replied, "No regard at all"—to which he afterwards appended, "for such little suffering as is in my operations." In the next answer he said that the operator has no time for thinking what the animal will feel and suffer. The amended answer introduces a judicious reference to anæsthetics. Now, whatever may be Dr. Klein's final view, it is plain that he was frankly stating a possible view, and one which we have seen explicitly defended. That view is simply that animal suffering is not to be regarded at all. The lower creatures are so many zeros. In calculating the sum of good and evil, their feelings may be neglected altogether. If anæsthetics are used, it is simply to make them lie still, not to save them from pain. Though the point is warmly disputed, it is a general opinion that the poison called curari has the effect of making animals motionless whilst leaving them sensible to pain. It is frequently used in laboratories; and there is a ghastly account of a French operation in which a wretched dog was by this means subjected to prolonged torture for many hours, though unable to howl or struggle. The drug was in this case used simply for the convenience of the operator, without the least thought of the sufferings of his victim. Last year Dr. Schiff, in answer to some complaints, gave the fact that his neighbours had not been disturbed by the howling of dogs as a proof there were no dogs in pain in his laboratory; he had previously stated in some published lectures that he had performed an operation on dogs, rendering them incapable of barking, in order to prevent their cries from "discrediting physiological study amongst the inhabitants of the district." This gives a very different explanation of the silence maintained. It is clear, then, that the humane dispositions of English physiologists are not always shared by foreign physiologists. Dr. Klein, in his unamended evidence, expresses the very principle for which Mr. Darwin most properly declares detestation and abhorrence. No animal should suffer needlessly, say the English physiologists with one voice. The sufferings of an animal don't matter so long as he can't struggle, is the opinion occasionally avowed by some of their foreign brethren. We know, too, that the opinion has been acted upon. The intense disgust produced by the reckless cruelty of Magendie a good many years ago prevented Dr. Sharpey from following his lectures after one attendance. Dr. Sharpey, then a young student, had, that is, so much humane feeling as to abandon the principal object of his residence in Paris. We may safely assume, then, that vivisection has been associated with principles and practices calculated to excite the hearty disgust of right-minded men of science. The abuses to which it may lead are not mere vague potentialities suggested by sentimentalists, but have been illustrated by actual experience. Ought we to guard against them by legislation?

The cruelty, we may say, may be shown either in experiments exhibited to learners without proper precautions, or in experiments undertaken from mere curiosity by incompetent persons—as, for example, by medical students—or in experiments undertaken by real inquirers for purposes of original investigation without due consideration of the circumstances. In each case there is necessarily a possibility of abuse. The public experiments, as we have said, exhibited in laboratories do not seem to be, in fact, conducted with any want of caution. It is possible, indeed, as we are told by so great an authority as Sir W. Fergusson, that cruelties are occasionally perpetrated in lecture-rooms. The strong *esprit de corps* of a profession naturally makes it difficult to obtain conclusive evidence upon such matters. Still we have no right to assume what has not been proved, and we can only say that, in spite of the general humanity of students and professors, there is a possibility of such abuses. The case is stronger in regard to the practice of vivisection by unauthorized persons. We have direct statements from Edinburgh and Birmingham that young men occasionally carry on experiments involving much animal suffering, from mere curiosity. It is useless to say in answer to this that all medical students are humane. Medical men generally are human beings, constituted, so far as we know, like other human beings. As such, there are good, bad, and indifferent specimens. They are accustomed to witness suffering, and to overcome the instinctive horror which nearly all men feel at the first sight of suffering. A medical man who did not overcome this feeling would be unable to stand the wear and tear of practice. In the normal case, however, the mere instinct of disgust is replaced by the reasoned desire to relieve suffering. The surgeon looks at a ghastly wound without flinching, but he does his utmost to effect a cure. There must, however, be some cases in which the deadening of the instinctive repulsion is not replaced by such reasoning humanity. A man of coarse fibre becomes simply curious to trace the consequences of injury. A man who is a brute may even, as Dr. Rolleston tells us, come to feel actual pleasure in the sight of "a living, bleeding, and quivering organism." This taste, he thinks, is "the unworked-out beast which exists in man." Such cases, we doubt not, are very rare; but they exist, and there is no reason that we know of why a man of this brutal variety should not occasionally become a medical student. In any case it is

ment; but, as the law stands, it seems to be doubtful whether a man could be punished for cutting up a dog or cat, if he did it out of curiosity, or, as he would call it, for scientific purposes. It is certain that he could not be punished for cutting up a rat, or guinea-pig, or other animal not under the protection of Martin's Act. Finally, we have the case of really scientific experiment. Here it is enough to quote Mr. Lewes's statement that the increasing interest in physiology leads to the incessant repetition of useless and cruel experiments, which he would wish to see restrained if (which, however, he does not think possible) the practice could be legally restricted without injury to science. Mr. Lewes shows with great clearness that the extreme complexity of the organism, and the consequent difficulty of disentangling the causes of phenomena, render the application of experimental methods to physiology a matter of great delicacy. It requires skill, forethought, and definite purpose; and evidently the practice of simply cutting up an animal to see what will happen is as indefensible scientifically as it is morally. It implies mere ignorant curiosity, instead of a legitimate desire for knowledge. Vivisection, in short, can only be turned to account by men who are good physiologists and skilful operators.

The only question, then, which seems to present itself is whether any legal restraint can be devised which shall punish the abuses of the practice, whilst leaving sufficient liberty to scientific inquiry. The law as it stands is clearly inadequate to punish abuses, if they occur; and there is evidence that they do occur in England, that they occur more frequently on the Continent, and that the increasing interest in physiology is likely to spread Continental practices to England. Under these circumstances, the resolutions of the British Association seem to indicate the most obvious limits within which the practice should be restrained. No experiment should be performed without anæsthetics which can be performed with them. No painful experiment should be permitted to illustrate a law already established, or, in other words, for mere purposes of teaching. Nor, again, should painful experiments be permitted in order that the operator may acquire dexterity. Finally, no painful experiment, even for purposes of investigation, should be permitted without proper precautions against the waste of suffering—that is to say, no such experiment should be performed except by skilled persons in proper places and with proper appliances. These principles, which simply embody the undeniable truth that the infliction of useless suffering should be forbidden whenever it is possible, are recognized in the Bill proposed by the Commissioners. All experiments upon living animals are to be forbidden except in the case of persons licensed by the Secretary of State, and the licence is to be withdrawable in case of abuse. We need not discuss the details of the proposed measure, upon which its success will no doubt chiefly depend. In a general way, however, it seems to correspond with the conclusions fairly derivable from the evidence. There will be a power, which at present is not clearly in existence, of punishing wanton cruelty; whilst, on the other hand, properly qualified persons, acting under a due sense of responsibility, will be allowed to pursue a practice the utility of which in competent hands is beyond all reasonable doubt. Whilst no sensible person would wish to throw obstacles in the way of genuine scientific inquiry, the public conscience ought to demand some security that methods so difficult and so liable to abuse shall only be carried on by competent persons. Some such plan as that proposed by the Commission seems to be clearly desirable.

CATTARO.

THE end of a purely Dalmatian pilgrimage will be Cattaro. He who goes further along the coast will pass into lands that have a history, past and present, which is wholly distinct from that of the coast which he has hitherto traced from Zara—we might almost say, if not Trieste, yet from Capo d'Istria—onwards. We have not reached the end of the old Venetian dominion—for that we must carry on our voyage to Crete and Cyprus. But we have reached the end of the nearly continuous Venetian dominion—the end of the coast which, save at two small points, was either Venetian or Ragusan—the end of that territory of the two maritime commonwealths which now forms the Dalmatian kingdom. After Cattaro and the small district of Budua beyond it, the Venetian territory did indeed once go on continuously as far as Epidamnos, Dyrrhachion, or Durazzo. But, for a long time past, Venice had beyond Budua held only islands and outlying points, and nearly all of these, except the seven so-called Ionian Islands, had passed away from her before her fall. Cattaro is the last city of the present Austrian dominion; it is, till we reach the frontier of the modern Greek kingdom, the last city of Christendom. The next point at which the steamer stops will land the traveller on what is now Turkish ground. But the distinction is older than that; he will now change from a Slavonic mainland with the half-Italian fringe on its coast to an Albanian, that is an Old-Illyrian, land with a few points that were once Italian here and there. It is not an arbitrary point that the dominion in which the Apostolic King has succeeded the Serene Republic comes to an end. With Cattaro, then, the Dalmatian journey and the series of Dalmatian cities will naturally end.

Cattaro is commonly said to have been the Ascrivium or Askrourion of Pliny and Ptolemy, one of the Roman towns which Pliny places after Epidauros—the Epidauros which was the parent of Ragusa—towards the south-east. And, as it is placed between Rhizinion and Butua, which must be Risano and Budua, one can hardly doubt that the identification is right. But though Ascrivium is described as a town of Roman citizens, it has not, like some of its neighbours, any history in purely Roman times. It first comes into notice in the pages of Constantine Porphyrogenitus, and it will therefore give us for the last time the privilege of studying topography in company with an Emperor. In his pages the city bears a name which is evidently the same as the name which it bears still, but which the august geographer seizes on as the subject of one of his wonderful bits of etymology. Cattaro with him is Dekatera, and we read *ὅτι τὸ κάστρον τῶν Δεκατέρων ἑρμηνεύεται τῇ Ῥωμαίων διαλέκτῳ ἐστενωμένον καὶ πεπλιγμένον.* We are again driven to ask, Which is the dialect of the Romans? What word either of Greek or of Latin can the Emperor have got hold of? At the same time he had got a fair notion of the general position of Cattaro, though he runs off into bits of exaggeration which remind us of Giraldus's description of Llanthony. The city stands at the end of an inlet of the sea fifteen or twenty miles long, and it has mountains around it so high that it is only in fair summer weather that the sun can be seen; in winter Dekatera never enjoys its presence. There certainly is no place where it is harder to believe that the smooth waters of the narrow lake-like inlet, with mountains on each side which it seems as if one could put out one's hand and reach, are really part of the same sea which dashes against the rocks of Ragusa. The Dalmatian voyage is well ended by the sail along the *Bocche*, the loveliest piece of inland sea which can be conceived, and whose shores are as rich in curious bits of political history as they are in scenes of surpassing natural beauty. The general history of the district consists in the usual tossing to and fro between the various powers which have at different times been strong in the neighbourhood. Cattaro—*τὰ κάτω Δεκάτερα*—was in the reign of Basil the Macedonian besieged and taken by Saracens, who presently went on unsuccessfully to besiege Ragusa. And, as under Byzantine rule it was taken by Saracens, so under Venetian rule it was more than once besieged by Turks. In the intermediate stages we get the usual alternations of independence and of subjection to all the neighbouring powers in turn, till in 1419 Cattaro finally became Venetian. To this day the land keeps many signs of the endless changes which it has undergone. We enter the mouth of the gulf, where, eighty years ago, the land was Ragusan on the left hand and Venetian on the right, and where the smaller commonwealth, with her strong fortress of Castel Nuovo, seemed to assert a supremacy over the whole of the inland sea by far the greater part of whose shore belonged to her mightier rival. But Ragusa and Venice between them did not occupy the whole shore of the *Bocche*; neither at this day does the whole of it belong to that Dalmatian kingdom which has taken the place of both the old republics. A little way beyond Castel Nuovo we come to the further of the two points where Ragusan jealousy preferred an infidel to a Christian neighbour. At Sutorina the Turkish territory nominally comes down to the sea; nominally we say, for if the soil belongs to the Sultan, the road, the most important thing upon it, belongs to the Dalmatian King. And if the Turk comes down to the *Bocche* at this end, at the other end the Montenegrin, if he does not come down to the water, at least looks down upon it. In this furthest corner of Dalmatia then political elements, old and new, come in which do not show themselves at Zara and Spalato. In short, on the *Bocche* we have really got into another region, national and religious, from the nearer parts of the country. We have hitherto spoken of an Italian fringe on a Slavonic mainland, at all events of Italian cities with a surrounding Slavonic country. On the shores of the *Bocche* we may drop those forms of speech. We can hardly say that here there is so much as an Italian fringe, or that Cattaro is in any sense an Italian city. We feel at last we have reached the land which is thoroughly Slavonic. Italian is more spoken in Cattaro than French or German, and that is about all that we can say. The *Bocchesi* at once proclaim themselves as the near kinsmen of the unconquered race above them, from whom indeed they differ only in the accidents of their political history. For all purposes but those of war and government, Cattaro is more truly the capital of Montenegro than Cettinje. And, along with a distinct predominance of the Slavonic nationality, we come also, if not to the predominance, at all events to the greatly increased prominence, of that form of Christianity to which the Eastern Slave naturally tends. Elsewhere in Dalmatia, as we have on the Slavonic body a narrow fringe of Italian speech, art, and manners, so we have a narrow fringe of the religion of the Old Rome skirting a body belonging to the New. Here, along with the Slavonic nationality, the religion of Eastern Christendom makes itself distinctly seen. Both in the city and in the district of Cattaro the Orthodox Church is still in a minority, but it is a minority not far short of a majority. At particular points the Orthodox far outnumber the Catholics. In short, when we reach Cattaro, we have very little temptation to fancy ourselves in Italy or in any part of Western Christendom. We not only know, but feel, that we are on the Byzantine side of the Hadriatic, that we have, in fact, made our way into the East.

And East and West, Slave and Italian, New Rome and Old, might well struggle for the possession of the land and of the water through which we pass from Ragusa to our final goal at Cattaro. We pass by the strait of Castel Nuovo into a gulf; another narrow strait leads us into an inner gulf; and on an inlet again branching out of that inner gulf lies the furthest of Dalmatian cities. The lower city, Cattaro itself, *τὸ κάτω*

Δενάτερα, seems to lie so quietly, so peacefully, as if in a world of its own from which nothing beyond the shores of its own *Bocche* could enter, that we are tempted to forget, not only that the spot has been the scene of so many revolutions through so many ages, but that it is even now a border city, a city on the marchland of contending powers, creeds, and races. But, if we once look up to the mountains, we see signs both of the past and of the present, which may remind us of the true nature and history of the land in which we are. In some of the other smaller Dalmatian towns, and at other points along the coast, we see castles perched on mountain peaks or ledges at a height which seems almost frightful; but the castle of Cattaro and the walls leading up to it, walls which seem to leap from point to point of the almost perpendicular hill, make surely the most striking of all the mountain fortresses of the land. The castle is perhaps all the more striking, nestling as it does among the rocks, than if it actually stood, like some others, on a peak or crest of the mountain. One thinks of Alexander's Aornos, and indeed the name of Aornos might be given to any of these Dalmatian heights. The lack of birds, great and small, especially the lack of the eagles and vultures that one sees in other mountain lands, is a distinct feature in the aspect of the Dalmatian hills and of their immediate borders, Montenegrin and Turkish. But, while the castle stands as if no human power could reach it, much less fight against it, there are other signs of more modern date which remind us that there are points higher still where no one can complain that the art of fighting has been unknown in any age. Up the mountain, during part of its course skirting the castle walls, climbs the winding road—the staircase rather—which leads from Cattaro to Cettinje. On it climbs, up and up, till it is lost in the higher peaks; long before the traveller reaches the frontier line which divides Dalmatia and Montenegro, long before he reaches the ridge to which he looks up from Cattaro and its gulf, he has begun to look down, not only on the gulf and the city, but on the mountain castle itself, as something lying far below his feet. From below, Cattaro seems like the end of the world. As we climb the mountain paths, we soon find that it is but a border post on the frontier of a vast world beyond it, a world in whose past history Cattaro has had some share, a world whose history is not yet over.

The city of Cattaro itself is small, standing on a narrow ledge between the gulf and the base of the mountain. It carries the features of the Dalmatian cities to what any one who has not seen Traü will call their extreme point; but, though the streets of Cattaro are narrow, yet they are civilized and airy-looking compared with those of Traü, and the little paved squares, as so often along this coast, suggest the memory of the ruling city. The landing-place, the *marino*, the space between the coast and the Venetian wall, where we pass for the last time under the winged lion over the gate, has put on the air of a *boulevard*. But the forms and costume of *Bocchesi* and Montenegrins, the men of the gulf with their arms in their girdles, no less than the men of the Black Mountain, banish all thought that we are anywhere but where we really are, at one of the border points of Christian and civilized Europe. The same thought is brought home to us in another form. The antiquities of Cattaro are mainly ecclesiastical, and among them the Orthodox church, standing well in one of the open places, claims a rank second only to the *Duomo*. Here some may see for the first time the ecclesiastical arrangements of Eastern Christendom, and those who do not wish to see a church thrown wide open from end to end, those who would cleave alike to the rood-beam of Lübeck, the *jubé* of Albi, and the *cancelli* of St. Clement, to the old screen which once was at Wimborne and to the new screen which now is at Lichfield, may still be startled at the first sight of the Eastern *eikonostasis* blocking off apse and altar utterly from sight. The arrangements of the Eastern Church may indeed be seen in places much nearer than Cattaro, at Trieste, at Wiesbaden, in London itself, but in all these places the Eastern Church is an exotic standing as a stranger on Western ground. At Cattaro the Orthodox Church is on its own ground, standing side by side on equal terms with its Latin rival, pointing to lands where the *Filioque* is unknown and where the Bishop of the Old Rome has ever been deemed an intruder. The building itself is a small Byzantine church, less Byzantine in fact in its outline than the small churches of the Byzantine type at Zara, Spalato, and Traü. The single dome rises, not from the intersection of a Greek cross, but from the middle of a single body, and, resting as it does on pointed arches, it suggests the thought of Perigueux and Angoulême. But this arrangement, to which one of the Catholic churches also approximates, is well known throughout the East. The Latin *Duomo*, which has been minutely described by Mr. Neale, is of quite another type, and is by no means Dalmatian in its general look. A modern west front with two western towers does not go for much, but it reminds us that a design of the same kind was begun at Traü in better times, but the inside is quite unlike anything of later Italian work. It seems like a cross between a basilica and an Aquitanian church. It is small, but the inside is lofty and solemn. The body of the church, not counting the apses and the western portico, has seven narrow arches, the six eastern ones grouped in pairs forming, as in so many German examples, three bays only in the vaulting. The principal pillars are rectangular with flat pilasters; the intermediate piers are Corinthian columns with a heavy Lucchese abacus enriched with more mouldings than is usual at Lucca. As there is no triforium and only a blank clerestory, the whole effect comes from the tall columns and their narrow arches, the last offshoots of Spalato that we have to record. For the ecclesiologist proper there is a prodigious *baldacchino* with other ritual features, and a good deal, as Mr. Neale has shown, might be gleaned from the inscriptions and records. The traveller whose objects are of a more general kind turns away from this border church of Christendom as the last stage of a pilgrimage unsurpassed either for natural beauty or for historic interest; and, as he looks up at the mountain which rises almost close above the east end of the *Duomo* of Cattaro, and thinks of the land and the men to which the path over that mountain leads, he feels that, on this frontier at least, the spirit still lives which led English warriors to the side of Manuel Komnênos, and which steeled the heart of the last Constantine to die in the breach for the Roman name and the faith of Christendom.

MR. RUSKIN AND WAKEFIELD.

MR. RUSKIN is the Don Quixote of the nineteenth century, who makes war against chimneys and manufactories instead of windmills. In the *Fors Clavigera* of last September and in several succeeding numbers the town of Wakefield has been the subject of unfavourable comment, and a correspondent goes so far as to hint that an accession of trade has its drawbacks as well as its advantages. In looking back to the old accounts of the town—unless, indeed, we are to suppose that each historian merely copied the words of his predecessor—Wakefield seems to have given the impression that it was a pleasant place to live in. "There be few towns in the inward parts of Yorkshire that hath a fairer site or soil about it," says Leland, and he adds that a right honest man shall fare well there for twopence a meal. Two hundred years passed over it, and left it very much the same. There is an engraving of it in Thoresby's *Leeds*, about 1715, "as it appears from London road." The chief features are, in the foreground, the river Calder with its weir and rushing waters, the long line of arches supporting the well-known Memorial Chapel on the bridge, and in the background the parish church with its lofty spire, around which are grouped clusters of houses and cottages, which cover the sides of the hill down to the river banks. Commerce is unrepresented; no one seems in a hurry; wood-cutting is going on in one corner, sheep-washing in another; two magnificently dressed gentlemen in Cavalier hats with fowling-pieces, a spaniel, and game-bag, are standing in the middle of the road, while a fisherman is wading across the river just above the weir. This is the spot which Mr. Ruskin speaks of as being now one of the two most frightful things he has ever yet seen. In 1770 the chapel was used as a warehouse for goods, and its "beautiful carving much defaced." Arthur Young, who was in Wakefield about that time on his Northern tour, gives an encouraging account of the town from an æsthetic point of view. Mutton and beef were 3½*d.* per lb., wages from 6*s.* to 14*s.* a week, manufacturer's house-rent from 40*s.* to 50*s.*; the trade of the place was very dull, and had been so ever since the peace. In 1801, the population was about 8,000; in 1811, 8,593; in 1821, nearly 11,000; and in 1838, Dibdin became eloquent and prophetical on its future:—"It is the most opulent as well as trade-stirring town in the West Riding of York, and contains a population of upwards of 15,000 souls. By this time thirty years to come, it will have quadrupled the number." Thirty-eight years have gone by, and Wakefield has only doubled the number. The chimneys have, however, more than kept pace with the population, nor is Dibdin's account out of place now of the "curling columns of dense and slowly moving smoke which seem to involve everything within its immediate neighbourhood in impenetrable obscurity." Had Wakefield but increased in the same proportion as its neighbours, the loss of the advantages given to it by nature would have been less felt. In all the great West Riding towns, Leeds or Sheffield or Bradford, there is a certain sense of power, of concentrated energy, which, though the sky is darkened and the air poisoned, strikes and impresses the mind. The shops are large, the streets are thronged, and the traveller will feel himself as much a mere unit as if he were in London or Manchester. But Wakefield is neither a commercial centre nor is it the county town. It has an historic past, and once had buildings of architectural merit.' It possesses a lovely natural site, and broad streets, which the competition of its rivals would have made as grass-grown as those of Ferrara if grass were a possible product. This useful herb will soon be a luxury in many parts of the West Riding.

It is sad to watch a district as it becomes a seat of manufacture. The little villages on the hill-sides soon encroach on one another, year by year demanding from the State fresh machinery to supply their social wants. The face of the land is changed. Refuse from the mill or colliery is plastered up into great unsightly masses. There is neither earth, nor air, nor water. Chemical constituents and filth of every description take their place, and the train must be made use of to obtain an illustration from natural history. First the rivers, then the trees, are poisoned. Neither can be replaced. In twelve years a plantation will not have grown as many feet; everything is either dead or dying. Long lines of rotten hedges, mended with disused wire ropes from the nearest colliery, separate the fields, while here and there dead trees fling their black arms to the sky. It is not worth while to fell them, so there they stand giving evidence of the past existence of life in the district. If a Hercules is required to clean the rivers, the roads might tax the powers of General Wade. It is nearly as dangerous to venture out upon the highways as it was in 1685, or in the days when Mary Wollstonecraft was upset four times on her journey from Havre to Paris. The roads are

full of holes and pitfalls, caused partly by the heavy traffic, partly by the fact that they are never mended, as it is the business of no one to attend to them. It is a sad irony to read now of such or such a town or village being pleasantly situated on the banks of its river. It is hardly possible to walk along the side of the stream. The blue scum which floats sullenly by has killed everything with which it has come into contact. There is no boat on the river, only here and there barges sunk at the back-waters and in the creeks, with their lines just above the water, telling of work done and homes lived in, but now gradually rotting away in filth. Further on a drain or beck discharges its contents, steaming with vapour, but the river is too foul to be coloured by the accession of any tributary, however filthy. Here is the evidence of a witness in the employment of the Aire and Calder Company:—"He saw a quantity of water containing hair and other sediment flowing from some tanks in the defendant's works over a large sump, and thence into Sheopscar beck. The sump was almost filled with a pulpy sediment. In the vicinity of the point where this discharge entered the beck there were several cart-loads of sediment in the bed of the stream. The sediment looked like lime and hair mixed. The water in the beck was white as far down as he could see." Not a bird is to be heard or seen; not that this is a matter to regret, as an ill-looking lad sneaks by with a single-barrelled gun. No animal life cheers the naturalist. No hare or partridge ventures near a population which would sally forth with every known implement of warfare to destroy it. The attested neighbourhood of a rabbit would empty a colliery for a week. Everything in your walks in such a country calls up some unpleasant association. The landscape reminds you of the illustrations in Dickens's novels; the ponds are those in which Bill Sykes tried to drown his dog. It is neither town nor country. Miserable cottages are being built in rows, to arrive at which you must plunge through a slough of black mud. Damp, ill-built, and ill-drained, disease clings to them, and family after family is compelled to leave. It is impossible to build houses with profit, and the result is overcrowding. Sanitary inspection is in many places unknown or useless. The Inspector is appointed as a matter of form, but is not called upon to furnish the Board with a report. The *Barnsley Times* gives an account of the village of Ardsley which is probably true of many others. The cesspools overflow the highways; an open field is used as a slaughter-house; so many people live in the same building that they have to go to bed in turns; while in one case thirteen people slept in one great round bed with their feet to the centre. Water is a necessity of life, but it does not exist. The river we have already described is the substitute discovered for it by the nineteenth century. The inventor of the University of Lagado, when he represented one of its professors as endeavouring to produce food by a process which we had rather not specify, little thought that the day would come when his description would be far from a satire. The town of Wakefield has solved the problem, and derives much of its sustenance from the source referred to. Paracelsus is said to have invented a perfume of the same material, and, were not the West Riding already so well supplied, enterprising tradesmen might turn their attention to a new means of profit. The time will come when a water merchant's trade will be a very important one, and when the manufacturer will set before his guests as a princely treat a bottle of some celebrated year, ascertained by analysis to be free from organic matter.

No sense escapes in the new order of things, and the shrill scream of the "buzzer" can be heard at a distance of miles. Thicker and more deadly smoke is vomited forth each year, and no attempt is made to deal with the evil. Lord Winmarleigh presented a petition the other day for an amendment of the Acts relating to noxious vapours, and said that he knew a property which had been all but destroyed by them. "The trees in it were like a forest of masts even at midsummer, and whereas there were formerly on it oaks worth 100*l.*, it would be difficult now to find in or anywhere near it an oak or other tree worth a hundred shillings." The Duke of Richmond, in reply, assured their Lordships that the Government felt the importance of the subject. If Goodwood were only between Leeds and Bradford, the Duke's assurance would be far more valuable. In those parts of Lancashire which lie around Wigan and Bolton and southwards to Manchester, the country is permanently disfigured, and we cannot believe that the Inspectors of Nuisances have ever put into execution the powers they possess. In the West Riding towns something has been done, though to a very small extent. In Huddersfield orders to abate the nuisance in a few cases have been issued, but with little or no effect. In Barnsley some of the principal manufacturers and colliery owners have been compelled to erect new chimneys. In Bradford over seven hundred informations have been laid against offenders, and penalties were inflicted and orders to abate by the borough justices were made in all the cases, the number of chimneys coming under the Act being about four hundred and seventy-six. In Halifax, owing to the measures enforced, there is a great improvement in the consumption of smoke. In Leeds a local Act of Parliament has been enforced. In Wakefield Mr. Ruskin will be interested in hearing that nothing has been done, and it is said that a meeting which was held many years ago to protest against the non-consumption of smoke resulted in a vote of thanks to the manufacturers who made it and brought trade to the town. Charles Lamb was heard to declare that his love of natural scenery would be abundantly satisfied by the patches of long waving grass and the stunted trees that blacken in the old churchyard nooks which you may yet find bordering on Thames Street. Wakefield, though not entirely consisting of Charles Lambs, shares the same opinion.

It may be asked, What is to be the end of all this desolation and destruction of life? Those who can undoubtedly will migrate in search of pure air and water, and evidences of refinement will become gradually scarcer. Houses descend very fast in the social scale in the neighbourhood of towns. In the agricultural counties the downward progress of the old manor-house is often slow. It has probably but one tenant, and when his farm-servants are dining together at the long oaken table in the central hall he is conforming more nearly than he is aware to the habits of those who lived there three hundred years ago. Occasionally the landlord comes there for a week's shooting, and the best bedroom, with its wainscoted panels and carved cornice, its Jacobean chests and faded Turkey carpet, is preserved from being the apple or the onion chamber. In the garden the yew trees and the walnuts are in their full glory, and the red brick walls that enclose them have all the delightful depth of colour which belongs to their age. A colliery, however, is not a helpful neighbour to the gabled hall. The lane that leads to it is dirtier than the dirtiest of those that lead to the Porta Salara at Rome. The porch is blocked up with bricks, and an open drain trickles along the slope in front of the house. The wall has fallen down which once inclosed the neglected garden, and half buried in the soil lies the stone escutcheon which bears the arms of the family that owned the property in the seventeenth century. There is no particular road anywhere; paths lie in every direction, for the collier is the typical crow that flies straight from point to point. In Lord John Manners's well-known poem, "England's Trust," the claims of our "old nobility" are advocated in preference to those of wealth, commerce, learning, and laws. Had his sentiment been expended upon the Tudor and Elizabethan manor-houses of the country, we should have been more inclined to sympathize with him. There is very little old nobility, and that little it is not easy to discover. In Yorkshire, and especially in the manufacturing parts of the county, property has changed owners very often. Two hundred years ago hardly a country house was in the hands of the ancestors of those who now hold it. The ordinary Yorkshire family dates back about two centuries, at which time it struggled out of some town to invest a little capital in land. The West Riding is very deficient in great houses built before the beginning of the last century. Hardly a fragment is left of Howley, the old home of the Saviles; and Temple Newsam, the only Elizabethan palace in the West Riding, will soon become lost in the smoke that surrounds it. If Mr. Ruskin can save a single tree or stream, he will have done a great deal of good, and if he can purify and educate Wakefield, nothing need appear hopeless to him. It is not given to every town to have a lunatic asylum with 1,400 patients and a gaol with 1,300 criminals. Lunacy, as is well known, is spreading out of all proportion to the increase of population, and in the event of the establishment of electoral districts Wakefield might hope for a second member. What might not then be expected from a town whose political history for the last forty years has been so bright, and has justified so well the hopes of those who extended the franchise? We can conceive of a millennium of universal happiness, when no man's house shall be without a buzzer, beer shall be the only available drink, and twenty persons shall sleep in the same round bed.

THE TREE OF KNOWLEDGE.

CERTAIN things, once the possession of humanity, have been lost to the world for ever—books, arts, and even lands; but we are in danger now of losing something more valuable than any of these—namely, the childhood of our children, the maidenliness of our maidens. Where are the children, as we knew them in days gone by, when simplicity and innocence were part of their charter, and to be a child meant to be fresh, unspoiled, and free from the taint of dangerous knowledge? Gone with the dream of the things that were and are not. They are not to be found in the precocious fledglings dragged about the Continent on autumn tours, or sitting at *tables-d'hote* with the governess at Nice while the father and mother are killing time and something more at Monaco. They are not among the miniature men and women who honour us with their presence when we give a juvenile entertainment, who come to criticize our Christmas-tree, which they seldom find good enough to praise, to pronounce our dance a bore, and our supper a sell; not among those unhappy little ones whom fond parents dress up in picturesque costumes for fancy balls, teaching them a self-complacency, a self-consideration far beyond their years, and only too easily learnt; and least of all are they among those still more unhappy little ones who act plays for the amusement of a grave and grown-up audience, and are stimulated by applause and excitement into a state of moral intoxication wherein all that makes youth lovely is lost for ever. For the cleverer they are for their years, the more disastrously their talent works on their natures; and one of the saddest sights known to us is that of a bright, pretty, vivacious little girl acting her saucy part with *aplomb* and assurance, failing in all that makes childhood most lovely just in proportion as she succeeds in her attempt to be some one else than herself.

By the very nature of things it is difficult for the children of the London fashionable world to preserve their innocence and childishness, victims as they are, now by association and now by exclusion, to the fast social life of their parents. From their

cradles they are subjected to the closest intercourse with nurses highly recommended by ladies anxious to get rid of them, and whose relations are to be found mainly in doubtful circumstances and shady quarters. Admitted to the questionable gossip of the monthly nurse when she enters the nursery circle on authorized occasions, and to the continued confidences of the resident nurses, who perhaps are gross through ignorance rather than through vice, the children are reared from the beginning under the shadow of the Tree of Knowledge, and are made free of the blossoms before their time comes to eat of the fruit. But if the nurses are not the wisest or best rearers of our children, fine lady mothers are not much better; and the dressed-up dolls whose velvet and point-lace are shown off to visitors in the drawing-room not unfrequently hear there more than is good for them of what, if they do not understand it to its fullest extent now, they think of hereafter and meditate on till they have found out the riddle. One kind of fine lady mother certainly leaves her children to be brought up by nurses without much assistance from her even for the show-hour in the drawing-room. They are circumstances of her existence which she takes care shall give her no trouble—conditions of her married life which represent a certain loss of time and so much personal annoyance, reduced by wise management to a minimum; and she has no desire to inflict on her friends a *corvée* repudiated by herself. So far her visiting world has cause for gratitude. But the mother whose maternal instinct is large and her reasoning faculties small, who prides herself on her love for her offspring, and insists that her acquaintances shall partake in her glory, adopts the foolish plan of having the children brought down to see all her visitors, and of converting her drawing-room into a small bear-garden, where every one is uncomfortable alike. The children are the axis on which all the conversation turns. You are expected to be interested when you are told of their gifts and graces—how Mary writes verses and Tommy makes music, and how sweetly Ellen and Harry repeat their poetry—just as you are expected to be polite when they pull your whiskers and fight for your watch, and to smile, as at a good acrobatic feat, when Jacky makes a flying leap into your hat, Harry scrambles on to your knee and informs the company that you wear a wig, and that he can see gold in your mouth. The natural sequel to such a course is that the position becomes untenable even for the most indulgent mother, and that the darlings are sent in the end to school, there to continue their education.

After the forcing-houses of the nursery and the drawing-room, their minds are now sufficiently matured to develop any seeds for evil and precocious knowledge that may drop into the untilled soil; and, on getting to their first school, it is generally enough for children to unite their experiences to get all the doubtful points cleared up which have exercised the youthful mind ever since the days of the first man. It is at this stage of their existence that we hear of mothers being shocked at the revelations made by their own children. Things which a generation ago were known only at the proper age, and when ignorance would have been folly, are whispered in corners among these callow investigators; and the one who has most to tell is the one who is king or queen of the rest. When the mother snatches her child from this unsatisfactory school, and that undesirable companion, she thinks perhaps that she has saved it; but the fruit of the Tree of Knowledge when eaten opens the eyes so that they can never close again, and what the mind has once received the memory can never reject. In the more advanced schools the dangers attached to unlimited confidences are so well understood that experienced matrons have recourse to various stratagems to prevent their possibility. Two girls will not be allowed to consort together for any length of time; and whispering and low voices are expressly forbidden. In walking out they must go in threes, or with a different companion for each day. Governesses have directions to watch all preferential couplings, and to break them up by adding a third to the party; not ostentatiously, so as to cause suspicion of motives, which would be as bad perhaps as the evil sought to be prevented, but with the craft of quietness, the hypocrisy of concealment—which we may cite as one instance of the lawfulness of doing good by underhand methods. Those schools are the best where the social feeling is most encouraged in contradistinction to the personal and individual; and in saying this we say all that need be told. Add to this, unresting occupation, whether it be learning or amusement, business or play—at all events, the disallowance of sloth and self-indulgence in every form—and the dangers of school life are reduced to their lowest possible sum, with so much good to come from wise guardianship and well-chosen employments as shall go far to neutralize what remains and keep the girls as fresh and pure as is possible in these odd days of ours.

Emerging then from a life of full occupation at school, girls are more to be pitied than envied on their first acknowledged entrance into society. They are scolded by captious fathers weary of milliners' bills and midnight revels; measured with a commercial eye by mercenary mothers, who regard them as so much stock for profitable sale and barter; snubbed by fastidious brothers, who sometimes find them in their way, and who generally are in the state to compare them unfavourably with some Cynthia of the minute in the ascendant. Competition with other girls, who have passed before them through the fire to Moloch, drives off the lingering shyness of the seminary, and the maiden blush vanishes with the appetite for bread and butter. Rinking on the one hand, and the shrieking sisternood on the other, divide the young womanhood of London between them, and the previous standards of right and wrong, once held so essential to the well-being of society, are completely overthrown on a little experience of the world and modern life. Idle gossip and questionable conversation are freely indulged in before them as a legitimate source of amusement by their mothers and their mothers' friends. The doubtful topics of the day are not only discussed in their presence, but discussed without reserve in a mixed assemblage of both sexes. The worst novels of the season lie on the drawing-room table, dogs'-eared at the strong passages; and the daily papers, whatever their contents, are passed freely from hand to hand. Women of advanced views make the drawing-room their forum, where they declaim with alarming minuteness of detail against the iniquities of men, and insist on the need there is of women meeting them on their own ground, with weapons sharpened at the same grindstone. Things which our grandmothers went down to the grave without knowing are discussed in the light of day, and in unmistakable terms, before our unmarried girls; and of all the feminine qualities, shame, delicacy, and reticence are the first to be discarded. The Tree of Knowledge—that upas tree of modern times—overshadows us all alike, and the sweetnesses of womanhood droop and die beneath its poisonous shade. Medical studies carried on in company with men; the country stumped in advocacy of woman's rights, which mean nothing more nor less than the revolution of society and violence done to nature; the country stumped too on questions which no woman who respected herself should touch with her little finger—what chance have our girls nowadays? Born, bred, and fostered in a vitiated atmosphere from first to last, can we wonder if men say sorrowfully that the English girl of tradition is a thing of the past, and if their apologists can find nothing better as an excuse than that they are like so many boys, with no harm in them, but no womanhood? For ourselves, we hold to the expediency of ignorance of some matters—ignorance of vice, of the darker facts of human history, of the filthy byways of life, of the seething under-current beneath the tranquil surface of society. We see no good to come of the early initiation of children into the knowledge that belongs properly to maturity, of the participation of women in that which belongs properly to men alone. We think that there is a charm in maiden innocence, in womanly ignorance, which no amount of bold trafficking in the secret verities of life can make up for, and we grieve to see the small account at which these old-fashioned qualities are reckoned. For eating of the Tree of Knowledge Adam and Eve were flung out of Paradise, and perhaps the analogy holds good for the children of men at the present day.

SOME NORTH LONDON MANORS

THERE have been many books made about separate London localities—books which may almost be considered provincial in their character, so little is there in them of enlarged views, thorough knowledge, or even ordinary research. They are usually mere compilations, and the comparative side of the history they tell is wholly neglected. To seek in such works for any account of the ownership of the ground, or any attempt to trace the descent of a manor, is but lost labour. If one looks for the word "manor" in the index, if there be any index, it probably does not occur. In one modern parochial history of this kind we found "Manners, Lord John, M.P.," but nothing nearer the object of our search. In truth, however, manorial history, difficult enough everywhere, is doubly difficult in the "metropolis," where manorial rights have been early abandoned, and where even greater obliterations may be noticed. For example, the great Hundred of Ossulston, which figures so largely in the Middlesex of Domesday, does not occur at all in the modern lists. It has not, so far as we have been able to ascertain, suffered formal abolition, but for all the purposes for which hundreds may be supposed to exist it has been blotted out. The hundred of *Gara* has become that of Gore. *Heletone* has been turned into Elthorne, and *Spelethorne* into Spelthorpe or Spelthorne. But *Ossulvestane* has disappeared, except from the Peerage, where it gives the Earl of Tankerville (a peerage of the seventeenth century) his second title. On the other hand, some modern hundreds are not mentioned in Domesday, and it may be supposed that, while the suburban portions have become the "metropolis," the more outlying parts have been absorbed into the newer hundreds of Kensington or Edmonton. More than forty distinct Middlesex manors—the majority of them in Ossulston—are mentioned in the Survey, and at least as many more sprang into existence in later years; but of several it may be said, as of the hundred in which they stand, that they are like a famous prebend of St. Paul's, the manor appropriate to which is written as *Consumpta per mare*; for Holborn is *consumpta per urbem*, and Portpool, once a canonical manor, is turned into Gray's Inn. Hoxton is overrun with houses, and so is the great prebendal manor of St. Pancras. The late Mr. Larking possessed a deed in which "Johannes Lestraunge dominus de Knockyn" gives his manor of "Holburne in suburbe Londonie" to his mother, Aline Lestraunge, and two other persons, apparently trustees, with remainder to the heirs of the said Aline; but who are the heirs of Aline now? There is something almost absurd in inquiring nowadays for a lord of the manor of Holborn. The governing body of Gray's Inn may perhaps be regarded as lords of Portpool—perhaps it is the prebendary; but in some cases a further element of confusion is to be found in the leasing of a manor, and especially

of a prebendal manor. Thus the Prebendary of Cantelowes is lord of the manor of that name, out of which he receives, or is supposed to receive, 20*l.* 1*s.* 5*d.*—all that his predecessors have left to him of an estate which now forms the principal possession of the infant Lord Camden. Kentish Town and Camden Town, and Lord Mansfield's beautiful seat at Caen (or Ken) Wood, are all upon the land of this magnificent prebend, to which a clergyman was very recently appointed. The manor of St. Pancras itself, in a like way, belongs in reality to Lord Somers; and here the hold of the prebendary is, we believe, quite honorary, and his lordship is as little acknowledged in Somers Town as that of his prebendal brother at Camden Town. The adjoining manor of Tottenham Court, or Totten Hall—in Domesday *Tothele*, where it is valued at 5*l.* a year—was kept in the prebendary's hands till the fourteenth century; but in 1343 John de Caleton was the lessee, and, after the lease had come to the Crown, it was granted in 1661 in satisfaction of a debt, and became the property, shortly after, of the ducal family of Fitzroy, one of whose scions, Lord Southampton, who is still more youthful than his neighbour, Lord Camden, is the present possessor. Ruggemere has disappeared bodily, unless it survives in the Bedford estate and is merged in Bloomsbury, though it is mentioned among the prebendal manors in the so-called "Domesday of St. Paul's" of 1251.

Whether the Convent Garden and the Long Acre, now parts of the city of Westminster, were originally included in the manor of Westminster, it would be hard to say. Geoffrey Mandeville had a manor of "Ea," which had been in the hands of Queen Emma, as guardian of a minor; but it was very small, and cannot be identified with the great threefold manor of the Abbey, now Hyde Park, Chelsea, and Ebury; but, if Covent Garden and Long Acre are eastern extensions of Westminster, it may be that "Ea" was a later addition to their western confines. Nor is the history of the Lacy estate quite clear; but, if the Earl of Lincoln's "Ian" was a manor-house, which is very possible, it formed the eastern boundary to the Abbey estate. We have already noticed that portion on which the "West-End" has been built; but long before Grosvenor Square was thought of, colonies of lords had settled in Drury Lane and Great Wild Street, and had extended themselves on the Abbey lands south towards the Strand, and north beyond the Oxford Road towards St. Pancras. Here lay the Royal manor of Lomesbury or Bloomsbury, granted to Lord Chancellor Wriothesley, Earl of Southampton, about the same time that John Russell, the first Earl of Bedford, obtained from the dying Edward the lands lying on the north side of the Strand which had been intended by the Protector Somerset to form part of the grounds attached to his new riverside palace. By the death of Lady Russell in 1723 the adjacent estates of Bloomsbury and Covent Garden were united, her son, the second Duke of Bedford, having already inherited from his grandfather the Abbey estate of John Russell. As the devoted wife of William Russell she has gained a place for herself in our history, and as heiress of the Wriothesleys she forms a prominent figure in the Bedford pedigree. It was in her time that Southampton Square, on her own manor, and Southampton Street, on her sons estate, were built, and it was by her sale at the nominal price of 1,000*l.* of a certain messuage known as Plough Court, in her manor of Bloomsbury, that a site was obtained for the great church and pyramidal spire of St. George's in Hart Street. This is the church to which the well-known epigram refers:—

> When Henry the Eighth left the Pope in the lurch
> The Parliament made the King head of the Church:
> But in George the First's time our good Bloomsbury people,
> Instead of the church, made him head of the steeple.

The King's figure used to be supported by a lion and unicorn, apparently endeavouring to scale the pyramid. But a few years ago it was found that they were about to descend, having perhaps determined to give up the attempt after trying it in vain for a hundred and fifty years. So they were carefully helped down, and an unmeaning festoon now occupies their place. The old figures should have been set on the vacant pedestals in front of the adjacent Museum. But Southampton Square has lost its original name, and has adopted that of the manor; and the Board of Works propose, it is said, to rename Southampton Street, Strand, also. But the family is abundantly commemorated, though it has now no residence on either estate. Southampton House stood where Woburn Place is now, having been built when Bedford House in the Strand was pulled down—namely, in 1704. It did not stand a hundred years, and was dismantled and the contents sold in 1800. There is a certain confusion in the nomenclature of the two districts, but any attempt to remedy it will only lead to greater complications.

The manor of Tyburn deserves a notice to itself, for in few of the suburban districts is there more to study. Those who are curious in the gradual growth of London have an endless field open to them. If a man is thoroughly acquainted with the history of London, he knows so much English history that a very little more will be enough. But it would not be easy to find any one who does thoroughly know the history of London, and it is very disheartening to the student to see the abundance of trash shot into the literary market year by year on the subject. The late John Timbs had much to answer for in this way, but he is often unjustly blamed. He did a great deal to encourage the study of London antiquity by making it popular, even though he was himself profoundly ignorant of all but the anecdotal side. But it is to the ignorance and carelessness of writers who profess profundity that we are most indebted for erroneous views. When Miss Strickland took up the stale suggestion that Charing was a corruption of *Chère Reine*, we cannot be surprised that she is followed by the smaller fry of London archæologists; and people who are content to take their authorities at second hand must be willingly deceived. But it is worse when writers who profess to go to the original authorities suffer themselves to make bad mistakes. When a gentleman who read a paper on Domesday at one of the early meetings of the Middlesex Archæological Society talks of the "Abbot of Barking," he merely shows he has either not seen the original or is ignorant of the most common Latin forms. But when he goes on to tell us that "the manor of Tiburn belonged to the Abbot of the Holy Trinity at Rouen," we are startled, and turn to the book for ourselves. In the end, we have to thank Mr. Griffiths for unconsciously pointing out a curious little fact. An "abbey of the Holy Trinity" is a rarity, and that of Rouen is overshadowed by the fame of the greater abbey at Caen, one of the most conspicuous examples of this dedication. "Hermodesworde," or Harmondsworth, belongs, we read, to the abbey "S. Trinitatis de Monte Rotom." The modern archæologist is wrong in giving Tyburn for Harmondsworth, but most of his fellow-topographers have been equally wrong when they concluded that the great "S. Trin. de Cadomo," which owned no manors in Middlesex, rather than the older foundation of Abbot Gosselin on St. Catherine's Hill at Rouen, was the abbey here mentioned.

GOOD CHINA AND BAD PICTURES.

THE report of a recent trial at the Old Bailey may furnish useful matter to some novelists. An Austrian witness deposed that at his first interview with one of the prisoners (Phillips) at the bar, he really believed him to be the son of a lord, or at all events a person of position, from his mode of speaking; and this impression was confirmed by finding that he occupied a suite of rooms "furnished with simple elegance" in the Albany. There were also pictures in these rooms, and a large library. The witness had brought to England a valuable service of Sèvres china which he was commissioned to sell, and he parted with forty-four pieces out of a hundred and five which made up the service without receiving anything for them beyond a few pictures of small value. His evidence was directed to explain how he came to allow himself to be thus cheated. Phillips showed him a picture which he had previously spoken of, and informed him that a lord had offered 2,000*l.* for "the Poussin," but he, Phillips, wanted 3,000*l.* Phillips then explained to the witness his "project" for buying the service, which seems to have been rather a project to obtain from this confiding Austrian the service or part of it without payment. In the first place, Phillips spoke like the son of a lord; next, he was living in "simple elegance" in the Albany; and, further, he stated that a lord had offered him 2,000*l.* for "the Poussin." He also mentioned that his father was a man of fortune, a member of a yacht club, who intended to go up the Mediterranean in his own yacht, and would certainly lend his son 5,000*l.* or 6,000*l.* He added that his mother and sisters were coming to town from Ryde, and that this would be an excellent opportunity for showing them the china. The polite Austrian suggested that the ladies might come to his rooms, but he was told there would not be time for that before they returned to Ryde. Accordingly the Austrian went to the Albany, taking with him a box containing forty-four pieces of the china. The account he gives of what passed there is imperfect and disappointing. The ladies do not appear upon the scene, but there is further talk about the lord and the father who keeps a yacht and will lend money, and in the result the Austrian comes away leaving behind him the forty-four pieces of china, but carrying with him "the Poussin," and having given a receipt for it written on paper bearing a coat of arms and the motto "Vincit omnia veritas." It was perhaps from imperfect knowledge of English habits that the witness failed to explain whether the coat of arms with this beautiful motto belonged to the man who spoke like the son of a lord or whether the paper was merely part of the "simple elegance" of the chambers in the Albany. However, he had parted with the china, he had got "the Poussin," and a van followed him to his door bringing five other pictures. He understood that he had made a "provisional exchange" of china for pictures as a guarantee until Phillips should pay him. Next morning he went again to the Albany, but could not get in, and no nobleman came to buy "the Poussin." He received a letter stating that Phillips was at a hunting party at Beckenham, but he never saw him again until he appeared at the Bow Street Police Court. An expert stated that "the Poussin" was a copy, and not a good copy, just as we may suppose that Phillips was a copy, and not a good copy, of a nobleman. The "Galatea" was "a nice thing for a man who had no judgment to hang up." Taking the six pictures together, 190*l.* was about their value. The prisoner's father was called as a witness against his son, and was obliged to admit that he lived at Weymouth and was a general outfitter, that he never lived at Ryde, and never kept a yacht. He may perhaps have sold stores to those who did.

The principal witness admitted on cross-examination that he had pawned portions of the china to obtain money for the expenses of himself and family. One piece of the china was in Paris at the time of the trial. It was not sold or pawned, and when he liked to go to Paris with 60*l.*, he could have it back again.

He had deposited another piece with a dealer for 500 francs to enable him to return to London. Prince Repnine, to whom the china belongs, had taken this piece out of pawn. The witness admitted that there had been other pawning transactions of considerable amount. In the euphemistic language of the counsel for the prosecution, this witness had been unfortunate in boarding-school arrangements at Trieste in 1859, and in 1864, in consequence of that misfortune, he gave up a considerable sum to his creditors. Altogether he seems to have seen a good deal of life, and scarcely to have been the person to believe in lordly looks and talk of a wealthy father, and of "the Poussin," and the lord who would buy it. Nevertheless, it is not suggested that there was any collusion between him and Phillips, although it is believed that Phillips was the tool of others. To talk a child from his bread and butter would be nothing apparently to the task of persuading this Austrian to part with his employer's china without getting money for it. He might have pawned these pieces as he did others, and thus have got hard money instead of doubtful pictures. There must be something in the air of the Albany that promotes confidence between men.

The only person deserving of sympathy in this business is the landlady of the hotel where the Austrian agent of Prince Repnine resided. He owes her a bill of 200*l.*, and "the Poussin," together with the "Triumph of Galatea," the "Procession of Cupids," and "Galatea and the Satyrs," and another picture described as "Reine Elizabeth nominant son successeur, par Smirke," are, we believe, at this moment in the landlady's possession, and she, it may be conjectured, would be glad to know what to do with them. The only suggestion that occurs to us is that she should refer to the second volume of a recent novel called *Harp and Crown*, where she will find a particular account of the method of disposing of "Linnells" among millionaires of Manchester and New York. The authors might perhaps be induced to impart to this ill-used landlady the precise address of the German whose entire dealings are with "nice things for a man of no judgment to hang up." That dealer, we may be sure, would gladly purchase these five pictures for the amount of the landlady's bill; for, as Mr. Colnaghi said, in answer to Serjeant Ballantine, a man not a first-rate connoisseur may mistake copies for originals; and it might be added that a man who has a large house and a deep purse may be willing to adorn his walls with "the Poussin." The landlady may possibly be threatened with litigation by creditors of Phillips, if they think it worth their while; but that is a remote contingency. It might be contended that the "provisional exchange" of china for pictures having been avoided by the seizure of the china and its delivery by order of Court to the owner's agent, the pictures belong again to Phillips, and that as against him or his creditors the landlady could not detain them. Supposing this to be contended, a question would arise like that about the piano which Messrs. Broadwood lent to a professional musician who occupied rooms at an hotel and quitted them without paying his bill, leaving the piano there. The general rule is that an innkeeper has a lien only on those things which he is bound to take in, and he is bound to take in those things only with which a person ordinarily travels, and, said the Court in that case, "a man does not usually travel with a piano."

The persons who are supposed to have prompted Phillips to commit this fraud have been so lucky as to keep out of the law's grasp. Only Phillips and a porter named Cohen were put on trial, and as Cohen was acquitted, it followed that Phillips could not be convicted of the "conspiracy" charged against them, but no doubt he was also indicted for obtaining valuable property by false pretences. We need hardly remark that it is not a criminal offence to speak like the son of a lord, or to live in chambers furnished with "simple elegance," and of which the rent is paid with considerable irregularity, in the Albany. As regards statements that one has a mother and sisters living at Ryde, and a father who keeps a yacht, our opinion would be less confident; but any man, so far as we see, is entitled to believe, or to say that he believes, that a lord will call at his rooms next day, or that that lord will be fool enough to pay 2,000*l.* for "the Poussin." But whatever may be done in novels by German dealers, the business of selling or passing "copies" of Linnell or Poussin for originals is dangerous in real life. The artist, if he exists, who could paint a "Linnell" so that Linnell would say that he must have painted that himself, although he forgot when, receives, it may be feared, only a poor and precarious remuneration for the exercise of his talents. The millionaire who feels called upon to have a taste does not care to adorn his walls simply with pleasing pictures. He must have the prospect of being known during life and remembered after death as the possessor of unquestionably genuine works of particular masters. Homer makes Ulysses describe for the information of the shade of Achilles the funeral games which were celebrated in that hero's honour, and it would surely be interesting to the soul of a deceased connoisseur to be told the prices which his pictures realized at Christie's. An eminent man sometimes learns from premature publication of his "Life" what will be thought of him after death, but there are no means of knowing what value will be put upon his art collections. The prisoner properly received a severe sentence on the principle on which horse-stealing was formerly punished capitally. There are now many millionaires, and all desire to buy Linnells and Poussins, while only a few can tell a copy from an original. Horses must be turned out to grass, and in the night they may easily be mounted and ridden away. If the result of these proceedings be that the service of 105 pieces has been all recovered for the owner, that is matter of congratulation both to him and to all lovers of art. Perhaps the value of this china may be increased by the perils it has escaped; and certainly a high price will be required to pay for such an expensive agency.

A HOLE AND CORNER QUESTION.

SIR CHARLES DILKE, having discovered that the present time is hardly propitious for a general reconstruction of the Constitution under the guidance of himself and Mr. Odger, and being encouraged perhaps by a previous success in comic literature, on Tuesday treated the House of Commons to what might have been a very readable article in a magazine. It is often said that nothing gives so much zest to a holiday in the country as a taste for natural history; but Sir Charles, somewhat varying the prescription, seems to have diverted himself during a tour in the South of England by a study of the parasitical corporations which are still to be found in various out-of-the-way parts of England. There can be no doubt that his speech is very amusing to read, though it must have been rather tedious to listen to through several hours, and it may also be thought that it was rather too much in the nature of loose gossip to be worthy of the attention of the House of Commons. The stories which Sir Charles picked up in his rambles are obviously not the sort of evidence on which a serious legislative body can be expected to act; and though he wound up with a modest resolution to the effect that it was "desirable to forthwith abolish all criminal jurisdiction exercised by unreformed municipal corporations or their officers, with the exception of that of the City of London, for which due provision had been made by statute," he went far beyond this in his general statement. Apart from his own investigations, he appears to have trusted very much to "a vast number of letters from the respectable inhabitants" of the unreformed municipalities, and he mentioned as a singular fact that "in every one of these letters the inhabitant who writes it informed him that the unreformed corporation of this particular borough was undoubtedly the least efficient and most corrupt of all." Those, however, who have paid any attention to human nature in its general aspects must have observed that there is a common tendency to be dissatisfied with the local authority, whatever it may be. There are everywhere "respectable inhabitants" who are filled with the most intense distrust and hatred of those who manage their local affairs; and, if Sir C. Dilke had extended his inquiries to the reformed corporations, he would have discovered that there also are many people who think that their particular local authority is the least efficient and most corrupt of all. We do not of course mean to say that there may not be grounds for this belief in the case both of unreformed and reformed corporations; but only that it must be proved by evidence very different from the loose talk of the "man in the street" which Sir C. Dilke has collected, before it can be made the ground of legislative action. In a general way, indeed, we are rather tempted to believe much that is said of the rottenness of corporations which are under no supervision and render no accounts; but then we would give the devil his due, which is a fair trial. In these days, when the Government is so fond of Royal Commissions, the condition of the unreformed corporations may perhaps be an appropriate subject of inquiry, and Sir C. Dilke's speech, though not to be accepted as trustworthy evidence, at least furnishes some reasons for looking into the subject. Almost every part of England is now increasing so much in population and importance that the provision of proper municipal administration is a clear duty of the State; and though some of the tricks which are played may be very funny at a distance, they must be irritating to people on the spot.

Sir C. Dilke's first case is that of Fordwich, in Kent. We may set aside the opinion of an ex-mayor and the rector that the Corporation of Fordwich is the worst on the face of the earth; but it is also stated that it consists of a body of six self-elected persons, only one of whom is resident, and who have the right of adding as a seventh any person who will pay 10*l.* These persons are *ex officio* justices of the peace, and hold sessions at which they try criminal offences, and they also license public-houses. They publish no accounts, but they have lands, tolls, and a trading tax, and levy a rate. Their official meetings are held at a public-house, at which it is said "rowdies collect and drink at the expense of the corporation." The present Mayor has held office for twenty-eight years, and his predecessor ruled for forty-four. The latter is accused of having stolen corporate property, and, as there are no published accounts, any mayor who chooses may pocket what he pleases. In Pevensey there is an elected corporation which also holds lands, levies a rate, keeps no accounts, and dines periodically at the public expense. Again, at Seaford the corporation is alleged to have parted with a long lease for two or three hundred years of valuable property to one of their number for 500*l.*, which they then divided among themselves. There seems to be reason to believe that in many of these cases the proclaimed value of the property held by the corporations is far below the mark; and when any one has other people's property in his hands, and nobody to look after him, it may be safely assumed that, human nature being what it is, he is very likely to put it in his own pocket. Formerly the Corporation of Seaford gave 20*l.* a year for the National schools, but they have withdrawn this subscription, and nobody knows, though any one may guess, where the money now goes to. The

Corporation of Seaford has criminal jurisdiction, and we are told that one of its members has been thrice bankrupt under equivocal circumstances, and has also been fined for a street assault, while another has been seen drunk on the bench, and a case is said to be known which was squared in court for a quart of beer. Several of Sir C. Dilke's assertions in regard to Seaford have, however, been promptly contradicted, and it would be rash to accept his budget of gossip without inquiry. At Yarmouth, in the Isle of Wight, there is, according to the same authority, a large property which is mysteriously sucked up. The returns of property are ridiculously under the value, and the accounts of expenditure command very little confidence. The Corporation of Wareham is a licensing body, and includes three brewers, the result being that it has seven public-houses to every thousand inhabitants, or seven times as many as the ordinary average in England. Corfe Castle is a corporation consisting of a single member, who apparently elected himself—at least there is no trace of any other electors—and though there are, strictly speaking, no revenues, there are large charities and considerable jurisdiction. In this case there was once an application to the Court of Queen's Bench to call upon the Mayor to prove his title, but the Judges held that, as he actually existed, there was a presumption in favour of his right to exist. What will happen if the present Mayor disappears nobody can say. It is fortunate, perhaps, that the lord of the manor, who bears the title of Lord High Admiral of the Isle of Pur and the adjacent seas, and who has power to muster the whole population for military service, is an inoffensive clergyman. The Corporation of Plympton Earle, in Devonshire, some years back bagged a portrait of Sir Joshua Reynolds, painted and presented by himself, and sold it for their own benefit. Saltash, near Plymouth, levies duties on all ships entering the Sound, and is ruled by a close body of self-elected irresponsible shopkeepers, who job the land among themselves, and lately sold the church font. Lostwithiel is also cited as one of the worst places in all England; but the details involve personal charges which it would perhaps be difficult to prove. It is said to be believed in Lostwithiel that the dominant persons let land to themselves at perpetual leases; and if half of what is said is true, the inhabitants are shamefully used. Sir C. Dilke also assailed the Corporation of Henley-upon-Thames, but he admitted that, "in the total absence of evidence, and complete concealment of accounts," it was impossible "to even pretend to say" what they had done with the public money. This indicates the difficulties which would attend any investigation into these matters.

The debate on this subject afforded another illustration of the deplorable weakness of the Government in regard to its legal advisers. Such a low level of professional capacity in this respect was probably never before reached, and the Government is constantly discredited by the scrapes into which it is plunged by the incapacity of its law officers. The exhibition which the Attorney-General made of himself in the Slave Circular debate must deepen the regret that Sir H. Giffard should have again failed to get a seat in Parliament. On Wednesday the Attorney-General once more distinguished himself by his ignorance and want of judgment, and had to be immediately put down by the Home Secretary, who repudiated his obsolete ideas of law, and took up quite the opposite position. It is clear that, whether in the old technical sense the corporations in question are trustees or not, they have no right to appropriate public money to their own uses, and that every town has a right at least to know, if not to control, the expenditure of its funds. We are certainly not of the school which thinks it either desirable or possible to establish an ideal symmetry in every little detail of local government; and, where old customs do no harm, we should gladly see them preserved, if only as historical curiosities. At the same time, the inhabitants of the places in question have a right to proper government, and the criminal jurisdiction of irresponsible and ignorant shopkeepers is clearly an indefensible abuse. We must also say that we cannot see that there is anything picturesque in the miserable jobbery and plunder which are practised by these obscure and useless corporations. What is wanted is not a sweeping removal of old customs, but a judicious amendment of real abuses; and of course it would be necessary in every case to test the truth of the stories which are told. The Home Secretary's promise to take in hand the criminal and licensing jurisdiction of the unreformed corporations is a step in the right direction, and a general Commission might usefully investigate the whole subject.

A LITTLE-KNOWN DUTCH PAINTER.

VISITORS to Burlington House during these last weeks have had their attention so unceasingly called to the glories of English art exhibited there, that many of them may have missed the few feet of wall where gleam, in happy contrast to the sombre magnificence of the great Melozzo da Forlì, a dozen little masterpieces of the colour and brilliancy of Holland. In æsthetic circles in England, at the present time, Dutch art is undoubtedly not in high favour. Dutch pictures, of course, fetch their price in the auction-room, as was proved last year at the sale of the Brolel collection; but that is probably in consequence of foreign competition, and of the love of rich collectors for time-honoured names. But the opinions of "æsthetic circles" are formed by the critics, the English critics of the present generation have been formed by Mr. Ruskin, and Mr. Ruskin's opinions about "the Van-Somethings and the Back-Somethings" are well known. So that there is a real danger lest, in presence of the higher charms of Italian idealism, the charms of Dutch reality should be lost sight of, and *genre* should be voted commonplace, not because it is commonplace, but because it is *genre*. There is a picture among those lent by the Queen to the Royal Academy which in itself is enough to refute the overdone assertions of those who assert that all Dutch art, or all Dutch art except Rembrandt's, is prosaic and soulless. It is a subject that is not uncommon; a girl is playing on the harpsichord while a young man listens. The room is large and the sense of space is heightened by the scantiness of the beautiful furniture; there is little but the polished satin-wood of the instrument and the table with its rich covering. Through an open lattice the light pours in, and rests in bands upon the smooth floor and floods the pale grey wall. These are the elements of the picture, and it is easy to enumerate them; but words can give no notion of the mastery of its treatment, of that "sense of the delicacies of interior tone" which appears in it, as it appears in all the work of this painter and of his two great contemporaries, De Hooghe and Maas. Unfortunately enough, the frame of the picture is labelled with the name of Eglon van der *Neer*. But the preparers of the Academy Catalogue have shown that they knew better than the Directors of the Queen's Galleries, and have changed the name of that Netscher-like painter of satin draperies for that of the real painter of this picture, the rare and precious Jan van der *Meer* of Delft. Ten years ago it would probably have been impossible to make this change; but since then the enthusiastic labours of the Frenchman Thoré, who wrote under the name of Burger, have revealed this great artist to the world. Before that time, to use Burger's words, he had "disappeared behind De Hooghe, just as Hobbema had disappeared behind Ruysdael." Now, thanks to M. Burger, something like seventy of his pictures are known, of which nearly twenty are traceable to a sale at Amsterdam in 1696—the sale either of his own effects or of those of a contemporary admirer. Alas! none of the seventy hangs on the walls of our National Gallery. Sir Charles Eastlake once had the chance of securing one for a nominal price; but he missed it, and no one knows how long it will be before the chance occurs again.

Who was this Jan van der Meer of Delft? Not only is almost nothing known of him, but our ignorance darkens into confusion when we hear that at least three, probably four, other Jan van der Meers occur in the lists of Dutch painters of the seventeenth century. M. Burger, after years of search, ends by crying in despair that he sees a whole phalanx of Van der Meers appearing over the horizon. M. Van der Willigen, in his learned book on the artists of Haarlem, accounts for seven or eight; and with a pardonable excess of patriotism claims for one of his townsmen some of the best landscapes of "le Delftois." But, in spite of the uncertainty of the details, a few central facts are undisputed. It is established that Jan van der Meer, or Vermeer, as he often signed himself, was born at Delft in 1632; that he studied under Rembrandt's distinguished pupil, Carel Fabritius; that, after Fabritius was killed by the explosion of 1654, he almost certainly went to work in Rembrandt's studio at Amsterdam; and that he returned to paint at his native town, where his pictures had great vogue, and sold for extraordinary prices. A garrulous old diarist, one M. de Monconys, who travelled in Holland during the golden age of Dutch art, was surprised by nothing so much as by the prices paid for the work of native artists. "A fainting woman by Mirris (*sic*) for 1,200 livres! Preposterous," he notes in one place. "At *Delphes* I saw the painter Vermeer; and we found one of his pictures in the possession of a baker, who had paid 600 livres for it. It was only a single figure, and I should have thought six pistoles an ample price." Indeed, as Burger remarks, the records of the prices paid in Holland before the infamous invasion of Louis XIV. rival what Manchester pays for David Cox, and Paris for Meissonier, at the present day. It is satisfactory to those who see a difference between genius and mere cleverness, and who know how often the latter outweighs the former in popularity, to find that in their own day the genius of Van der Meer was as much in demand as the cleverness of "Mirris."

There is no better proof of the genuineness and spontaneity of Dutch art than the fact of the number of centres from which all at once it sprang. The schools of Ægina, of Thrace, of Athens; the schools of Siena, of Padua, of Florence, found their humbler Northern counterparts in the schools of Dordrecht, of Leyden, of Haarlem, of Delft, of Amsterdam. To visit the scenes where painters have worked makes one look upon their pictures with new eyes; and this is nowhere truer than with Holland and the Dutch painters. A few weeks spent among the dyke-bound pastures and in the watery cities give a new meaning and a new distinctiveness to the canvases which represent them. Rembrandt becomes intelligible as the painter of a Northern metropolis where wealth and science and serious political activity find their natural home; where Jews and burgomasters, beggars and physicians, goldweighers and triumphant bands of festive archer-guilds, are the common population of the place. Albert Cuyp's broad rivers and deep meadows and sleepy cattle are understood in a moment as one ascends the Maas from Rotterdam to Dort. And even at this distance of time, when Delft has lost all its importance, and even the brightness of its house-fronts; when the place of the great William's murder is shown by apathetic soldiers; when the pottery which has made the name of Delft a household word in Europe has been dispersed till not a crock remains in its native town—even now there is something in Delft which recalls Van der Meer. Its aspect is that of a rich provincial centre, full of a calm

and uneventful life, producing few types of character, and yet nursing a solid intelligence among its children. A superb picture in the Hague Gallery gives the best possible idea both of the town and of the painter. It is a view of Delft where the Rotterdam gate spans one of the smaller canals, while a larger canal flowing from left to right fills the foreground of the picture. Beyond are red houses and red roofs, cool trees and sunny water; the great spire of the new church behind; boats moored to the shore, and soberly-dressed figures near them. Nowhere is the spirit of Holland more fully shown; the exquisitely refined homeliness of Dutch life speaks from this view of a town exterior as plainly as it speaks from the interiors of Terburg, and Van der Meer adds a breadth, a modernness which Terburg never gave.

This "View of Delft," together with a "Street in Delft," in the Six collection in Amsterdam, and possibly one or two landscapes that belonged to M. Suermondt, are about the only specimens of outdoor views that remain to us from Van der Meer's hand. As a rule, he painted domestic scenes, and showed a fondness for single figures; such as the miraculous "Laitière" in the Six collection, the "Girl Reading a Letter"—a faint, almost Whistler-like study of blues and greens and greys—in the Hoop Gallery; here a bride fitting on her necklace; there a young geometer, his hand on his instruments and his eyes steadily fixed on visionary figures in the air. Or, again, he may choose his subjects as Terburg did, and paint a music lesson, as in the picture at Burlington House, or a soldier with a "dame qui rit." But his qualities are independent of his subjects, and are always the same. In technical points, while he never aims at the ivory finish of Terburg or Dow, he has as great a command over his resources as they. To their eye for detail he joins a sense of the mystery of shadow and of the magic of light which we may believe to have fallen like good seed upon his imagination from the teachings of his master Rembrandt. This is what gives to him, to Maas and to De Hooghe, a charm which those other more famous painters are without. So far as they go, no doubt they are absolutely perfect and wonderful; but our wonder at the artist is never in their case mingled with affection for the man. In the case of Van der Meer and De Hooghe, however, affection comes first; they can hardly have helped being men of pure and attractive lives, with their love for happy children and fair mothers, and cool interiors with soft effects of light. They have caught and perpetuated for us the best side of the life of Holland at her happiest moment. What Balzac has said of Flanders is still more true of Holland; her character is summed up in two words, patience and conscience—"patience, the necessary condition of art; conscience, that which alone makes the creations of art durable." "You might think," says Balzac, "that these qualities would exclude the rich *nuances* of poetry, and make the manners of this country as flat as her wide plains, as cold as her misty sky. Not so; civilization has come in to modify everything, even climate. The land which nature had seemed to condemn to dulness and uniformity found in her political relations with the South and East the means of throwing brilliant jets of light across her gloomy atmosphere. From Spain she caught and kept the taste for scarlet, for shining satins, for bold effects of coloured carpets, for feathers and mandolins, for the forms of courtesy. From Venice she took, in exchange for her linens and laces, that fantastic glass which gives to wine a new sparkle and a new flavour. From her commerce with the East she gained the grotesque inventions of China and the marvels of Japan." But, true as this is, it was only after a long and desperate struggle that Holland found herself thus able to absorb the riches of the world. Patience and conscience had brought her by slow and toilsome steps to where she was; had drained her fens, had beaten off her foes, and only then could look for their reward. One short century was allowed to Holland, the century bounded by Philip II. and Louis XIV., and that is the century of Dutch art and Dutch letters, as it is of Dutch prosperity and success. For a moment Holland possessed her soul in patience; she felt herself safe in the hands of Rembrandt's grave Syndics, and of Tromp and Ruyter; she had leisure to look round her and enjoy an exquisite material happiness. It is such a happiness that Van der Meer represents for us, and the very exquisiteness of his eye and touch lends a kind of ideality to it. "Cool places, quiet houses, subdued light, tranquillizing voices"—one is filled with a sense of these as one stands before a picture of his; of these, and with the thought of how lovable Holland must have been in those days, and how much her sons must have loved her.

THE AMERICAN PEDESTRIAN.

THE performances of Mr. Weston, the American pedestrian, have an interest for many persons beyond the ordinary readers of sporting newspapers, and we are glad to observe that the *Lancet* and other medical papers are turning attention to them. It may be useful to note what Mr. Weston has done since he came to London. He undertook to walk 115 miles in twenty-four consecutive hours, and he invited W. Perkins, the English champion at fast walking, to join the performance, with the understanding that the one who walked the greater number of miles in that time should receive a silver cup. Although Perkins had recently performed the remarkable exploit of walking 8 miles in 59 mins. 5 secs., his powers at a long journey had not been adequately tested; but nevertheless the challenge was accepted on his behalf. The Agricultural Hall, Islington, was chosen as the scene of operations, and the difficulty arising from the obligation to close the Hall at 12 P.M. was surmounted by application to the police, who gave leave to continue the match during the night in presence of officials and members of the press. It is not wonderful that the accounts published of Mr. Weston's performances by American newspapers have been received in this country with hesitation or even incredulity, because it is difficult to feel sure that times and distances have been accurately taken. But after what has been lately seen it may be readily believed that Mr. Weston walked in 1867 from Portland, Maine, to Chicago, a distance of 1,326 miles, in rather less than twenty-five days. The undertaking was to walk this distance within thirty consecutive days without walking on Sundays, and Mr. Weston not only rested on Sundays, but for an entire day besides. This performance made Mr. Weston famous as a pedestrian, and many others followed. One of his latest in America was a walk of 500 miles at Newark, N.J., in rather less than six days.

The match between Weston and Perkins took place on the 8th and 9th of February. The start was made at 9.25 P.M., and at 11.41 A.M. Perkins gave up, having walked rather more than 65 miles. It is only fair to quote his statement that he never attempted a long-distance match before, the furthest he ever walked being 8 miles. Weston, when Perkins retired, had nearly completed his 71st mile, and within twenty-four hours he walked 109½ miles. After he has actually done this under our view, the boast of the gentleman in search of employment, that he would walk from Chicago to St. Louis in some very short time, "if the track did not give out," ceases to appear extravagant. Except a trifling blister Weston's feet were uninjured, while "the swollen and bleeding condition" of Perkins's feet and his manifest nervous exhaustion were attested by a medical certificate. Another match was made between Weston and a man named Clark, who must have been almost unprepared, and the start for this match was made at 9.45 P.M. on 15th February. Both men walked on artificial tracks of loam and gravel laid down in the Agricultural Hall. In the former match Weston walked on a similar track, but Perkins walked on the boards. Clark resigned the contest at 9.35 A.M., having completed 55 miles. Weston went on alone, did 100 miles and a fraction in twenty-four hours, played "God save the Queen" on a cornet when he had done 126 miles, and, having completed 180 miles in forty-eight hours, stopped. It is said that Clark's feet were blistered, not badly enough to prevent him from walking, but certainly to prevent him from winning. Last week Weston made another match, the time being increased to seventy-five hours, and his opponent, Rowell of Cambridge, having 50 miles start. The result of this match was that Weston walked 275 miles within the appointed time, and Rowell 175 miles, so that the latter did not nearly win even with the start he had. "The American addressed the audience at the termination" after the manner of his countrymen. The only difficulty about making any more matches seems to be that there can be no opponents except time, who is but dull company. A band of music did its best to keep up Weston's spirits, and the spectators, we may be sure, made all the noise they could.

There are not, so far as we know, any special reasons for expecting this kind of endurance in an American. Formerly settlers in what were then the Western States were necessarily great pedestrians, as is shown by the current saying that if you had time for your journey you might ride your horse, but if you were in a hurry you had better walk. But in America, as with us, the necessity for long walks has almost disappeared. The brigade of Guards made formerly countless marches between London and Portsmouth, but now they would go by rail. Sir George L'Estrange, in his *Recollections*, published not long since, gives a portrait of himself as an ensign of the 31st Regiment, playing the flute on horseback, to coax a lot of wild Irish recruits along the road from Portsmouth to Ashford. Formerly a sailor, shipped perhaps at Sunderland, might be wrecked, or otherwise get ashore at Falmouth, and there would be nothing for it but to walk home, begging as he went. Under these circumstances a man had every inducement to keep going, and distances have been done in times that would now be thought remarkable. A more celebrated instance is that of the Dutch Admiral, De Ruyter, who, as a boy, was shipwrecked on the coast of Spain, and walked back to Holland. Forty or more years ago, Mr. Cochrane started from Paris, intending to walk to Siberia, and we believe he got as far as Moscow, and perhaps he went further. There must have been many soldiers of Marlborough's time who had walked every step of the way from Ostend to Blenheim on the Danube and back, and if we may suppose that shoes were not then so good as they have since become, it follows that feet must have been far better. Jeanie Deans's walk from Edinburgh to London, with the various lifts she got on the way, is one of those passages of fiction that are much like truth, and she, like the sailors of whom we have spoken, would probably prefer to walk barefooted. The fact that in England in the last century there were almost no hard roads was not unfavourable to pedestrianism, and as a good walker could travel as fast as any cheap conveyance, the habit of walking must have been largely developed. Students usually walked to Oxford and Cambridge to keep their terms, and there is mention in the Life of Bishop Jewel of a staff which was his favourite companion in these journeys. All this, however, belongs to a bygone world, and we might have thought that the change of habit, which has been great among ourselves, would be even greater in America. When roads were better horse expresses came into fashion, and men lived eighty years or more ago who could ride from Liverpool to London; but now such a ride would

be thought as extraordinary as one of Mr. Weston's walks. It is all a question of habit, and particularly of leather.

There is of course a wide difference between walking on a prepared track at the Agricultural Hall, with reclinings, rubbings down, cups of tea, slices of lemon, lumps of ice, a brass band, and 5,000 spectators, and any performance which may be called natural. But unless a match is walked under perpetual supervision there is risk, we will not say of unfairness, but of the suspicion of it. Lately we observed that all the resources of the Government of the United States did not avail to get the distance exactly measured between Cheyenne and an Indian station to which stores had been conveyed under contract; and, therefore, we might suspect that, for adequate consideration, uncertainty might be introduced into other measurements. There are numerous trials of horses recorded in various times and countries which we regard as practically worthless, for want of that businesslike accuracy of observation which has now become habitual with the reporters of our sporting journals. After all that Mr. Weston has done here, his time and distance from Portland to Chicago may be taken as accurate; and it appears, therefore, that during twenty-five out of thirty consecutive days he walked on the average 53 miles a day, or for about thirteen hours daily at the rate of four miles an hour. If this performance is compared with those of our best vacation tourists, it will probably appear that they fall far behind the American in continuity of work. The most energetic mountaineers like to have their "off days," and such an undertaking as a walk from Portland to Chicago, besides other difficulties, might seem insupportably dull. It may be said, on the other side, that if a man once got his feet hard, and fell into the habit of walking 50 miles a day, it would be as easy to go on as to leave off, or easier, and there is some truth in this. It may be added that, in the last century, people did not mind being dull. When they were not in motion they would go contentedly to sleep. As things are, however, we should doubt whether a suitable opponent for Weston will easily be found. He must be almost exclusively in possession of the habit of these two or three days' continuous walks. Before the days of telegraphs, it used to be said that despatches for the Turkish or Russian Governments were sent by man and horses, and the rider was always the same, but the cattle were changed frequently; and the men who did this work showed the same kind of endurance as Mr. Weston. On looking over the time-table of his second match, published in *Bell's Life*, we are perhaps more impressed with his endurance than by any general description. The time for every mile is given from 9.45 P.M. on Tuesday, 15th February, to the same hour on Thursday. Many miles were done in slightly under or over thirteen minutes, and in only fourteen instances do we find any number of minutes exceeding nineteen recorded. Thus, it may be said that he only rested fourteen times; and, further, he never rested more than forty minutes at once.

A body of literature already exists on the subject of pedestrianism, and it will be doubtless augmented by descriptions of Mr. Weston's boots or shoes, socks, and other equipments. After all, however, as has been said regarding arms and armour, the principal point is what kind of man there is inside them. Judicious and continued training will do much, as was shown by the march of the British Light Division to Talavera in 1809, when it did 62 miles in twenty-six hours of the hottest weather of the year, leaving only seventeen stragglers behind. This would not be wonderful as an individual performance, but we doubt whether, with the best training, a body of modern troops could do as much, and yet the boots are better and the men as good as they were then. But national habit has greatly changed. It must be remembered that on a campaign the pedestrian has only one pair of feet and also frequently only one pair of boots. The actual condition of things is vividly represented by Sir George L'Estrange, when he tells how Sir John Byng, commanding a division, lent him a pair of shoes, and said that he should not be above taking them back when the subaltern's own kit came up. There is a practical air about directions for the care of feet and boots by men who have walked for weeks under the consciousness of having only one pair of each, and therefore one is inclined to heed such advice as that of Colonel Shaw, who, as the result of his own experience in Spain and Portugal, assures us that there is nothing like soft-soap, advising the campaigner to eat as much meat and drink as little as possible. It may be doubted whether science or practice has got much beyond soft-soap since he wrote. Mr. Weston, be it observed, has already walked three good men off their legs, and we are not so much surprised at their failure as at his success. It would be interesting to know more as to his "pedigree," if we may so say, and his early training.

REVIEWS.

LIFE OF LORD PALMERSTON.*

MR. ASHLEY'S continuation of Lord Dalling's Memoir of Lord Palmerston is in all respects superior to the earlier work. Lord Dalling's materials illustrated almost exclusively the diplomatic transactions in which he had himself been employed. Mr. Ashley's account of the later part of Lord Palmerston's career is continuous, although it is for the present incomplete and even fragmentary, perhaps in consequence of the necessity of maintaining proper personal and official reserve. As Lord Shaftesbury says in an interesting letter on Lord Palmerston's character, many of his contemporaries are still alive, and the Sovereign whom he served is still on the throne. Mr. Ashley may perhaps at some distant time explain in a fuller biography the relations of Lord Palmerston with the Crown, with his colleagues, and with his political contemporaries. The greater part of the present publication consists of Lord Palmerston's letters, which are in the highest degree characteristic. His written style was as frank, as lively, and as free from conventional stiffness as the conversational manner which pleased the House of Commons better than rhetorical declamation. Mr. Ashley shows himself a skilful and judicious editor, though he might perhaps sometimes have with advantage made his connecting narrative fuller. His concluding summary of Lord Palmerston's character and the occasional anecdotes which he introduces display literary ability and good taste. The personal intimacy which arose in the first instance from family connexion, and the official relation which he bore to Lord Palmerston as Private Secretary, have furnished Mr. Ashley with abundant opportunities which he is fortunately capable of using. A wide difference of years probably renders him more competent than a more equal contemporary would have been to make Lord Palmerston's character intelligible to the present generation. No statesman, indeed, was more free from mystery or from complexity of nature; but the circumstances in which Lord Palmerston's activity was exerted have during the short interval since his death become partially obsolete. His most eminent successor had been, even when both were members of the same Cabinet, utterly opposed to him in policy and temper; and Lord Palmerston had in his later years, though he was at the head of the Government, been compelled to modify the system on which he had acted during his long incumbency of the Foreign Office. Mr. Ashley says that

> the years of his last administration of the Foreign Office have this peculiar feature about them, that they form the last period of active intervention by England in the affairs of foreign countries. We appear to be removed from that epoch by a wide interval. It seems difficult for us now to imagine the despatch of a British legion to assist a sovereign against a portion of his subjects, to realize a Quadruple Alliance in which England should join to secure the succession to a Continental throne, or even to believe in the advance of a British fleet to protect a weak neighbour from wrong.

The Spanish Legion and the Quadruple Alliance are precedents which may be departed from with little regret. It is not strictly accurate to date the period of non-intervention from Lord Palmerston's dismissal in 1851, since the Crimean War, which was perhaps an indirect consequence of his retirement, began two years later; but in spirit and substance Mr. Ashley is in the right. During more than twenty years Lord Palmerston, by a vigorous policy and a demeanour which sometimes bordered on menace, preserved uninterrupted peace. The ostentatious timidity of Lord Aberdeen immediately resulted in the Crimean War. A similar tone and tendency at a later period were rewarded by the humiliating payment of the *Alabama* penalty and by the Russian repudiation of the Treaty of Paris. The correspondence furnishes additional and superfluous proof of Mr. Gladstone's strange mistake in asserting that Lord Palmerston had anticipated the brief duration of the treaty; but the change in English policy is not altogether due to the degeneracy of Lord Palmerston's successors. The vast increase of modern Continental armaments has rendered England relatively weaker, except for defensive purposes; and, as Mr. Ashley justly remarks, the extension of popular power and the diffusion of a superficial knowledge of public affairs deprive Foreign Ministers of the independence which Lord Palmerston enjoyed and practised during his tenure of office.

It is a relief at the beginning of Mr. Ashley's work to find that there is nothing more to be said on the tedious subject of the Spanish Marriages. The following years were occupied with the agitation which found vent in the revolutionary outbreak of 1848. In the meantime Lord Palmerston had encouraged the Confederate Government of Switzerland to crush the Sonderbund, in defiance of the remonstrances of Austria and France, and he had despatched Lord Minto on the Italian mission which was at the time misinterpreted both by Italian patriots and by reactionary Governments. Lord Palmerston's instructions and the efforts of the Envoy were directed, not to the promotion of popular disturbance, but to the chimerical object of confirming the Pope in the Liberal tendencies which he professed, and of warning the Princes of the danger of resisting the just aspirations of their subjects. The denunciation of mixed education in Ireland by the Roman Catholic prelates, at the instigation of the Holy See, disabused Lord Palmerston of any reliance which he might have placed in the moderation of Pius IX. It is to be hoped that Lord Minto communicated to the Pope a letter in which Lord Palmerston authorized him to assure the Papal authorities

> that at present, in Ireland, misconduct is the rule, and good conduct the exception, in the Catholic priests. That they in a multitude of cases are the open, fearless, and shameless instigators to disorder, violence, and murder, and that every day and every week, the better conducted, who are by constitution of human nature the most quiet and timid, are being scared by their fellow-priests, as well as by their flocks, from a perseverance in any efforts to give good counsel and to restrain violence and crime.

If Lord Palmerston supposed that remonstrances on merely moral obliquities, such as a propensity to murder, were likely to find sympathy

* *The Life of Henry John, Viscount Palmerston, 1846-1865, with Selections from his Speeches and Correspondence.* By the Hon. Evelyn Ashley, M.P. 2 vols. London: Richard Bentley & Son. 1876.

at the Vatican, he exhibited an ignorance of Papal nature which was perhaps more excusable thirty years ago than it would be at present. It cannot be denied that the mission of Lord Minto was a failure, though it was not necessarily a mistake. The Austrian Government, both before and after the events of 1848, regarded Lord Palmerston as an enemy, because he deprecated the support of despotism in Italy by Austrian arms. M. Guizot, down to the moment of his fall, encouraged Metternich in his reactionary policy; but only a few days before the Revolution of February Lord Palmerston urged the English Ambassador at Vienna to impress on the Austrian Chancellor the danger of provoking a war in which England and Austria would not be on the same side. "In that war, whatever Louis Philippe and Guizot may promise, the principal champions contending against one another would be Austria and France." The Italian revolution preceded by a short time the insurrection in Paris, and, while Charles Albert prepared for the invasion of Lombardy, the King of Naples and other Italian despots hastily promised a constitution. Lord Palmerston consistently advised concession to the reasonable demands of their subjects, though he probably foresaw that cowardice would on due occasion be supplanted by perfidy. On the fall of Louis Philippe he instructed Lord Normanby to maintain friendly, though unofficial, relations with the Provisional Government, and to make the new rulers understand that they must respect the independence of Belgium. Soon afterwards his firm language had the effect of checking Lamartine's impertinent expressions of sympathy with Irish sedition, and it gradually appeared that the Revolution had rather diminished than increased the risks of misunderstanding between England and France. The agitators who overthrew Louis Philippe had clamoured for war with England chiefly for the purpose of damaging the Government. Having attained their object, and having succeeded to the responsibilities of power, they had no longer a motive for affecting hostility. If Louis Philippe and his Minister disliked Lord Palmerston, their antipathy was fully returned. In one of his letters he expresses an unfounded belief that Louis Philippe had paid the expenses of a couple of charlatans who were returned to Parliament for the purpose of accusing Lord Palmerston of being in the pay of Russia. One of his assailants was soon prudently bought off, while the other, who was probably incorruptible, subsided into utter insignificance.

The account of the unexpected dismissal of Lord Palmerston from office in 1851 is full and interesting, though Mr. Ashley has, probably through consideration for Lord Russell, abstained from notice of one of the oddest circumstances in the transaction. At the close of the Session of 1850 Lord Palmerston had achieved his greatest Parliamentary triumph. In consequence of a censure on his conduct in the affair of Pacifico which had been carried in the House of Lords, Mr. Roebuck moved in the House of Commons a vote of approval of the foreign policy of the Government. The blockade of the Piræus and the seizure of a certain number of Greek vessels had at first been generally disapproved, under the popular impression that Lord Palmerston's vigorous action had been exercised against a weak and helpless adversary. His vindication of the justice of the proceeding perhaps produced less effect than the incidental disclosure of the firmness with which he had baffled the intrigues and defied the threats of Russia and France. In a speech of four hours, delivered with untiring energy, he defended his policy in all parts of the world; and the announcement of a majority of between forty and fifty on the division was received with enthusiasm by his party. It was on this occasion that Sir Robert Peel, two or three days before his death, said in an adverse speech, "We are all proud of him"; and Lord John Russell, in winding up the debate, declared, amid the cheers of his followers, that Lord Palmerston was "not the Minister of France, of Austria, or Russia, but the Minister of England." It could hardly have been supposed that within six weeks the Prime Minister who had eagerly sought a share in the popularity of his colleague should convey to him a severe and unprecedented rebuke for the very policy which had been, at the instance of, Lord John Russell, sanctioned by the House of Commons. The debate on the Greek blockade ended in the last days of June; and in August, as soon as the Session was over, Lord John Russell forwarded to Lord Palmerston a Memorandum from the Queen to the effect that the Foreign Minister was in future to lay all important despatches before Her Majesty on pain of dismissal. There could be no doubt that the Queen, or rather the Prince Consort, intended to censure Lord Palmerston's conduct in the Pacifico affair; and Lord John Russell, by transmitting the communication, adopted as his own a reproof of the policy which he had recently defended in the House of Commons. When the document was, after an interval of a year and a half, made public, much surprise was felt at the submission of a proud and self-confident Minister to the disapproval of his conduct by the Queen and by his own principal colleague. His apology was to the effect that his resignation in August 1850 would have raised an issue between himself and the Crown, that a decision against himself would have been fatal to his future career, and that he considered it his duty in all circumstances to abstain from impairing the Royal authority. From that time he must have been conscious that he was regarded with jealousy by Lord John Russell, but he seems not to have appreciated the insecurity of his position. The Session of 1851 was chiefly occupied with debates on the absurd Ecclesiastical Titles Bill; and the Hyde Park Exhibition attracted more general interest than any political question. In the autumn of the same year the struggle between the French President and the Assembly was approaching a crisis; and Lord Palmerston from the first anticipated and desired the success of Louis Napoleon. His policy was not heartily adopted by his representative at Paris, the weak and incapable Lord Normanby. The Ambassador was influenced by personal intimacy with the Burgraves, as they were nicknamed—Thiers, Odilon Barrot, and Tocqueville—and he entertained constitutional scruples which Lord Palmerston thought inapplicable to the newly-manufactured Republic of France:—

> As to respect to the law and Constitution [he wrote to Lord Normanby], which you say in your despatch of yesterday is habitual to Englishmen, that respect belongs to just and equitable laws framed under a Constitution founded on reason, and consecrated by its antiquity, and by the memory of the long years of happiness which the nation has enjoyed under it; but it is scarcely a proper application of those feelings to require them to be directed to the day-before-yesterday tomfoolery which the scatterbrained heads of Marrast and Tocqueville invented for the torment and perplexity of the French nation: and I must say that that condition was more honoured in the breach than the observance.

When Louis Napoleon closed the Assembly by force, Lord Palmerston intimated orally to the French Ambassador, Count Walewski, his satisfaction with the result of the struggle; and his communication was, as might have been expected, transmitted to Paris with some exaggeration of its tone. Lord Normanby, who received instructions to make no change in his relations with the French Government, was surprised and offended on hearing from M. Turgot of Lord Palmerston's conversation with Count Walewski. Lord John Russell immediately called Lord Palmerston to account; and, after receiving his explanation, he peremptorily announced his dismissal. It was during the subsequent explanations at the beginning of the Session of 1852 that Lord John Russell read to the House of Commons the Queen's Memorandum of August 1850. Although Lord Palmerston had been the most popular, and incomparably the ablest, member of the Government, those who disapproved of the late Revolution in France were at first disposed to justify the decision of the Prime Minister; but Lord Palmerston informed the House that Lord John Russell had himself expressed to Count Walewski in stronger language his own approval of the act of the President. Lord John Russell had not been aware that his conversation had been repeated to Lord Palmerston, and in his opening speech he had not thought fit to communicate to the House either his opinions on French affairs or the fact that they had been transmitted to the French Government. Lord Palmerston had perhaps not sufficient proof of the existence of a foreign intrigue to which he attributed his expulsion from office; but the impression which was produced abroad furnished the strongest testimony to his influence on the politics of Europe. Every Liberal on the Continent regretted a change which delighted the partisans of absolutism. Mr. Ashley quotes the well-known German couplet in which it is recorded that,

> If the Devil has a son,
> Then be sure it's Palmerston.

Mr. Lear, in one of his pleasant books of illustrated travel, tells a story of his own arrest in a remote town of Southern Italy by a drunken policeman, who mistook the signature of his passport for the name of the bearer. The officer dragged the suspicious stranger along the village street with an exulting shout of "Ho preso Palmerstoni." Prince Schwarzenberg, then all-powerful in Austria, had the bad taste to give a ball expressly in celebration of the supposed disgrace of his English opponent. Like Prince Bismarck, to whom in other respects he bore little resemblance, Lord Palmerston acquired by habitual plainness of speech credit for deep and dangerous designs.

The indulgence of a petty feeling of jealousy had the result of transferring, during the remainder of their joint lives, the first place in the Liberal party from Lord John Russell to his fortunate victim. Within a month Lord Palmerston drove the Ministry from office by an Amendment in favour of a serviceable Militia on a Bill for constituting a merely local force; and on the fall of Lord Derby's short-lived Government Lord John Russell found that he would not again be accepted as Prime Minister. In Lord Aberdeen's Government Lord Palmerston was with difficulty persuaded to serve as Home Secretary; but he liked the office, and he displayed in the discharge of his duties characteristic ability and vigour. The policy which he recommended at the beginning of the dispute with Russia was overruled by the timid Prime Minister; but Lord Palmerston, as the present publication for the first time proves, was the original author of the expedition to the Crimea. At the close of the first year of the war Lord John Russell again threw over his colleagues, with the immediate consequence of making Lord Palmerston Prime Minister. Sir James Graham, Mr. Gladstone, and Mr. Sidney Herbert at first consented, at the urgent request of Lord Aberdeen and the Duke of Newcastle, to remain in office; but they soon found a pretext for secession, and Mr. Gladstone from that time became the most bitter opponent of the Government. On the Chinese question, and afterwards with better success in the matter of the French Colonels and the Conspiracy Bill, Lord John Russell, Mr. Gladstone, Mr. Disraeli, Mr. Cobden, and Mr. Bright coalesced to drive Lord Palmerston from office. Lord Derby's second Administration occupied the interval while the Liberal party was engaged in healing its internal divisions. Lord Palmerston and Lord John Russell agreed that either would acquiesce in the election of the other as Prime Minister; and Lord Palmerston, having been fortunately preferred, succeeded in persuading Mr. Gladstone not to complete the alliance which he had all but formed with Lord Derby and the Conservative party. From that time to the end of Lord Palmerston's life it is due to

Lord Russell to say that he gave cordial and loyal assistance to his ancient colleague and former rival. Taught by troublesome experience, Lord Palmerston had evidently resolved that, as long as he was himself Minister, Mr. Gladstone should not again be in Opposition. A chronic antagonism of character and principle was judiciously concealed by management, by patience, and by occasional concession. Trusted by Parliament, universally popular in the country, and powerful on the strength of his well earned reputation, Lord Palmerston, after a six years' term of office, died Prime Minister, at the age of eighty-one, retaining his faculties, and even his bodily strength, almost to the last. In a brief space it has only been possible to refer to a few passages in his long career, but all who take an interest in recent history and in political biography will derive pleasure and profit from the study of Mr. Ashley's interesting book.

THE INDIAN ALPS.*

IT is scarcely accurate to say, as the "Lady Pioneer" does in her title-page, that she has given us a narrative of two years' residence in the Eastern Himalayas, and of two months in the interior. At any rate, the allotment of space to these divisions of time is extremely unequal. The book consists of more than six hundred pages; but at least five-sixths are taken up with the trip into the interior, while the first hundred pages comprise the journey from Calcutta by rail to Sahibgunge, the tedious crossing of the Ganges, and the hot stages across the plain of Purneah through the Terai, to the hill-station of Darjeeling. A more correct description of the work is, we readily admit, to be found in the preface, which shows that the writer sent home long accounts of her adventures in search of the picturesque amidst snows and passes, and then expanded them into this goodly volume on her return to England. We infer, from certain allusions, that she is the wife of one of the Government chaplains on the Bengal establishment; and that, when her husband had the luck to be offered an appointment the hill for two years, the usual limit for those happy lands, it was thought expedient to lose a fine chance of crossing the Great Rangjeet river exploring Sikkim, and getting as near to Kunchinjinga or other monarchs of the mountains as the nature of things would allow. The fault of the work is its diffuseness. Its merits, however, are not inconsiderable. The writer's observation is penetrating and quick. The descriptions are lively, and they are set off by a quantity of vignettes, ten large coloured illustrations, and a map. No pencil, not even Turner's, and no pen, not even Mr. Ruskin's, could reproduce exactly the magic effects of sunrise on the Himalayan snows, or the masses of the tropical storm clouds as they appear sometimes to gather round the peaks and sometimes to surge from the plains. But we are bound to say that several of the drawings go a good way to make the reader comprehend the vast heights of the Himalayan summits and their appearance by moonlight, while the sketches of Bhootia and Lepcha women, coolies, ponies, isolated rocks, and swinging bridges are decidedly happy. Nor has the ground been preoccupied by too many writers. Others have told us of Simla, Chini, Spiti, and Kashmir. Darjeeling, though well known to residents in Calcutta and all Lower Bengal, has never been a political centre of attraction. No Viceroy, as far as we know, has ever visited it. Lady Canning went there on a visit in the autumn of 1861, and her untimely death was owing to the seeds of a malarious fever contracted either while she was sketching in one of the valleys of the Ranjit or as she crossed that belt of jungle at the foot of the hills which, in Oriental parlance, is known as the Terai. In fact, difficulty of access and excessive rainfall have hitherto prevented Darjeeling from renovating the jaded frame and the exhausted energies of many a civilized "working-man." The Lieutenant-Governors of Bengal may spend a month or six weeks there, but barristers, civilians, merchants, and all who get leave, generally find it more feasible to run up to the more remote Simla or Mussoori. The question is one not of distance, but of time and convenience. From Calcutta to Umballa there is a railroad for 1,150 miles; forty miles of carriage road take the traveller to the first slope of the hills, and forty more, over ranges of 6,000 feet varied by descents to the beds of torrents, land him at Simla. Rather more than two hundred miles of railway separate Calcutta from Sahibgunge on the way to Darjeeling. But thence the journey resembles an excursion in England before the era of Macadam. There is first the Ganges to be crossed by a small steamer, and in the dry season this process may take up half a day. And next begins a crawl of some forty-eight hours over a road recently constructed, and across rivers and streams not yet spanned by bridges. Above all, there is the dreaded Terai, from which the journey to Simla is free. The difficulty of access is a matter which the new Darjeeling railway will speedily cure. But the excess of rainfall must defy the efforts of administrators and engineers. Instead of seventy-five inches, as at Simla, the invalid must be prepared for about a hundred and fifty at Darjeeling; and for a rainy season, which, instead of being compressed into three, may expand into five months of the year. On the other hand, the view of the snowy range from Jelia Pahar, and the heights around and above Darjeeling, is probably unrivalled in the whole world. Simla has nothing like it. And the lower slopes and ranges have been found profitable for the cultivation of tea. The history of Darjeeling is only briefly referred to in this work, and it is so little known comparatively in England that a few words may not be out of place regarding the sanatorium of one of our oldest provinces.

The territory once belonged to the Raja of Sikkim, with whom we were first brought into contact after the Nepaulese war, in 1815. It was our object to prevent this small principality from being swallowed up or annexed by the Goorkhas, and, in the course of the usual disputes and countercharges on the subject, the advantages of Darjeeling were brought to the notice of Lord William Bentinck by a certain Captain Lloyd, and by an ancient civil servant who held the now abolished post of Commercial Resident at Malda. The Raja, whose revenue was paid in kind from an area of some 1,550 square miles, by a population then numbering about 7,000 souls, was only too happy to cede us a small parcel of territory for a sum of 600*l.* in cash a year; the Governor-General, as the Treaty of Cession aptly puts it, "having expressed his desire for the possession of the Hill, on account of its cool climate, for the purpose of enabling the servants of Government suffering from sickness to avail themselves of its advantages." We are sorry to record that the perverseness of the Raja of Sikkim has cost us two petty wars; one in 1849, and the other in 1860. He had an obstinate and wrong-headed Dewan, whose talents were devoted to kidnapping our subjects, vexing and harassing all kinds of "interests," maintaining slavery, and preventing the resort of settlers to our ceded territories. Those campaigns, which must not be confounded with the Bhootan campaign of 1863-4—to which, however, they bear a strong family likeness—ended, of course, in the discomfiture of the Raja and the banishment of his evil counsellor. The ruler had to put up with the loss of more territory; his allowances were stopped; he was compelled to send an agent to reside at Darjeeling, and he bound himself to discourage slavery and kidnapping, and to permit our officers to visit and survey the country in the interests of commerce and science. Since that period tea has flourished to a considerable extent near Darjeeling: scientific and accurate data have been procured for our trigonometrical surveys; and it is now shown that a lady can traverse the country without involving us in a war of retribution, or encountering any sufferings more grievous than those caused by exposure, want of provisions, or incompetence on the part of her native guides.

The author and her husband were joined in this expedition by a gentleman who figures as "C." in the narrative, but whom, from his title as the *burra Sahib*, and the respect paid to him, we take to be the Superintendent of Darjeeling himself. The gentlemen rode on ponies as far as these animals would go. The lady was carried in what is called a *dandy*, correctly described as "a kind of reclining chair of cane, suspended by leather straps to a strong rim of wood the shape of a boat, with a pole at each end." They had some half-dozen servants, and thirty-two coolies or porters for the baggage, supplies, and tents. Sometimes they lodged in a hut extemporized out of bamboo poles and leafy boughs. One inconvenience of this resting-place was that sundry half-tame buffaloes took a fancy to the leaves, and threatened to eat up the abode during the night. At first considerable annoyance was felt from mosquitoes and insects, but these disappeared as the travellers got to higher levels, and as the chestnut took the place of the plaintain, and, higher up, rocks, *névé*, and ice displaced even the pine. The author makes light of the difficulties and inconveniences felt in the earlier part of the route; but when they had to get rid of their ponies and to diminish the number of their attendants, the whole party were exposed to a series of trials which might have furnished no matter for jocular writing. We make out from the map that, after a short excursion into Bhootan, the author and her companions retraced their steps, and followed the Singaleela range of hills, attaining sometimes to an altitude of more than 12,000 feet. From this they had intended to cross to a place called Yangpoong, which lay to the right of their course. But, owing either to the jealousy of the native chief or to the incompetency and faithlessness of the guide, or to all three united, they failed in this object altogether. Instead of finding themselves in a nice oasis of green pastures, they went on falling into ice-holes, chilled with the mist, and exhausted by the rarefaction of the air, until, with sinking hearts and diminished supplies, they found themselves miles away from their point, ascending a field of perpetual snow, at an elevation of 17,000 feet, just under a huge and forbidding giant known as Junnoo. It was very soon evident that to toil on with Asiatics, the best of whom, at a pinch, was below the standard of pluck displayed by the youngest inmate of the *Goliath*, a bewildered guide, and an empty larder, was a hopeless task, and one which might have resulted in a terrible calamity. And we give the writer all the credit for jumping, with womanly quickness, at the conclusion that the only thing to be done was to "return at once." And so they did. Their hardships in the retreat, the cold and wretchedness, the sinking from delayed hopes down to the depth of despair, the shifts to which they were driven, the doles of rum and brandy and dry biscuits served out to the fainting coolies who lay down by the side of the path, and the quiet determination of the three white faces, are all effectively told. It is clear to us that the preparations for such a trip were insufficient. Tins of meat and biscuits, and rice and pulse, ought to have been provided on a more ample scale; and in a country where Dawk bungalows—*i.e.* Government rest-houses—do not exist, stores

* *The Indian Alps and how we crossed them; being a Narrative of Two Years' Residence in the Eastern Himalaya, and Two Months' Tour into the Interior.* By a Lady Pioneer. Illustrated by herself. London: Longmans, Green, & Co. 1876.

of provisions ought to have been sent on and deposited at intervals. It was obviously unwise to trust so much to a native potentate, who, like all others of his class and politics, saw no good in the invasion of these irrepressible Englishmen who never can enter a bazaar without asking tiresome questions about the exchange of local commodities, and never can get a fine view of plains or rivers without transferring them to paper for some unknown but diabolical purpose. However, the adventurers did return in safety, and they paid a visit to the Buddhist monks at Pemionchi, not very far from the junction of the Ratong and Ringbi rivers with the Great Ranjeet, which visit gives occasion to an interesting description of the lives, devotions, and litanies of these Oriental celibates. The measured and harmonious chanting of the Lamas might move many an English churchman to envy. We congratulate this lady, who can describe hills as well as climb them, that an expedition in which the forethought was not equal to the conception should not have resulted in anything more serious than a chilblain, some cracked lips, a touch of fever, and a broken shin or two.

A few criticisms are, however, indispensable. Urdu phrases, as might be expected, are scattered about the book, but are by no means of equal merit or accuracy. One sentence put into the mouth of a certain functionary named the Tendook, about a perishable body and an immortal soul, is so neat and epigrammatic that it might find a place in one of the sermons of the Rev. Mr. ———, if he ever preaches to a native audience. Other little expressions are not up to the average of ordinary Anglo-Indian talk. The word for the walls of a tent is *kanát*, and not *kernaught*, which is neither Arabic nor English. And where the writer intended to say "kuch neh," or "nothing," she says "khoosh nae," which is decidedly "unpleasant" or "displeased." Then we are treated to sundry little connubial episodes about F. and his trombone, *i.e.* his snoring at nights, which might as well have been omitted, even if duly chronicled in the homeward budget of household details. Some illustrations of native ways and characters are, however, introduced with very good effect; and we are glad to make the acquaintance of a stout fellow named Goboon, who, oddly enough, reminded the author of David going out against Goliath, though his only adversaries appear to have been Philistines in the shape of bears that kept out of sight: of a woman named Funchyng, and of a giant nicknamed Hathi, or Elephant: and of Lattoo, a pretty Bhootia girl, aged nineteen, whose death, from what reads like consumption, forms a pathetic ending to the volume. We hear something also of Soubas and Kazees, and other potentates of Sikkim, and there is a fat Bengali Baboo, who was only too glad to turn back when travelling became a serious matter. The mention of this particular class introduces a begging-letter, which is meant to show how Oriental thought expresses itself in an English compound of slangy expressions and stilted phrases. All we can say is that, if the letter be the genuine production of a half-educated Hindu, the signature of Ram Ghose Mukarji cannot possibly be genuine. No Bengali can be both *Ghose* and *Mukarji*. The former designates one of the three highest houses of the Kayast or writer caste. Mukarji is one of the five *Kulin*, or first-class Brahmins of Bengal. And though we know that an Englishman can represent four dukedoms, or be both a peer and a baronet, no power, divine or human, can make a Hindu partake of two castes. There are some other mistakes which might have been avoided. One of the most celebrated of Raffaelle's pictures is usually known as the *Madonna della Sedia*, or *Della Seggiola*, and not *Madonna di Sedile*. The French phrase "pour combler de misère" has surely one unnecessary letter in the second word. It is curious, too, to trace the imitation of Dickens's style, and of his well-known trick of endowing inanimate things with life. The following must have been inspired by the *Chimes*, or the *Cricket on the Hearth*:—"The wind, increasing each moment, no longer blew, but cut one like knives, and gave one slaps in the face and boxes on the ear, hitting out hard and straight, as though it meant it. It hissed savagely and howled dismally," and "scoured round the coolies in glee," and so on. We are sorry to notice one other passage, which we trust may either only indicate a momentary fit of temper on the part of "F.," or else be one of those lively sallies which Dr. Johnson every now and then reprehended in Mrs. Thrale. A *Padre Sahib* may, or may not, have "respect for the Mohammedan creed"; but we pray that his wife's fears that "he likes to interrupt them when engaged in their religious exercises" may be groundless. An idle subaltern might pretend not to be aware that his Khidmutgar, or table-servant, was occupied in his devotions, and might call for soda-water; but we should hardly look for this sort of boyish freak from a minister of the Church of England. We repeat that this assertion ought to have as little foundation as the statement that good and orthodox Moslems should prostrate themselves three times a day. Genuine Moslem orthodoxy, in India, requires the *Namaz* to be said five times. However, the book has, as we have said, considerable merits. The country is comparatively new, the situations are picturesque and striking; the endurance shown tends to throw light on the problem why we are in India, and why, when we do lead, natives, whether Sepoys or coolies, must follow us. But we should not recommend ladies, or even gentlemen, who go to Darjeeling to shake off the languor of the plains, to follow the writer, unless they are prepared to see their paint freeze on the paper into a thin sheet of ice as it leaves the brush, hot water become a solid lump in a few minutes, and intense cold inflame the eyes and freeze up the young blood.

STOPFORD BROOKE'S PRIMER OF ENGLISH LITERATURE.*

A GREAT book, we know by the proverb, is apt to be a great mischief. To make up for the too many instances of this kind, however, we do sometimes meet with the contrary instance of a little book which is a great good, and such a one is this little Primer of English Literature contributed by Mr. Stopford Brooke to a series of useful little books. A brief, rational, and connected account of the writings which have assured the place of English among the great languages of the world, and of the men who wrote them, is manifestly a thing much to be desired, if the English language is to take, as surely it ought to take, a regular and important place in the education of English youth. Such a thing can hardly be said to have existed before this, at least in a separate form, and Mr. Stopford Brooke has supplied the want in a wonderfully small compass—although we must remark that the compass allotted to him is rather too scant for even the most condensed treatment of his subject—and, on the whole, with wonderful success. He does not affect an impossible simplicity, or assume that he is speaking to absolutely ignorant people, who have everything to learn from the book, and from the book only. On the contrary, he seems to assume throughout that he is dealing with at least fairly intelligent learners, and in some places that the learner will have at hand a fairly, or more than fairly, instructed and capable teacher, as the standard of teaching goes at present; but this is either no fault at all, or a fault so much on the right side that it would be a great mistake to lay stress on it. Also much of the usefulness of the book will naturally depend on the manner in which it is used. If it is treated as a school-book to be simply read by itself, so that one may be able to answer questions out of it, then it will doubtless be of some use—most likely far more so than the common run of books professing to give the same kind of information—but of much less use than it ought to be. If it is not thus worked through in a series of lessons and then laid aside, but kept at hand as a book of reference and explanation, to accompany the orderly reading of select specimens of English literature, such as those given by the Clarendon Press, and to fill up the tale of the literary surroundings of the chosen works, and the literary character of the intervals between them, then it will be used in accordance, as we presume, with the writer's intention, and in the way that will best enable it to produce the results at which it aims.

The first good point to notice about this book is that which strikes us at the very beginning; it is to be found, of course, in larger books, and perhaps in some school-books, but we have not as yet seen it distinctly given in any book smaller and more elementary than Mr. Kington Oliphant's *Standard English*. Mr. Stopford Brooke frankly accepts and firmly insists upon the perfect historical continuity of the English language and literature. Without hesitation or ambiguity he names Cædmon as the father of English poetry—a statement which is so near the truth that we will not stop to discuss its literal accuracy—and Alfred as the father of English prose; and at the very end of his course he looks back to the beginning over the twelve hundred years that have passed between the date of Cædmon's work and that of Mr. Tennyson's latest poem. Thus the pupil who has this Primer put into his hands can scarcely escape acquiring one leading conception about his own language which cannot be acquired too soon or too thoroughly. Another merit, and of a different kind, is in the handling of the great leading names; and this, it seems to us, is really the main thing to look to in a work of this kind. Doubtless it is important that the list of writers of lesser fame should be carefully chosen, their rank justly estimated, and whatever account is given of them sufficient within its bounds. But it is still more important that the student should be brought up from the first in a right and clear view of the greater lights. Let him learn aright something of those men whose names mark an epoch in letters, of the spirit of each one's work and the place he filled in his time, and in any case an assured good has been won. If he does not find the time or means to enlarge his knowledge afterwards, then he has at least made use of what time and means he had to know that which is best and most needful. If he does find them, then the new knowledge will readily group itself round the central points once established, and will fall without special effort into the fitting order. And therefore it is perhaps that, on taking up for the first time such a book as this, one turns, not to the least known, but to the best known, parts of the story; to the writer's account, not of those authors whose works one cannot well hope that the greater part of his readers will ever handle and judge for themselves, but of such as Chaucer, Shakspeare, and Wordsworth. Now this is exactly where we find Mr. Stopford Brooke to be the strongest. It would be an easy and not unnatural course to deal with the greatest poets simply by assigning them a greater proportion of space than others; one might fill up this space with their biographies, more or less well and skilfully written as the case might be, or with a catalogue or bibliographical account of their writings, or with a mixture of both; and it would be impossible for a critic to say that there was any harm in so doing. But Mr. Stopford Brooke is not content with any such procedure. He gives in each case a real poetic biography; he shows how the man's work was a part of his life, and the expression of its character and conditions from time to time, so that any one who reads this Primer aright will

* *Literature Primers. English Literature.* By the Rev. Stopford Brooke, M.A. London: Macmillan & Co. 1876.

not merely know of Chaucer, for example, that in certain decades of the fourteenth century there lived this Chaucer, who wrote such and such poems, and that these things are proper to be remembered if one wants to do well in examinations, but will have a living conception of the man and the poet Chaucer for which he will be the better, whether he is ever examined upon it or not. So in the case of Shakspeare, instead of a mere catalogue of his plays, followed by generalities about his greatness, there is a sketch of his life which brings out in a short compass what little may be known of its events, and of its reaction on his art, and this with such skill as to give a fresh significance to that little even for a reader already possessed of the facts; and the plays are interwoven in this account in the probable order of their production. Mr. Stopford Brooke, however, feels bound to be scrupulous as well as interesting, and adds in a note at the end of the chapter (we presume for the benefit of teachers) a frank warning that the arrangement of the plays is at present conjectural. So, again, the same qualities appear when we come to Wordsworth, though in the case of so modern a poet the rational treatment is perhaps less remarked, not being so manifestly different from what one has been accustomed to meet with. In a similar spirit the writer is careful not only to give the general facts of English literature in this or that period, but to make each period historically intelligible, and show what it had to do with the times next before and next after it. Thus attention is called betimes to the general interest in letters that prepared the way for the great Elizabethan writers, and to the more or less successful efforts of lesser men which preceded their triumph. Among the prose books of this time we are glad to see that Ascham's *Toxophilus* receives honourable mention, though its "quaint but charming English" does include, it must be confessed, though it is needless for students of the Primer to know it, some of the worst English hexameters ever written. In a later chapter, again, we are duly led up to the revival of poetry which has marked the present century; and here it is very satisfactory to see full prominence given to Blake as a forerunner of this movement. There is a little slip about Chatterton. His Rowley Poems were not "written with the old spelling," but in a spelling never seen before or since, which Chatterton imagined to be like old spelling.

A competent space is set aside for the History of modern prose, including the novel. It seems to us that Mr. Stopford Brooke goes rather too far in depreciating the Elizabethan and exalting the modern style. He says that when prose composition had become a complete art, "the boy of eighteen had no difficulty in making sentences which the Elizabethan writer could not have put together after fifty years of study." Surely this is a rather intemperate statement for an elementary book, and a double-edged compliment withal. In spite of the advantage of being "born, as it were, into a good school of the art of composition," many writers of our own time, of all ages from eighteen upwards, have no difficulty in making sentences which certainly no Elizabethan writer of any note either could or would have put together at any time after his studies were fairly begun. It also seems rash, though it is afterwards partly corrected by the context, to define the novel as arranging and combining events "round the passion of love and its course between two or more persons." It must be admitted, however, that the refractory instances, of which one can lay one's hand on several in French, are very few in English literature—*Tristram Shandy*, for example, being hardly a novel at all. As to this immortal eccentricity, by the way, Mr. Stopford Brooke's phrase "labyrinthine humour and falsetto sentiment" is in itself a happy one—that is, it is seen to be so by a reader who knows *Tristram Shandy*; but it is quite impossible to say what meaning, if any, it will convey to a boy who has not read *Tristram Shandy*. But this is one of the inevitable difficulties of condensed critical writing. Some other things we have noticed as not unlikely to fly over the heads of those for whom we presume the Primer is intended. They will not know, without explanations which do not occur in the text, who or what were "the fry of Grub Street"; nor will they appreciate the subtle distinction taken in the remark that Wordsworth is poetic in form even when he is prosaic in thought, and the accompanying allusion to Coleridge's criticism; and there is still less chance of their understanding some little bits of philosophy which come in now and then, in a manner that would be quite natural in a more advanced work, but which for this purpose it would have been better to keep clear of. Again, there is a certain excess of metaphorical expressions; it is desirable to have as little as possible of them in a first book, for nobody knows what odd things may not come into young heads by misunderstood metaphors, and give much trouble before they come out; and besides, the necessary condensation of language hardly leaves room for them.

We have grave doubts whether it would not have been better to say nothing of living writers. For once the pressure of space is too much for the teacher, and he breaks into a hurried and unordered list of names, which even as a list is insufficient. Students who have acquired an intelligent interest in the really historical part might be trusted to find out the living writers for themselves at their own time. All these, however, are but minor matters for consideration, possibly for revision when occasion comes, and are as dust in the balance against the general excellence of the work.

MERK'S EXCAVATIONS AT THE KESSLERLOCH.*

THOUGH less rich and varied in osseous deposits than some of the better-known caverns of Tertiary date, the recently discovered Kesslerloch cave has yielded results of no mean interest and value illustrative of the presence of man in Southern Europe during prehistoric times. For the discovery and exploration of this cave we are indebted to the sagacity and perseverance of a young votary of science, Mr. Conrad Merk, at the time Government teacher of practical science at Thayngen, a town of some mark in the canton of Schaffhausen, near the borders of the Grand Duchy of Baden. It was on a botanical excursion in the summer of 1873 that the cave of Kesslerloch first attracted Mr. Merk's attention, its mouth being nearly closed by the abundance of Alliaria officinalis, of which plant he was specially in quest. Pushing with some difficulty through the dense foliage into the yawning space in the background, he was astonished to find himself surrounded by bare walls of rock. Having given some attention to geology and prehistoric lore, the idea at once struck him that here might be found traces of human occupancy in remote ages. The pressure of other duties obliged him to put off further inquiry for six months; but early in December he set to work, aided by two of his elder pupils, shovel and pickaxe in hand, and for seven weeks pushed on the work of excavation with gratifying success. The Natural History Society of Schaffhausen now taking up the task, the cave was thoroughly explored, with the results which are set forth in Mr. Merk's interesting monograph, extracted from the Transactions of the Society, and well translated by Mr. John Edward Lee.

This curious cave took its name of Kesslerloch from having been the abode some fifty years ago of a family of tinkers or wandering smiths. It is situated in the side of a steep mass of white oolitic or jurassic limestone, here about 30 feet high, the last outpost of the Swiss Jura in the direction of Schaffhausen. The cavern has two entrances. That to the south, 10 feet broad, is about 7 feet above the level of the valley, and towards the west widens out into a cavity 23 feet long and from 3½ to 5 feet high. The eastern or principal opening, now distinctly seen from afar in the perpendicular rock, but then hidden by brushwood, forms a broad level portal 41 feet wide and 11 feet high. The cave extends about 51 feet into the interior, but decreases rapidly both in breadth and height. In the centre a pillar of weather-worn limestone upholds the roof, and behind it a kind of wall or screen divides the recess of the cave into two chambers. The roof and walls show various fissures and projections, which with numerous stalactites of all sizes give the whole a highly picturesque aspect. The entire superficies is set down by Mr. Merk as 2,000 square feet, and its cubical contents about 10,500 cubic feet. An ample supply of light from numerous clefts and fissures must have rendered it a highly eligible abode in troglodytic times.

The uppermost bed to be cut through and cleared away was a mass of rubbish formed of small and large angular blocks of white Jura limestone, fallen from the sides and roof, not rounded or worn by water; its thickness in front being from 47 to 55 inches, but decreasing towards the interior to 4 inches, or even less. One of these stones was fully 5 tons in weight, and must have caused an unpleasant surprise to the prehistoric group upon whose heads it probably came down. Some time was taken up in clearing away this upper rubbish, amounting as it did to nearly 4,300 cubic feet. Beneath it lay, in parts, two beds of stalagmite from 12 to 19 inches thick, so hard that it had to be broken up by gunpowder; both of the beds showed on the underside numerous bones with a few worked flints, a proof that when the stalagmite had begun to form the cave had been inhabited. Over the whole cave, under the rubbish, whether covered by stalagmite or not, there lay a rich black deposit, called the relic-bed (*Kulturschicht*), from its containing so many remains of early or incipient civilization, with a mass of bones of animals long since passed away. The thickness of this bed diminished towards the interior, suggesting, Mr. Merk thinks with reason, the inference that the early denizens of the cave had their day or working room in front, where they also took their meals, the hinder recesses serving for their sleeping space. What could not be eaten of their food was cast aside, after a fashion which is currently believed to have descended to mighty Oriental potentates of the present day, little heed being given to the unpleasant effluvium which must have been given off by the decaying animal matter. Our author is enabled out of the evidence yielded by these remains, and the conditions under which they were found, to draw a tolerably vivid picture of what may have been life in an ordinary prehistoric circle:—

> The bones in this bed, which were of a yellowish white colour, were easily preserved, but some few of the bones were so rotten that they crumbled to pieces in the hand. Many of the bones were either partially or entirely infiltrated with iron and manganese forming dendrites. In several places of the relic-bed there were hearths of different sizes, round which in general there were several slabs, which probably were used as seats for those who were sitting round the fire.
>
> On the north side of the cave there were three rather large slabs of what is called "oolitic marble," imbedded in fine rich loam. These may probably have been used as raised sleeping places or couches. Who had the distinction of occupying them, whether all the members of the clan, or merely the chief, we must leave undecided. At all events, I cannot agree with the view that these slabs were used as hearths or places of offering, for neither the

* *Excavations at the Kesslerloch, near Thayngen, Switzerland.* By Conrad Merk. Translated by John Edward Lee, F.S.A., F.G.S., &c. London: Longmans & Co. 1876.

slabs nor the loam show any trace of the action of fire. Neither can these slabs have been used as tables for working the loam upon, for not a single fragment of pottery was found in the whole of the relic-bed. It is quite clear that the slab is of the same age as the bones and implements found here, for a narrow strip or band of the relic-bed runs quite underneath it, while round about it it is much thicker. It is a peculiar and interesting fact that the relic-bed in front goes down deeply under the present surface of the valley; this has led me to many considerations as to the age of this bed, to which I hope to refer subsequently. Under the relic-bed, and extending over the whole of the cave, there was another bed *coloured red* with oxide of iron, and which consisted, like the others, of crumbled limestone. This bed also contained a number of bones and implements which were better preserved than the others, as they were constantly surrounded with the water of the soil, and thus were less exposed to the decomposing influences of atmospheric air. Here I may remark that water is very essential for the preservation of bones. Doubtless in prehistoric times every convenient cave was inhabited; but from the want of water the human and animal remains in the course of thousands of years have disappeared from the majority of these caves, so that with the exception of the flint-flakes every indication of the former inhabitants has been lost. The cave lately found in the neighbourhood of Berne is a proof of this.

The thickness of this second relic-bed varied from 14 inches to 2½ inches. It was not coloured black, probably because then the number of the Troglodytes was not so great, consequently the remains of their feasts were less, and the products of their decomposition were partly dissolved by the water and washed away underground.

Under this deposit lay an undisturbed stratum of yellow loam. The remains of bones gathered from this relic-bed weighed not less than thirty hundredweight. Every bone had been split up, with the obvious purpose of extracting the marrow, as is the custom with the Esquimaux at the present day. Not a single bone or fragment of bone but was thus broken. Nor was a single skeleton found entire. Not a sharp instrument of any kind, but some blunt implement, as a stone, had evidently been used for the purpose of fracture; nor did any bone show signs of being gnawed by animals—the inference being that man was not only the first but the only occupant of the Kesslerloch. Examined by Professor Rütimeyer, the osteological characters of these bones have yielded much valuable information regarding the fauna of the age and district. A comparative table exhibits with great clearness the various species whose remains are here represented, together with the proportions in which they are met with; a second table giving in parallel columns the corresponding statistics of the well-known caves of Belgium and Swabia, those of Veyrier and Aurignac, the kitchen-middens of Denmark and the lake-dwellings of Switzerland. With English caves we regret to find the writer so little acquainted as to be found excluding this country from the list of those in which the remains of the cave-bear are met with, an omission which has been very properly supplied by his translator. By far the most numerous remains yielded by the Kesslerloch are those of the reindeer, nearly ninety per cent. of the whole, at least as many as two hundred grown animals and fifty young ones being represented by the teeth and bony fragments brought together. The stag (*Cervus elephas*) is sparingly represented, and still more so the Urus (*Bos primigenius*), and bison (*Bos priscus*). Of the tame ox (*Bos taurus*) only two phalanges were met with, apparently identical with those of the marsh-cow of the lake-dwellings. The chamois and ibex have left a few of their remains. Of the Solidungula the horse alone is represented, the genuine *Equus caballus*. The number of animals eaten in the cave seems to have been about twenty, one-fifth of them young animals. They appear to have been not less in size than those of our day, but narrower in the hoof. The large proportion of foals naturally points to the animals having been wild, since, were they domesticated for use, they would scarcely have been taken for food so young. The pachyderms of the Kesslerloch are the mammoth or mastodon (*Elephas primigenius*) and the woolly rhinoceros (*R. tichorinus*); only three teeth, however, of the latter (an aged specimen it would seem) having been met with. Of the mammoth a considerable number of bones occur, of all ages, chiefly from the lower relic-bed. A tusk was found fifty-three inches long, weighing forty-two pounds; but, in spite of the most tender care, it fell to pieces. We have here another and a conclusive proof of the contemporaneousness of man and the mammoth. The wolf, fox, wild-cat, and lynx are shown to have yielded food to these cave-men, nor was the cave-lion too tough for them, sundry teeth and fragments of jawbones attesting the presence of this long extinct carnivore. Of birds there were the ptarmigan, the wild goose and swan, the sea-eagle, and raven. The vertebræ of a common snake, and bones of the shrew-mouse, and frog, probably indicate a more recent visitation of the cave. No vestige whatever presented itself of the pig, or of the red-deer, so common among the lake-dwellings and the Danish refuse-heaps, nor yet of the hyæna, whose numerous remains betoken his occupancy of Kent's Cavern, Torquay.

Although no human bone has been discovered among the *débris* yielded by the Kesslerloch, the presence of man is vouched for, not only by the condition of the bony fragments before mentioned, but by other clear indications. In no single case, perhaps, have specimens of man's early workmanship been turned up in equal multiplicity, variety, and excellence. Flint flakes, not less than 12,000 in number, weighing 7 cwt., have been picked out of the rubbish, many of them fine in shape and size, having evidently served as knives or lance and arrow heads, or as scrapers and other tools, besides sundry "cores," from which the flakes were struck. Other implements and weapons were made of bone, chiefly that of the reindeer, of which countless fragments were found in all stages of progress, indicating most clearly the mode of manufacture. The lithographic plates appended, fifteen in number, give admirable representations of the various classes of objects. Nowhere in prehistoric times does art appear to higher advantage than among the rude men of Kesslerloch. One or two of the worked flints or earrings are rounded and embossed with a degree of taste and finish by no means to be despised at the present day. No trace of metal has been met with, if we except a lump or two of iron pyrites. A single fragment of pottery with round holes stamped in the clay, similar to those met with in many lake-dwellings, alone represents the plastic art of that early day. But beyond all, for artistic treatment and perception of nature, are the etchings of animals upon smoothed antlers of the reindeer, and in one or two instances upon pieces of coal. The best preserved as well as the best executed of these are the heads and whole side figures of horses, and, beyond all, the highly expressive full length of a reindeer browsing, which Mr. Merk's interesting little volume shows upon its cover. Nothing can well surpass the fidelity to nature which the early artist has put forth in the attitude of the animal, whom he had obviously before his eyes as he scratched the hard horn with his simple burin of flint, the backward sweep of the branching horns being given with consummate truth. This etching is worthy of rank by the side of the well-known mammoth from the caves of Southern France. Of inferior purity in taste there are vague indications in a couple of pieces of soft ruddle, or red oxide, strongly suggestive of the practice of painting the face. With this pigment a slab of stone is found to have been regularly coloured.

Altogether, from the absence of metals, of ground stone implements, of any trace of corn, or of domestic animals, an age may be inferred for these simple savages earlier far than that of the lake-dwellings in the neighbourhood. Mr. Merk's closing remarks make out an inductive argument of great force for a range of time far back in the Glacial age, when the glaciers stretched far into Northern Switzerland.

THROUGH THE AGES.*

THE Count de Pomar some time ago produced a work entitled the *Honeymoon*, which bore an external resemblance to a novel. The resemblance to many novels was carried further by the extreme folly of its contents, which consisted in part of a collection of letters on the subject of Spiritualism, mixed up with the transmigration of souls. It is an ancient opinion enough that the soul of our grandam might haply inhabit a bird; but it remained for the Count de Pomar to devote volumes of trash to connecting this creed with the modern folly of table-rapping. There is something, however, far worse than mere trash in the bulky volumes with which he has followed up the *Honeymoon*, and which he has been pleased to call "A Psychological Romance," thus reminding us of one of Mr. Disraeli's most brilliant works. With a condescension that cannot be too highly commended, the later writer has in his preface quoted from Mr. Disraeli's introduction to *Contarini Fleming* a passage which begins with the words, "I am desirous of writing a book which shall be all truth;" and he has modestly added, "This has also been my object in writing the following pages, which have sprung as it were naturally out of those of the *Honeymoon*." If it were natural that any one should write the *Honeymoon*, it might no doubt be also natural that he should follow it up with *Through the Ages;* but if the Count de Pomar's object really was to write a book which should be all truth, he has taken very singular means to obtain it.

The hero of the *Honeymoon* was a certain Lord Carlton, who had married a "lovely Spanish bride" named Conchita. *Through the Ages* opens, two years after his marriage, with the death of Conchita at Carlton Hall. Lord Carlton's fears for this event are presented to us with a sublime bathos. He had lingered long smoking his Havannah on the stately marble terrace that encircled two sides of the old building, and he trembled at the thought that she might be called to quit the old tower for a more beautiful and enduring mansion. "I could think of nothing else; I tried over and over again to drive the maddening idea from my oppressed brain; but no, it would return, and each time more horribly distinct than before. A thought came over me, 'Could this be a presentiment?' and my heart sank within me at the idea. 'But no, it cannot be!' I exclaimed; 'the doctor told me only half-an-hour ago that she was going on as well as we could hope under the alarming crisis which was causing us so much anxiety.'" But Count de Pomar displays considerable originality in departing from the rules of ordinary novelists who kill off their characters in order to get rid of them. Conchita only dies in order that she may reappear. Lord Carlton after her death makes a voyage to America, during which he obtains, from watching the phosphorescent light on the sea, "a consolation that not all the sympathy of my friends could obtain for me with their stereotyped consolations." Certainly the phosphorescence on the water has the merit of not being stereotyped, but where its comfort comes from it is not so easy to see. Lord Carlton travels in America, and makes some records, which are doubtless interesting, of his impressions. "Fifty years ago, months were necessary to transmit news to Europe, to hold, indeed, any sort of communication with the Old World. To-day the electric telegraph flies the broad Atlantic with the rapidity of lightning, and our message is received in America four hours before it left London." He presently takes occasion—and here we may suppose that the name of

* *Through the Ages: A Psychological Romance.* By the Author of "The Honeymoon." 3 vols. London: Chapman and Hall. 1876.

Lord Carlton is a veil for another—to "thank the different companies of the American railways and their presidents for their unbounded kindness," which never allowed him to pay a railway fare, and often even provided him with "sumptuous luncheons." But the sumptuous luncheons are found less admirable than Niagara, of which the writer says, "Great God! who can describe the effect this glorious sight has on the heart of thy adoring creature!" Apparently Count de Pomar imagines that he is the person who can do this, for he proceeds to do so in the person of Lord Carlton. He also gives a description of Luna Island, where he saw "the extraordinary phenomenon of the lunar rainbow, which, I believe, can only be seen here." This belief is as singular as that in Spiritualism, to which *Through the Ages* owes its existence. He also goes below the Falls, and finds that much amusement is derived from the waterproof dresses assumed for that purpose; "but here," he adds, for the guidance of future travellers, "all the fun ceases, for the excursion is much too dangerous to be amusing or even pleasant."

These experiences, however, are the least important which Lord Carlton undergoes. When he returns to New York he falls in with a believer in Spiritualism who wonders that he has never been at a *séance*, and feels sure that now he has lost his dear wife he must need it. Moved by this argument he goes to the house of a well-known medium, and there receives a "communication" written on a slate by the dead Conchita. The next day after this occurrence he spends in "arguing," as he is pleased to call it, against himself on the subject of Spiritualism, and appeals to "the Vedas, the Eddas, the Zend-Avesta, the Koran," and "a magnificent article in the *Fortnightly Review*." The next day at the medium's house Conchita appears to him: a detailed account is given of the vision, and a foot-note to the chapter states that "The apparition described in the preceding chapter is not imaginary, but was really witnessed exactly in the manner related by the author, at the house of Dr. Slade, 143rd Street, New York." This reminds one of the marvellous stories which writers of Miss Edgeworth's time were wont to insert in their books, and confirm with the words "A fact" in a note. Their method had the advantage of Count de Pomar's in conciseness. In the course of another voyage Lord Carlton meets a certain professor, who finds in the well-known fact of persons thinking that they still feel an amputated limb, "proof positive that the spirit and the body are of the same shape," whatever that may mean. It may perhaps be a way of accounting for the ghost of a cocked-hat, and for the pieces of fabric which the celebrated spirit Katie was accustomed to dispense to her friends while she was yet believed in. Some time after this, Lord Carlton, after dreaming of Conchita, finds on his table a mysterious paper covered with unintelligible marks, which he is kind enough to reproduce, and which turns out to be a letter written in cipher—why in cipher it is idle to inquire—by his dead wife. Not long after this Conchita herself reappears, and in a kind of Arabian Nights Entertainment running through the greater part of three large volumes discourses not only of the things which happened to her after her death, but of those which occurred to her in former states of existence before she was Conchita Vargas. In the course of the third volume the author—for we may fairly take Lord Carlton here to represent himself—observes, "I shall be laughed at, called a fool, a blasphemer, a madman. I care not, for by such names Socrates, Galileo, Columbus, and a host of others were known before me, whom men at last have learnt to appreciate in their proper light." We think it highly probable that Count de Pomar will be called by all these names; but we are not disposed to accept his inference that he will go down to posterity with Socrates, Galileo, and Columbus. It is indeed easy enough to appreciate him in his proper light at once.

We should not have inflicted on our readers any notice of the rubbish which he has compiled but for one fact. He has said that the name of blasphemer is likely to be applied to him, and this is one of the few true things in a book whose avowed object is to be all truth. What name, indeed, could be more fitly given to an author who makes part of a novel out of things which have been told, most people will think better than he can tell them, by the Evangelists? It sounds incredible, but it is not the less true, that a large portion of the Arabian Nights Entertainment provided by his spirit wife for Lord Carlton is taken from the New Testament. Mary Magdalene appears as the central figure of what might be a fourth-rate French novel, and the Saviour is frequently brought on the scene. The author reprints the Sermon on the Mount, substituting "you" here and there for "ye," and changing the last words "great was the fall of it" to "great was the fall thereof." He also records two or three of the miracles, which, by the way, he ascribes to the influence of magnetism, partly in the familiar language of the Gospel, partly in his own. Having said thus much, it is hardly worth while to add that the author's own language is in other passages decidedly coarse. We need not trouble our readers any longer with this distasteful subject; but it seemed desirable to warn them against a book which, appearing in the guise of a novel, contains not only a vast amount of folly, which is not strange in novels, but also a large amount of profanity, which happily is. Count de Pomar ends his volumes by observing, "I am glad I have at last come to the end of this long and wearisome book." He is the only person who is likely ever to complete this journey.

ENAMELLING IN ANCIENT GAUL.*

IT has long been supposed by French antiquaries, and is still believed, notwithstanding recent discoveries, by the majority of them, that the ancient Gauls were not skilful enough in the arts to understand and practise enamelling. The excavations on Mount Beuvray which have now been pursued for many successive summers by the learned President of the Société Éduenne have, however, not only brought to light a certain quantity of Gaulish enamelled work, but have even exhibited the workshops of the enamellers, with abundant evidence that they had laboured there at this particular occupation. A brief account of what has been discovered about ancient enamelling on the Beuvray has been lately published, and will supply material for the present article; but the writer may add that he is perfectly familiar with the locality where the objects were discovered, and was actually present when some of the most interesting discoveries were made. He has also carefully examined many of the specimens found when he was not on the spot, and therefore, whatever confirmation he may give to the views of the authors is the confirmation not simply of a critic, but of an eye-witness.

We have not space to enter into the great controversy about the situation of the Gaulish fortress of Bibracte. Until recent investigations it was almost, though not quite, universally believed that Bibracte and Augustodunum were the same place, or, in other words, that the Gaulish city of Bibracte occupied the site of the modern Autun. All the geographies used in schools all over the world say that Augustodunum was built on the site of Bibracte. A few French antiquaries have, however, at different times expressed the opinion that the Gaulish fortress-city more probably occupied the summit of Mount Beuvray, an isolated *mamelon* at the extreme south of the Morvan hills, about two thousand five hundred feet above the level of the sea, and twenty-five kilomètres west of Autun. An expression of Strabo in the following passage appears to confirm this view:—

Μεταξὺ μὲν οὖν τοῦ Δούβιος καὶ τοῦ Ἄραρος οἰκεῖ τὸ τῶν Ἑδούων ἔθνος, πόλιν ἔχον Καβυλλῖνον ἐπὶ τῷ Ἄραρι καὶ φρούριον Βίβρακτα.

Here the ancient geographer makes a clear distinction between a town, Châlon, and a fortress, Bibracte, between *πόλιν* and *φρούριον*. The latter word, having been used to distinguish hill-forts from fortified towns, appears especially to indicate that Bibracte must have been built upon a hill. There was evidently also an etymological connexion between Bibracte and Beuvray, the transition having been effected through the historical form *Bibractum*. These considerations led to a thorough investigation of the subject, not only by antiquaries in their studies, but by excavators with spade and pickaxe working under the direction of M. Bulliot. The consequence of these works, pursued year after year with admirable perseverance, has been the disinterment of hundreds of Gaulish dwellings on the top of the Beuvray within a complete circle of ancient ramparts which run round the hill very much as a laurel crown goes round the head of a Roman general. The question is now therefore very generally considered as settled, and even Hachette's guide-books now place Bibracte on the Beuvray.

The results of the excavations show that on the arrival of the Romans the Gaulish fortress was no longer one of those temporary refuges where the surrounding rural population went in times of danger to obtain protection for their goods and cattle; it was a sort of town, where men of different occupations went to live regularly that they might be protected in the exercise of their industry. The trades would appear to have had their special quarters in the place. The part of Bibracte which has hitherto been most thoroughly explored seems to have been occupied exclusively by workers in metal. They lived near one of the entrance gates, from which a street penetrates into the heart of the fortress. On the right-hand side of this street seventy houses have been disinterred, and these included a great number of workshops for the preparation of bronze, traces of which have been found abundantly in the crucibles. Many other houses were laid bare on the left-hand side of the street, and these were occupied by smiths in different metals, including both blacksmiths and goldsmiths. The workshops were on a considerable scale, the biggest of them being nearly fifty yards long. Behind these workshops the land slopes down rapidly into a gully or ravine, where there is a little stream of water, and between the stream and the workshops were many mean habitations of the artificers, half buried in the soil, even when originally built. There is abundant and convincing evidence that some of these were inhabited by enamellers. We will now let our authors speak for themselves:—

Le travail de l'émaillerie qui confine à l'art apparaissait pour la première fois au centre de la Gaule avec des dates certaines et des preuves d'une authenticité irréfutable, car on n'avait pas seulement mis à jour quelques échantillons isolés, mais tout un centre de fabrication dont les ateliers, comme dans certaines fouilles de Pompeï, n'auraient paru fermés que de la veille, si l'état d'altération d'un grand nombre d'objets n'eût témoigné d'un long séjour au sein de la terre.

Les ustensiles gisaient pêle-mêle, les fours étaient encore remplis de charbon; à côté de spécimens complétement terminés, on en voyait d'autres à peine ébauchés, d'autres en pleine fabrication, l'un même encore enveloppé

* *L'Art de l'Émaillerie chez les Éduens avant l'ère Chrétienne.* Par J. G. Bulliot et Henry de Fontenay. Paris: Champion. London: Pickering.

de terre cuite; tout autour des fragments d'émail brut, des creusets de terre, des grès à polir, une quantité considérable de déchets, des bavures, des rognures provenant de la taille, des coques vitreuses qui conservaient l'empreinte des dessins du bronze, et par-dessus tout, le témoin même des opérations, véritable fossile de nos terrains historiques, nous voulons parler de la médaille qui en fixe l'âge et l'époque.

One of the joint authors of the *brochure* before us, M. Henry de Fontenay, is a son of the director of the famous *cristallerie* at Baccarat, and has been prepared by his own studies in chemistry and its applications to the glass manufacture for a thorough technical analysis of Gaulish enamelling in the specimens which have lately been discovered. His observations on the technical part of the subject are clear and interesting, and add greatly to the value of the work. It is probable that many of our own readers may be glad to know exactly what enamelling is, and how it is done in the present day, as well as how the Gauls did it two thousand years ago.

M. de Fontenay begins by a definition of enamel. It is, he says, any glassy substance, whether transparent or opaque, colourless or coloured, which can be applied to metals by the action of fire. He insists upon the necessity of keeping the French word to its special use, and protests against the misapplication of it to the mere colouring of pottery. If we go to etymology we do not find that the word *émail* necessarily means enamelling on metal only, though it may be convenient to restrict it to that special sense. The fact is that *émailler* and the English word *smelt* are in their origin perfectly identical and alike mean *liquefacere*, so that the vulgar use of *émailler* for the colouring of pottery may not be incorrect when the colouring substance is made to adhere to the pottery by fusion. It is, however, a good habit to restrict the meaning of words to particular uses when there are plenty of them to choose from, and in the present instance M. de Fontenay lets us know very clearly what he means. He does not merely mean that the ancient Gauls applied different colouring substances to their pottery by fusion, but he means that they knew and practised the art of applying vitreous paste to metal. It was not believed until quite recently that they were sufficiently advanced in the arts to know how to do this, and the recent discoveries on Mount Beuvray are highly interesting for the light they throw upon the condition of a people concerning whom there is so much curiosity amongst historical students and so very little to satisfy it.

The vitreous pastes used in enamelling on metal can be applied either with a brush or a spatula, and either upon the surface of the metal or in hollows made to receive them. The paste is then left to dry a little, and afterwards melted by a strong heat, when it remains fixed and becomes that hard coloured substance which we call enamel. Little walls of metal, like the divisions of the honeycomb, are often left between pastes of different colours which have been used to fill the cavities. The antiquity of the process has been a subject of controversy amongst antiquaries, some of whom make it go back several thousand years, whilst others deny that it was known before the second or third century of the Christian era. The latter opinion has been maintained by M. Delaborde in his notice of the enamels in the Louvre. He says that what are called the Egyptian enamels are really not enamels at all, but pastes inlaid without fusion and covered with bits of glass, or else simply inlaid stones; and he calls this a rude expedient. Now comes M. de Fontenay, who brings his technical knowledge to bear upon the subject, and begins by admitting that M. Delaborde's description of the so-called Egyptian enamels is quite correct for most of them, but affirms that some, though not many, specimens of Egyptian work are unquestionably real enamels, and that those which are not so were rough imitations of the effects of enamelling, in all likelihood produced by workmen who had seen the real thing. One point of great interest is established by M. de Fontenay. Enamels are generally supposed to be indestructible by time. He says that this is a mistake, and that, so far from being indestructible, the vitrified pastes are subject to different causes of slow deterioration, due to their chemical composition and the places where they have remained, that they are tenderer than common glass, and more sensitive to the influences which act upon common glass. If the proportion of alkali has been exaggerated to make enamel more fusible, or if the objects have been long exposed to damp and the effects of the atmosphere, they are still more rapidly destroyed. Even the stained glass of the windows in Gothic cathedrals, especially when red, is often so much eaten that it looks like worm-eaten wood. This question of the durability of enamel is of the utmost importance in a controversy about the antiquity of the art, because, so long as antiquaries believe enamel to be indestructible, of course they say that when it has been destroyed it was not enamel. M. de Fontenay's way of investigating the subject is to get specimens of the pastes which happen to have survived destruction, and subject them to regular chemical analysis.

The proofs that these specimens of Gaulish enamel are anterior to the Christian era appear to be perfectly satisfactory to the authors of the little work before us, and we see no reason to suppose that they are mistaken. One proof is the numismatic evidence, and although that is only negative, it must be allowed a certain weight. Sixty Gaulish medals were found in the habitations of the enamellers, and not one of them was later than the Christian era. The same may be said of five hundred medals found in the same part of Bibracte, which were all Gaulish, without a single specimen of Roman money. A still stronger argument for the purely Celtic character of these enamels is that they betray no Roman artistic influence. The ornamentation is exclusively of that primitive kind which was the fashion in uncontaminated Gaul, and which is familiar to students of the subject on the abundant specimens of Gaulish pottery which have been recovered by modern research. It may even be especially noticed that the ornamentation on the Gaulish enamels found upon Mount Beuvray is identical with that employed upon pottery found in the same place, and has consequently that decided mark of artistic peculiarity which is one of the strongest evidences of origin. It is inconceivable that a Roman artificer would have consented to limit himself to a style of ornament which his taste would justly have considered little better than the design of savages; and it is almost equally unlikely that a Gaul who had been the pupil of a Roman workman would have exhibited no trace of Roman character in his work.

The first traces of these Gaulish enamels were discovered in the year 1867 during the excavation of the *oppidum* on Mount Beuvray, but the specimens were in such a bad condition that it was thought better to make no public announcement at that time. The next year other specimens of a like character were brought to light, especially in a workshop which had been used by artificers in bronze. Amongst many *débris* of their industry were found small studs with hemispherical heads, ornamented with regular engraved lines, which appeared to have contained a red paste, and pieces of sandstone were found with holes sunk in them which exactly corresponded to these studs, but their use was not understood at the time. In 1869, as the excavations were continued year after year, an opaque vitreous mass was found, of a red colour, with the impression of the above-mentioned studs. A little later the excavators came upon a goldsmith's workshop where the work of enamelling had been carried on. The floor of this place contained many little fragments of coloured enamel which had been trodden under foot by the workmen and so buried in the ground. These were found in such quantity that our antiquaries infer that there must have been rather an important trade in enamelled ornaments at Bibracte before the arrival of Cæsar. It is quite certain that there was a great fair there, and the fair has survived the φροὺριον, for it was continued all through the middle ages without interruption, and is still maintained on the first Wednesday in the month of May. This was a religious festival at the beginning in honour of a local goddess, the Dea Bibracte. The following quotation explains the sort of merchandize prepared by the more artistic artificers in metal:—

> Le luxe des Gaulois consistant alors presque uniquement à avoir de belles armes et de riches harnais, les forgerons-orfevres consacraient leur industrie à tous les objets propres à l'équipement du guerrier et de son cheval, cette branche de leur métier étant appréciée par-dessus tout, et la seule dont on fit cas. En même temps qu'ils s'ingéniaient à fabriquer des épées sans défaut et de solides boucliers, ils appliquaient leur art décoratif à l'ornementation de ces mêmes armes, des chars, et des harnais. C'est ainsi que le placage d'or et d'argent (dont Pline attribue l'invention aux Gaulois) fut d'abord mis en œuvre pour les ornements de sellerie; et cela nous explique en même temps comment, ayant le choix entre tant de pièces à décorer par l'émail, les orfèvres éduens ont choisi à peu près exclusivement ainsi qu'on le verra, des pommeaux, des bossettes, des fleurons et des têtes de clous-ornements pour les brides, les colliers, les traits, en un mot tout ce qui touche à l'attelage et au harnachement.

The enamel found on the Beuvray apart from enamelled things in metal is always in one of three forms; either it is the rough material not yet applied to use, or else scrapings and parings; or, lastly, thin glassy skins of enamel which have peeled off the bronze on account of defective baking. The scrapings and parings were removed from the bronzes before the paste had hardened. All these scraps, which have been found in countless numbers, are blood-red, which appears to have been the fashionable colour amongst the Gauls of Bibracte and the neighbourhood. With regard to the bronzes, MM. Bulliot and de Fontenay divide them into three classes—the specimens rough from the casting and not yet either engraved or enamelled, the bronzes engraved for the enameller but not yet filled with enamel, and, lastly, those which are enamelled and finished. One specimen was found in the middle of the process partly covered with calcined clay, with its head covered with a crust of enamel. The finished bronzes are bridle-ornaments, not of a very elaborate description. The authors note a curious instance of traditional persistence in the same forms. An enamelled boss found on Mount Beuvray gives a pattern which is still exactly reproduced in plaited silk by the saddlers of Paris. We may mention as a parallel example the persistence of the antique wave ornament in the common pottery of south-eastern France; this was brought by the Phœnicians to Marseilles, and you may still find it any market-day at the stalls of the potters. Our antiquaries have had the luck to find some of the tools used by the Gaulish enamellers, such as crucibles in fragments, a little shovel with a long handle to stir the hot charcoal, a tripod to carry the crucible, polishing stones of all sizes to polish the studs and bosses after enamelling, with holes exactly corresponding to them, pairs of pincers, &c.

M. de Fontenay gives a most interesting chapter on his own experiments upon the enamels found on the Beuvray. He has tried to enamel with the rough material provided by the Gaulish artificers, and succeeded perfectly. He also used the old Gaulish polishing stones, and in this way, using nothing but the materials of the ancient workman, M. de Fontenay has accurately imitated the Gaulish enamels from Mount Beuvray which are now at the Museum of St. Germain. He gives the results of his careful chemical analysis, and demonstrates that the process followed by

the Gauls was the primitive one of pouring the melted enamel directly upon the heated bronze. The object was surrounded with clay so as to make a little cup of clay round the portion of the bronze which was to be enamelled; it was then heated with the clay round it in a charcoal fire near the crucible which contained the molten enamel. When the bronze was hot enough a little enamel was poured upon it, before it cooled the superfluous enamel was partly removed, and after cooling was entirely removed by polishing, leaving none but what remained in the incised lines. The whole of the process is exhibited in the fragments which have been found. We think that MM. Bulliot and de Fontenay deserve to be congratulated on the patience and care with which they have collected and examined the evidence given by the excavations on Mount Beuvray. They have certainly added an interesting chapter to the history of the primitive arts.

Since these discoveries on the Beuvray attention has been directed to a good many enamelled objects already classed in the museums as Gallo-Roman, or even Merovingian; and the result has been their reclassification as purely Gaulish work, especially when they have been found in some unquestionable Gaulish oppidum, such as Gergovia, for example, where a large and handsome belt-plate was found some time ago, most of which was covered with enamel alternating with bronze ornaments. This is in the museum at Clermont, where is another plate ornamented with engraved lozenges which were once filled with enamel. Subsequently to the publication of the *brochure* by MM. Bulliot and de Fontenay an enamelled bronze of much greater importance than any previously found on the Beuvray has been discovered there and sent to the museum at St. Germain. It is of open work and ornamented with little enamelled plates like the studs which we have already described. Most probably, from its size and shape, it was an ornament for a horse fastened by two rivets to the leather head-piece, and hanging loosely on the forehead.

BANCROFT'S NATIVE RACES OF THE PACIFIC.—VOL. IV.*

IN his fourth volume Mr. Bancroft confines his attention to all structures and buildings of every kind, found in the territories of the Pacific States of North America, which do not manifestly belong to the Christian invaders of the country. Beginning, for the mere sake of convenience, with Costa Rica and Nicaragua in the extreme South-East, he works his way step by step to the North-West until he reaches Arizona and New Mexico, a notice of the antiquities of Peru being reserved for the last chapter.

As in the volumes which we have already reviewed, so here, Mr. Bancroft writes not for those who seek amusement or the pleasant excitement of a subject full of stirring interest, but for patient workers for whom the acquisition of a grain of truth is a sufficient reward after groping through a heap of sand. Not a single question connected with any part of the human race is without its importance, and it is obviously impossible to say what effect on the ethnological or other science of coming generations may be produced by the careful ascertainment of facts relating to so considerable a portion of the human family as that which has occupied the regions of Central America. The social and political life, the manners and customs, the laws, the religions, and the dialects of these tribes Mr. Bancroft has examined in his preceding volumes; and the credit which he claims for himself is simply this, that in each single volume he has taken an integral part of the subject and summed up in the compass of seven or eight hundred pages the contents of almost the same number of volumes; and that, by means of ample quotations and exact references, he has done his work in such a way as to make it unnecessary for the antiquary even to consult those volumes. If in noticing his previous volumes we have felt bound to admit that the task of compression might with advantage have been carried a good deal further, we are quite aware of the danger which must attend a careless or hasty examination of ground no part of which must be left untraversed. In truth, it must be confessed that in no inconsiderable degree the interest attaching to the whole subject is one rather of an indirect kind. The civilization and the works of these tribes of Pacific America are not of a sort to rivet our attention either by their wisdom, their majesty, or their beauty. In many parts we must move wearily as over an arid wilderness; from much we must feel tempted to turn away with intolerable loathing; and probably there are not ten men living who could brace themselves to the task of bringing all the facts of the subject together, as they lie scattered in the volumes, often ponderous, more often for the most part worthless, of hundreds of observers writing in half a dozen languages. We may thus measure the debt of gratitude which archæologists and historians owe to Mr. Bancroft, when we find that this fourth volume "embodies the researches of some five hundred travellers, stated not merely *en résumé*, but reproduced, so far as facts and results are concerned, in full"; that his notes are "a complete index to all that has been written on the subject," while they also contain "bibliographical notices and historical details of the discovery and successive explorations of each ruin."

The reader, then, who would go through the whole of this volume with the determination to lose sight of no fact, however minute, which may be mentioned in it, must be almost as patient as the author; but for those who may shrink from this task it may be well to say that the general result of Mr. Bancroft's archæological inquiry has been to strip the subject of much of its mystery, and to throw cold water on theories which attribute many of the antiquities of the Central or other parts of America to long extinct races, or which again connect these vanished races with the populations of the Old World. It cannot, however, be denied that the general survey of the ruined cities or isolated buildings and mounds brings us to certain conclusions respecting the civilization of the people who raised them, and that in the general agreement of these conclusions with the evidence of their traditions and of such knowledge of their religion and government as we happen to possess lies the fact which is at once most interesting and most important. In themselves many of these ruins, as Mr. Bancroft frankly admits, have little to attract either the spectator or the reader. In Nicaragua (67), and again in Guatemala (108), the ruins and relics discovered point to a stationary condition of tribes who were found by the European invaders in a very low stage of civilization. In such cases little more can be said than that the relics in question must be more than three hundred years old, and may possibly be three thousand.

Far more instructive are the remains of the city now known by the name of Copan on the river of this name, which joins the Motagua about a hundred miles from its mouth in the Gulf of Honduras. What the real name of this ruined city may have been is not known; the notion that it was inhabited at the time of the Spanish conquest has arisen from the idea that it was the abode of the Copan chief who, after a fierce resistance, was compelled to submit to Hernando de Chaves in 1530. This theory Mr. Bancroft regards as effectually set aside by the fact that, some six years earlier, Cortes, passing within a few miles of the place, never heard of a city which, if inhabited at the time, must have attracted him to its conquest, and that not half a century later the ruins are described as being much in their present condition. The great temple of this city is still imposing in its ruin. Inclosing an area of 900 by 1,600 feet, its walls rise to heights varying from seventy to a hundred and twenty feet, sloping on all except the river side, where it rises perpendicularly, the summit of its mighty mass covered with tropical vegetation. Within this area are two large rectangular sunken courts, from which steps ascend on all sides, as in a Roman amphitheatre. On the three pyramids also contained within it no traces of any superstructure now remain, nor in all Copan have any covered buildings been found. The likelihood is that grand temples wrought in wood crowned these mounds, and that time has eaten away every vestige of these structures. On some stones, popularly known as altars, there remain indeed hieroglyphic inscriptions which, if deciphered, might tell us something not only about these temples, but about the history of the city. Of this decipherment there is little hope. Bilingual inscriptions, like that of the Rosetta stone, would be of no use where both the languages have perished, and the stones of Copan will probably guard their secret with better success than the sepulchres of Etruria.

But if of actual history we have nothing, and if these large wooden temples are lost to us irretrievably, it may fairly be said that the smaller antiquities of the place tell us much about the people; and here, as everywhere else throughout these wide regions, the conclusion forced on us is invariably the same. The carved obelisks, statues, and idols exhibit certainly no mean skill in the handling of instruments and in the management of forms so as to produce a certain effect of grandeur. The carving is often extremely minute, and is undercut with singular force, producing strong contrasts of light and shade; but here, in the strict interests of truth, the praise should end. Confining ourselves to those characteristics, which may mark the art of any savage people, we may safely speak of these obelisks, or statues, as "most wonderful creations of American art" (94); nor perhaps need we take exception to the eulogy of the well-known traveller Stephens, who describes much of the work at Copan as being "equal to the finest Egyptian sculpture" (103), although some may think that eulogy is here pushed to its utmost limits. But the student of European art must simply protest when Mr. Stephens, speaking of some fragments of figures found at Palenque, pronounces them "to approach the Greek models in justness of proportion and symmetry" (331). Nothing is gained by professing to discover anywhere excellences which do not exist; and to attribute to these American carvers anything even remotely approaching to the touch and the feeling of Pheidias is simply to draw a veil over the history of the Western Continent so far as it is read to us in the buildings or the traditions of the people. Few facts can be more impressive than that which in these American cities meets us everywhere, telling us, with an awful monotony of iteration, of a people oppressed by an atmosphere of appalling and unvarying hideousness. The structures of Uxmal and Palenque must have been, indeed some of them still are, imposing in their general outlines. Their mighty masses of wall have something even of the grandeur of an Egyptian pyramid, while their stone vaults, exhibiting some approach to the principle of the key-stoned arch, must have impressed on the beholder the sense of victory over great mechanical difficulties; but, beyond the impressions of power and majesty thus left on the mind, there would have been only the crushing feeling that the world was governed by a multitude of pitiless devils. We may take the richest and the most elaborate of the obelisks or statues of Copan or Mexico, and we find in the faces and figures carved upon them nothing but forms of ugliness

* *The Native Races of the Pacific States of North America.* By Hubert Howe Bancroft. Vol. IV. Antiquities. London: 1875.

so astounding that it is hard, indeed, to look upon the result as accidental. Throughout, these mute stones seem to tell us that the art of the country was in the hands of men who used it deliberately as an instrument for terrifying the people into an absolute submission to a religion of murder and blood. That this would be the case with the images of the gods of war and death, with their loathsome footstools of human hearts, cannot be questioned. Here every form is purposely and studiously disgusting; but we can scarcely say much less of their conventional foliage, and even of the patterns of their arabesque. The forms carved on the celebrated Casa del Gobernador at Uxmal are elaborate, indeed, and intricate; but we shall look in vain for a single outline to indicate the wakening of the faintest feeling of tenderness and grace in the mind of the artist; nor is the strength of this condemnation at all weakened by the fact that we may find great beauty of mere workmanship. The drawing by Catherwood of the bean-relief found in the temple called after it at Palenque (329) may in no way exaggerate its merits; but its forms are monstrous as contrasted even with English sculpture of the twelfth century, which few would venture to compare with the symmetry and proportion of Greek art. We may take, again, the so-called "Tablet of the Cross" (333), found in the same city, in which two priests are seemingly worshipping before a cross surmounted by a winged creature which may be a cock, a turkey, or a basilisk; but even here we find, with something more of an acquaintance with the anatomy of the human frame, the same exhibition of hideous features, which never could have characterized the people, and which therefore we seem forced to regard as put on designedly for the purpose of scaring them.

Nor can we well overlook the significance of another circumstance which seems to justify this estimate of American art. Rightly cautious as Mr. Bancroft is in drawing general conclusions, and much as he dislikes theorizing, he is driven on a survey of the whole evidence to admit that the reasons for ascribing these works to races extinct now, or at the time of the European conquest, are slight indeed, if not utterly worthless. There is nothing to disprove, there seems everything to establish, the fact that they are the work of tribes whose degenerate descendants have but lately passed away, or still survive without even the memory of their ancient splendour. But, except on the supposition that the art of the country was used merely as an instrument for oppression of the most horrible kind, such deterioration in so short a time seems well nigh incredible; and we shall have more chance of reading their history aright if we assign to the relics of their art no more than their true value.

We make no attempt to follow Mr. Bancroft step by step through his long journey of exploration. It is enough to say that all which perhaps even the most exacting antiquary needs to know will be found in Mr. Bancroft's pages.

DYER'S BRITISH POPULAR CUSTOMS.*

THERE is no stronger illustration of the adage that "extremes meet" than the curious revival of an obsolete custom as the latest novelty of the day. As cycles revolve, the old, which had seemed to have gone clean out, comes in fresh and new. Thus it is stated by Mr. Tubbs that at Dewsbury, since 1828, one of the church bells is tolled as for a funeral on Christmas Eve, and this Devil's Knell, as it is designated, signifies that the Devil died when Christ was born. But research would no doubt satisfy the inquirer that the custom is a revival due to some more than ordinarily symbol-loving vicar: and in like manner, in Christmas trees, Christmas boxes, New Year's gifts, and the customs attached to the movable and other feasts of our Calendar, the wider the search, the more curious will the history of each be found to be, if indeed confusion does not result from the rivalry of competing originals. What would a Dewsbury vicar have known in 1828 of Christmas trees, which have got their footing in England since the union of Victoria and Albert? Yet when it is alleged that they are a German custom, referable to the earliest preacher of Christianity among the Germans, and commemorative of the fir-tree under which he slept according to the legend, we are carried back past German Christianity to the Pagan customs of the conquerors of Germany, the legions of Drusus, whose Saturnalia were notable among other features for dolls and puppets slung on mimic pines—the exact pictures, to judge from ancient gems, of a Christmas tree. As for the Christmas boxes, which are perhaps not likely to die out, the volume now before us traces them to Pompeii, where one was found by Aubrey full of denarii, inserted by a slit, as into our missionary-boxes; and there is ground for the supposition that the box in which the gifts were deposited has come to stand for the gifts themselves. Few subjects are fuller of interest than this, and it is a pity that more has not been done till of late years to keep alive the quaint, grotesque, symbolical, poetic usages which in various ways illustrate the social and domestic manners of our forefathers. To one of the most popular repertories on the subject, Hone's *Year Book* and *Every Day Book*, we have more than once directed attention, and the sole drawback to these, as well as to the more modern *Book of Days* of Messrs. Chambers, is that they are, owing to the admission of other matter, too cumbrous and bulky for handy use. The perennial stores of the never-ending *Notes and Queries* furnish fresh material, week by week, for the busy literary bee to hive at leisure. Here, however, we have at last a portable, or comparatively portable, record of the vestiges of old English custom and tradition. Mr. Dyer's book is entitled to praise rather for system and industry than for new light thrown upon old topics; but he has certainly contrived to collect much curious matter, and we have little doubt that, as his book gets into fresh editions, he will see his way to condense it still more by grouping succinctly the similar usages of various counties, though the space saved may still have to be filled up by novel research.

It is not perhaps so much in respect of the upper as the lower strata of society that a record of obsolete customs is most needed. Antiquaries and Court gossips may be trusted to chronicle the manner and measure of royal "New Year's gifts," which seem to have had a knack of coming in rather than going out in the reigns of Henry VII. and Elizabeth. Even the crown-piece under the plate of each chaplain in waiting on New Year's Day has long been given up, and the Laureate of this year of grace has no longer to receive an honorarium for an ode set to music and sung on New Year's morn wherewith to salute the king or the queen. But a vast deal of light upon comparative folklore lurks, no doubt, in such humbler customs as that of the "first foot" on New Year's morn. In the north of England it is ill luck for an inmate to go forth from a house till some one has entered it, and good luck or ill luck for the year depends on whether man or woman enters first. In Lancashire a light-haired man is as unlucky as a woman, and it has become a special calling for dark-favoured men to hire themselves out for liquor and an alms "to take the New Year in." In Worcestershire luck is ensured by laying hands on the first carol singer who presents himself at the front door, leading him through the house, and letting him out at the back. In Scotland "first-footing" used to be a much more complicated affair, involving *hot-pint*—*i.e.* spiced ale and spirits—cakes, short-bread, and what not; to say nothing of a more tender interpretation of the custom, when the first comer by prearrangement met his sweetheart, and obtained the privilege of a kiss as her "first-foot." Another custom of the same season is not quite so widespread, but is said to linger round Bromyard, in the Worcestershire border of Herefordshire. As the hour of midnight is on the strike on the 31st of December, and the last carol is dying away, a promiscuous rush is made to the nearest spring to snatch "the cream of the well," the first pitcherful of the new year, and with it the prospect of the best luck. The same excitement is going on in the dwellings of South Scotland at the same hour, when, as the poet hath it—

> Twall struck—twa neebour hizzies raise
> And liltin gaed a sad gate;
> The flow'r of the well to our house gaes,
> And I'll the bonniest lad get.

The customs connected with the Feast of Epiphany and with Twelfth Day are many and curious; and it is singular how long and widely the name and delicacy of *lambswool* has been associated with its feasting. *Lambswool* in Cumberland forms part of the beverage called *Possoudie*, partaken of on Twelfth-night by the rustics along with Lobscouse—*i.e.* beef and onions and fried potatoes. To judge from Herrick we might take "gentle lambswool" to be a frothy and sweet compound, and certainly it had a great part in the ceremonial of wassailing trees and human beings in Yorkshire, Devonshire, and other counties. But when towards the end of Mr. Dyer's volume we find ourselves keeping Christmas Eve at Nottingham, the lambswool meets us as it did in the first months of the year, but this time with a full explanation:—"Apples are toasted upon a string till they drop into a bowl of hot spiced ale; and this from the softness of the beverage is called Lamb's-wool." With bowls in which this was a prime ingredient, itinerant minstrels would appear on the Eve of Epiphany; and in Staffordshire the star that led the Magi was represented by a lighted hill-fire. Seemingly in connexion with this, though it is not easy to trace the train of ideas, are the customs which Mr. Dyer finds to have prevailed at the same season on the borders of Gloucestershire and Herefordshire. At Pauntley, near Newent, the men of a farm would assemble in a field sown with wheat, and, after making twelve fires of straw in a row, would, standing round one much larger than the rest, drink a glass of cider to the master's health. Then, returning to the farmhouse, they were regaled on cakes soaked in cider. The same ceremony went on on the other side of the boundary line of the counties, with a little more drinking, hallooing, and chorussing round the fires; and at the supper afterwards there was a plum-cake with a hole in the middle, which the bailiff took to the wainhouse. There the master pledged the best ox in a curious toast, and the cake was placed on this ox's horn. If the ox, when tickled, tossed it off backwards, the cake fell to the mistress; if forward, to the bailiff. A kindred recognition of the twelve lights of the world, the Apostles, and the Saviour in their midst, is said to have been customary in Westmeath in the seventeenth century; and so much of the custom as concerns the ox and the health-drinking formula seems also to have been in use at Tretire, near the Wye-side, the ox's toss arbitrating between the boys and the men as to the ownership of the cake. In Pembrokeshire on Twelfth Day a band of men or boys carry about a wren in a gaily-ornamented cage or mimic house, and, accompanying themselves on an instrument, sing "the Song of the Wren" at the doors of the country houses. The wren is their

* *British Popular Customs, Past and Present.* Arranged according to the Calendar of the Year. By the Rev. T. F. Thiselton Dyer, M.A. London: Bell & Sons. 1876.

king, and they are his men; and whilst it would seem that they are nothing loth to pocket the gratuities which reward their services, the probabilities are that the wren figures so conspicuously in the ceremony on the score of the supposed supernatural or angelic nature with which it and the robin are credited in English proverb-lore. The Irish hunting of the wren on St. Stephen's Day is quite another thing, and the custom has for the last thirty years been put down by authority. In the Isle of Man the custom is associated with a rather curious legend, which keeps it from dying out; but such usages as this, and that of hunting owls and squirrels on Christmas Day and St. Andrew's Day, must in time succumb to increasing civilization. The old practice at St. Cuthbert's Church, Ackworth, of suspending a sheaf of corn outside the porch on Christmas Eve for the especial benefit of the birds, is more appropriate to the spirit of the season. Reference has been already made to the rehabilitation of Pagan festivals by the Church of Rome, and we find that Candlemas Day is a case in point. Although generally supposed to commemorate the aged Simeon's taking our Lord in his arms, and calling Him "a light to lighten the Gentiles," it is certain that the old custom of carrying candles at this feast was in honour of Ceres, who had to search for Proserpine, when stolen by "gloomy Dis," with candles or torches. We have Pope Innocent's word for it, that, unable to suppress the custom, the holy Fathers substituted the Blessed Virgin for the heathen goddess in its celebration. At Ripon Cathedral it was customary to illuminate extensively on the Sunday next before Candlemas. In like manner pancakes and cross-buns represent a compromise or a taking-over of Pagan customs; and the perambulation and incantation of orchard trees in Kent during Rogation week (although this is not under the sanction of ecclesiastical authority) is said to be referable to heathen supplication of Æolus, the god of winds, for favourable breezes. The local name is "youling" (p. 207).

Mr. Dyer illustrates St. David's Day with the various surmises which refer the national "leek" to the British Ceres and the Byblian Adonis respectively; and *apropos* of Mid Lent, or Mothering Sunday, discourses of Simnel cakes with more interest than of the day itself, which has a speciality of its own, and was clearly meant by the Church for religious improvement. In the West of England this "Dies Refectionis" is so esteemed by the simple folk. A little more on this point might well be substituted for the stories about Sim and Nell and Lambert Simnel's father—clearly "post hocs," but not "propter hocs." Instead of Simnel cakes, fig pies are eaten on Mid Lent Sunday in Lancashire and Staffordshire; although in several other counties Palm Sunday counts as Fig Sunday, probably on account of our Lord's seeking figs the day before his triumphal entry into Jerusalem. To this latter Sunday is tacked a curious usage at Heutland, a Herefordshire church; priest and people receive from the churchwardens a cake and bun (and formerly a cup of beer), to consume in church, "in token of a desire to forgive and forget all animosities and to prepare for Christmas."

But few probably of those who have eaten hot cross-buns on a score or more of Good Fridays have ever heard of Good Friday bread; it is a small loaf baked on that morning and then put by till the next anniversary of it. Used as a medicine and grated into water, it is supposed to cure diarrhœa and other ailments, and persons must be indeed in a bad way whose complaints resist two doses of Good Friday bread. Among other customs of this day is one still in vogue among the Portuguese and South American sailors in the London docks—namely, that of flogging Judas Iscariot, or a block of wood which is dressed up to represent him. The traitor is finally burnt. One of the most strange and gratuitous flogging customs connected with the Calendar was one said to have attached to Holy Innocents' Day, of "*whipping up* the children upon Innocents' Day morning that the memory of this murther might stick the closer; and, in a moderate proportion, to act the cruelties again in kind" (see p. 498). It is rather hard that the children were not allowed to be flogged in effigy, like Iscariot. There is a touch of poetry in the muffled peals still rung in several churches and at Wells Cathedral on Innocents' Day; and the custom is most refined at Norton, near Evesham, where the bells first rang a muffled peal for the slaughtered innocents, and then unmuffled joy-bells for the deliverance of the Infant Christ (p. 500). There is a great difference in the matter of taste and refinement between some country customs and others. Thus the custom in Lancashire, Salop, Warwick, and North Wales of "lifting" and "heaving," which is something akin to the old-fashioned rolling down Greenwich Hill on Easter Mondays, is said to be traceable to a fancied representation of the Resurrection; and it is hard to believe that up to 1821 a bull was baited annually at Wokingham on St. Thomas's Day under the sanction of the alderman and town clerk, whose perquisite the bull's tongue was considered. On the other hand, there was much picturesqueness in many of these popular customs, as, for instance, when on All Souls' Day, in half-a-dozen counties, young and old would be going "a-souling," *i.e.* begging for "soul-cakes," or in quest of "dole-bread," as in other counties the oaten bread then distributed was called. Such another custom is still kept on St. Thomas's Day, in Herefordshire, where troops of women and children go a-mumping, or a-gooding, or, as they say in Cheshire, "a-Thomasin," or whatever else compounded of "dole," "corn," or such like object, seems best to express their errand.

To the same feeling for the picturesque appealed such customs as well-dressing at Tissington on Ascension Day, and the blessing of wells and springs in Staffordshire, the processions with floral poles and vestments, and the canticle, and pause under the Gospel Oak, at Wolverhampton in Rogation Week (see p. 208), the mummers at Christmas-tide, and the decoration of churches with holly at that season, and with the yew on Good Friday. Another strong appeal was to "magister artis ingenique largitor, venter," as is still recognized in the Christmas hampers, and the good cheer connected with certain festivals in colleges, country houses, and even in a lower range of society. Though it is not now the rule of country houses at Christmas, as it was before the Civil Wars, according to Aubrey, that "the first diet brought to table should be a boar's head with a lemon in his mouth," this solid apparition is still welcomed with musical honours at Queen's, in Oxford, on Christmas Day, in commemoration (as we learn in p. 478) of the gallant student who, having retired to the forest of Shotover for the quieter study of his Aristotle, was incontinently interrupted by a wild boar. With a lively sense of the brute's distaste for ethics, the youth, quick as thought, rammed the precious volume down its yawning jaws, with the choking and convincing formula "Græcum est." Possibly there are students who do not blame the boar for succumbing; it is more to our purpose that the boar's head is not quite obsolete at Christmas.

FRENCH LITERATURE.

HABENT sua fata libelli. Never has this proverb been more strikingly illustrated than in the case of the edition of the turbulent Coadjutor's Memoirs now in course of publication.* M. Feillet was the writer originally engaged to prepare the work for the press, and his thorough acquaintance with the history of the Fronde period particularly qualified him for the task. Two volumes have already appeared, and the promise held forth in them led us to expect a masterpiece of scholarship and careful annotation. Far be it from us to say that M. Jules Gourdault will not carry on to a satisfactory conclusion the task begun by M. Feillet. Indeed the third volume now before us proves quite the reverse; but still we cannot help regretting that the learned author of the book on *La misère au temps de la Fronde* should have been cut off at the early age of forty-eight, especially when we think that his death was hastened by the horrors of the war of the Commune. It seems that the MS. of the concluding volumes of De Retz's Memoirs, ready for the press, was destroyed by fire during the siege of Paris; and thus M. Gourdault has laboured under the signal disadvantage of finishing a work without the materials which his predecessor had assiduously collected. If we bear this circumstance in mind, we shall not grudge M. Gourdault even a double amount of praise. As a matter of fact, this third instalment of the Memoirs is in every respect a worthy continuation of the two previous ones. It takes us to the month of September 1631, and gives by way of appendix the treaty concluded in 1651 between the leaders of the Fronde and the friends of the Royal princes, then detained in captivity at Le Havre.

As we are now treading on classic ground, we may mention the first volume of M. Lemerre's new edition of Molière.† M. Anatole France, who is responsible for this undertaking, promises a life of the poet, a commentary, a selection of various readings, a glossary, &c.; and we have no doubt that all these will be forthcoming in due time. Meanwhile we must be satisfied with the bare text of Molière's first five plays. It is well known that twenty-three of the comedies were printed during the author's lifetime; these *editiones principes*, roughly issued, were full of typographical blunders, and, although they are of course the best source for the settling of the text, yet they require considerable attention on the part of modern editors. M. France has taken them as his guide, and he preserves religiously both the spelling and the punctuation. With respect to the remaining plays the best authority is of course the edition of 1682, issued by the actor La Grange, and by Vinot, who was Molière's particular friend. M. France promises to adhere faithfully to it, and, if the various promises mentioned above are realized, we shall be able to place in our libraries an elegant edition of Molière, of a portable size, beautifully printed, and containing every possible help towards a thorough acquaintance with his works and life. The present volume contains a reproduction of the well-known portrait by Mignard.

We wish that M. Siméon Luce had introduced his first volume of the History of Duguesclin ‡ by something like a preface telling us the plan adopted, the authorities consulted, and the peculiar features which distinguish this monograph from all preceding ones. A passage quoted from Dom Vaissette's *Histoire générale du Languedoc* informs us, indeed, that the biographies of the heroic Constable hitherto published deserve to be classed among romances, rather than amongst trustworthy documents; but beyond this M. Luce gives us no information, and we are left to gather as we go along the nature of the documents he has had at his disposal, and the use he has made of them. We must say at the outset that the splendid edition of Froissart's Chronicles prepared by M. Siméon Luce for the Société de l'Histoire de France raises a strong pre-

* *Mémoires du cardinal de Retz.* Vol. 3. Paris and London: L. Hachette & Co.

† *Les œuvres de Molière.* Avec un commentaire, etc. Publiées par A. France. Vol. 1. Paris: Lemerre.

‡ *Histoire de Bertrand Duguesclin et de son époque.* [illegible] Paris and London: L. Hachette & Co.

sumption of the merits of the work now before us; and it is impossible to read attentively the first few pages without seeing that we are under the guidance of an historian who knows his subject intimately. The first volume takes us as far as the battle of Cocherel. In accordance with the indication given in the title-page, M. Luce describes not only Duguesclin, but the fourteenth century, so far at least as France is concerned; his estimate of the Breton character (Chapter ii.) is very striking, and the whole of the third chapter, devoted to a sketch of private life in France five hundred years ago, is of the highest interest. The *pièces justificatives* fill no less than a hundred and sixty pages of small type.

M. Charles Lenthéric combines the special training of a civil engineer with the gifts of an accomplished writer and the erudition of an archæologist *; and he has applied these qualifications to the discussion of a subject full of historical interest. Scientific explorers who have turned their attention to geological questions are aware that the shore of the Gulf of Lyons is a kind of *Netherlands*, very similar to the coasts of Holland and of some parts of the Adriatic. The old Narbonensis was studded with cities of considerable importance which have now disappeared for ever under the gradual accumulation of sand; in days comparatively recent the limit of the Continent on that side was formed by two lines of coast exactly as is the case now at Venice. A series of lagoons, perpetually fed by the sea, had favoured the establishment and prosperity of harbours, the only surviving one of which is Marseilles. A few centuries hence, says M. Lenthéric, all this zone will probably be fit for cultivation; just now it is wretchedly barren, and the Government has, strangely enough, never thought it worth while to inquire into the possibility of utilizing or improving a very considerable tract of land. The volume before us consists of two parts; in the former, the author examines from a general point of view the variations of the sea-coast, devoting a chapter to the three Mediterranean deltas; in the latter he studies specially the Gulf of Lyons and its principal topographical features. M. Lenthéric's practical conclusions may be summed up as follows:—(1) Transform the French Mediterranean lagoons into a forest by planting pine-trees, maple, &c.; (2) construct a port which shall facilitate the working of the coal beds of the department of the Gard. Aigues-Mortes is, he considers, the best harbour for such purposes, and might easily be restored to its ancient prosperity. The volume is completed by a series of illustrative documents and by fifteen maps or plans beautifully engraved.

We have had lately many French publications treating of the popular songs and poetical traditions of different European countries. M. Alfred Rambaud's interesting collection† devoted to Russian literature is the most recent work of the kind. As in other instances, so in the case of Russia, popular poetry includes two classes of compositions totally distinct from each other. The lyrics are of a religious character, and they present under a Christian garb reminiscences of the original form of heathenism which marked the Slavonic races. These poems are much earlier than the other monuments of Russian folk literature, and the music to which they are sung is extremely ancient; in fact, the same melodies are found on the banks of the Volga and at the furthest end of the Breton peninsula in France. Next to the lyric poems come the epics or historical compositions, the subjects of which are the national heroes and patriotic legends of Russia. This class of compositions alone fills the pages of M. Rambaud's volume. He has divided them into four groups, and analyses the most remarkable amongst them, giving us occasional extracts, and showing how the same myths occur in the literary monuments of countries the most dissimilar in point of climate, civilization, and political sympathies.

The title of M. Jules Levallois's new book ‡ must not lead the reader to suppose that we are now presented with a recently discovered tragedy or comedy of Pierre Corneille. But even the published plays of the author of *Polyeucte* are not much known to the generality of readers, with the exception of the four or five masterpieces which have been reprinted *ad nauseam* and still supply choice extracts to anthologies compiled for the use of schools. M. Levallois acknowledges that such anthologies have their merits, and he does not wish to depreciate them; at the same time he maintains that the study of *Mélite*, *L'illusion comique*, *La galerie du Palais*, and the less popular pieces of Corneille is necessary to a satisfactory knowledge of the poet's character, and we are bound to say that the excursions he has made in those *terræ incognitæ* have produced valuable results. There existed hitherto a kind of Corneillian legend, combining, like all legends, a small proportion of truth with a large amount of error. M. Levallois has fairly demolished it, and his monograph has the merit of drawing our attention to beauties which, on the authority of professors of literature, we had hitherto neglected.

The intellectual life of a nation is intimately connected with its political development. It is absurd to separate two elements which equally contribute towards the accomplishment of a common result; and, further, as the various branches of the human race are closely connected with one another, we may say that the character of any given national literature cannot be thoroughly understood till we have ascertained how it has both influenced its neighbours and been influenced by them in return. Such is the principal idea running through M. Alfred Bougeault's *Histoire des littératures étrangères*, the first volume of which is now before us. When we say that within the compass of a moderate-sized octavo, M. Bougeault studies the literature of Germany, Denmark, Norway, Finland, Sweden, and Lapland, the reader will perceive that he need not expect more than a sketch, illustrated here and there by extracts; the criticisms are in general very fair, and the style is clear and picturesque; but, in spite of his professions, M. Bougeault neglects those comparisons with the literary masterpieces of other countries which would bring out the peculiarities of German poetry, philosophy, and criticism. His work, therefore, falls short of the ideal conception drawn in the preface.

M. Gustave Hubbard's programme fails likewise in this respect; although it proclaims somewhat pompously and pretentiously the "Synthesis of European Civilization." † We readily admit, however, that no author can succeed in giving in four hundred duodecimo pages both a "synthetic" history of any literature and a critical sketch of its principal writers. M. Hubbard's volume forms part of a collection which we have already had occasion to notice; it is intended to deal with contemporary literature; but the author has judiciously prefixed an introductory chapter on the beginnings of Spanish literature, and his interesting sketches of the old romances, the poem of the Cid, Cervantes, the drama in its various manifestations, and the *picaresque* style of composition, enable us to understand the intellectual progress of the present day. The work itself is subdivided into three books corresponding with the three following epochs—(1) from the Revolution of 1808 to the death of Ferdinand VII.; (2) from the first civil war of seven years to Espartero's Regency; (3) from the accession of Queen Isabella II. to the revolution of September 1875. This last book is preceded by an excellent description of the general character of the epoch under consideration.

The last four instalments of M. Franck's *Dictionnaire des sciences philosophiques* † have brought to a conclusion one of the most useful amongst the series of lexicons published by Messrs. Hachette. The theoretical articles remain the same, or nearly the same, as in the former editions, but the biographical notices have been much modified, and the names are added of eminent philosophers who have died since 1847, such as Rosmini-Serbati, Saisset, Lamennais, Schopenhauer, and others. Certain essays of a purely scientific kind likewise appear, with important alterations and additions.

Under the title *Voyage au pays de Babel* §, M. Félix Julien has written an excellent summary of the progress made by Assyriologists and, generally speaking, by Oriental scholars. The discoveries made by the late M. Eugène Burnouf, his commentary on the Yaçna, and his investigations of the old Zend literature, are well explained; and the relations between the Semitic and Turanian races are described in a manner which shows that the author has carefully studied the subject. M. Julien has a wholesome dread of hypothetical theories, and of conclusions adopted *à priori* in support of a religious or philological crotchet; accordingly, he handles M. Renan with much severity, and contends that the famous *Histoire des langues sémitiques*, whilst possessing all the attractiveness of a novel, has no other merit whatever. The supposed monotheism of the Semitic race is another fancy disposed of by our author, who reproduces some of the facts given many years ago by the late Professor Munk in his inaugural address at the Collége de France.

M. Caro is one of the chief contributors to M. Franck's Dictionary of Metaphysical Science, and has also published a number of well-known works on that wide subject. He may be considered a leading champion on the side of spiritualism, as opposed to sensationalism and materialism. The volume he has lately brought out ‖, consisting of articles originally written for the *Revue des Deux Mondes*, is another manifesto on behalf of metaphysics; its aim is to show that metaphysics are a reality, that the inductive sciences are not sufficient to explain man's destiny even in this world, and that the Positivists have as yet signally failed in their efforts to prove that they alone can regenerate society. Perhaps the most extraordinary symptom of the revolution which is just now taking place in the intellectual world is the strange want of logic manifested both by the leaders and the followers of the materialist school. M. Caro remarks that, notwithstanding their contempt for data which are not the results of experience, M. Littré and writers of his school are constantly compelled to appeal to such data, and are reasonable only when they do so; he further shows that from their hatred of Christianity and priestcraft, the theorizing Republicans of the Rousseau school, the champions of the rights of man, the apostles of equality and fraternity, claim as allies men whose doctrines rest on an essentially aristocratic and exclusive principle. The applications of modern materialism to natural law, to the right of punishing, and to the status of the criminal classes, are amongst the chief topics discussed by M. Caro.

We cannot be expected to wade through the bulky volume of M. Emile de Girardin*; nor would it be a very easy task to find a really striking page in a collection of newspaper articles which have not the slightest interest now, however pointed and pungent they may have been a year ago. France is a prey, we are told, to the spirit of faction. The *intransigentes*, the *irréconciliables*, are to be found in equal proportions amongst the Republicans, the Bonapartists, and the Monarchists. All seek the triumph of their opinions rather than the happiness of the country, and the war of 1870, instead of putting an end to intestine quarrels, has only complicated them a thousandfold. M. Emile de Girardin's theory is right enough, and his horror of red-tapeism has our cordial sympathy; but we do not believe that universal suffrage is the panacea which will save France from destruction. If we felt disposed to call to our assistance an able and experienced legislator, it would certainly not be the philosopher who, jealous, no doubt, of M. Proudhon's laurels, asserts that good and evil have no real existence, and that law and justice must give way for a kind of insurance company organized by mankind against the risks to which society is exposed.

M. Roget's history of Geneva† appears in small *fasciculi* according to a principle which we cannot understand; thus the work has a disjointed look, and the reader is obliged to wait a considerable time for a couple of hundred pages, instead of sitting down at once to the perusal of a reasonable-sized volume. This is a pity; for M. Roget writes well, his narrative is compiled from authentic documents, and he is specially to be commended for his impartiality. The events related in the present *livraison* are the trial of Bolsec, the differences of the Genevese and the King of France, the early symptoms of resistance against Calvin's despotism, and the measures of surveillance adopted with respect to refugees from France, Italy, and other neighbouring countries. It was evident, in the first place, that, if Geneva opened its gates indiscriminately to all persons persecuted on account of their religious views, the natural consequence would be a rupture with the King of France and with the Catholic potentates of Northern Italy; in the second place, it might be taken for granted that the multitude of refugees included, not only Evangelical Protestants, but free-thinkers and philosophers, through whose influence Calvin's authority would be endangered and Puritanism defeated. M. Roget's new pamphlet illustrates this state of things very fully, chiefly by an account of Bolsec's trial, and of the discussions between Calvin and the other ministers on the subject of predestination.

The *Public School French Grammar* which we have received from Messrs. Hachette‡ is an adapted translation of M. Brachet's well-known work. We need scarcely say that a grammatical treatise originally composed for French pupils required considerable additions and alterations to make it useful in English schools. The changes needed for this purpose have been made; and a distinct volume to be shortly published will contain the syntactic part of the work, more fully and thoroughly discussed than it is in the book before us. We have noticed a few typographical blunders which ought to be corrected in a future edition.

The list of works of fiction for this month includes reprints of several well-known tales. We have, first, M. Alfred de Musset's *Confession d'un enfant du siècle*§, which is really an autobiography slightly modified by the author's imagination. Published forty years ago, it immediately obtained notice on account both of the beauty of the style and of the tone of scepticism *désillusionné* which pervades it from beginning to end. M. de Musset's early poems, forming a companion volume in the same collection, are expressions of a similar mode of thought‖, and when they appeared they suggested a parallel with Byron. Both volumes are printed in a pocket form, and illustrated with etchings; they are to be followed by other works. M. Charpentier has also published a new edition of the tales composed by MM. E. and J. de Goncourt. Here we find realism of the most disagreeable kind, without the beauty of expression which gave such popularity to the *Confession*.¶

The best novels now before us are borrowed from foreign sources. Under the title *La princesse Morani* ** M. Louis Ulbach has arranged one of Mme. von Taalzow's historical tales, which introduces us to the Court of Vienna during the reign of Maria Theresa. The *Major Frans* ††, translated from the Dutch by M. Albert Réville, is a clever sketch of contemporary life in Holland.

The second part of M. de Montalembert's famous essay on Spain gives special interest to the February number of the *Bibliothèque universelle* ‡‡; and other articles are worth reading, especially the one in which M. Louis Léger exposes M. Verkovitch's attempt to connect the literature of the Slavonic race with the Vedas of Hinduism.

We must not conclude without mentioning the splendid edition of the book of Ruth, illustrated with M. Bida's usual talent.* The etchings, taken from personal observation and close study of Eastern life, are masterpieces.

THE ROYAL TITLE.

WHATEVER may be the opinion generally entertained as to the propriety of the title which the QUEEN is to be advised to assume, there can be very little difference of judgment as to the manner in which Mr. DISRAELI has managed the business of bringing the subject before Parliament. He has been mysterious about nothing, and has demeaned himself as if he were in some high and delicate atmosphere of prerogative which his humble lungs were hardly able to breathe. There is no question of prerogative at all. The QUEEN cannot take a new title, or make any alteration in her title, except under an Act of Parliament. The reason is that the title of the Sovereign is of importance to the nation as well as to the QUEEN. As it is of this importance, Parliament must be informed of the title which it is proposed she should take. Mr. DISRAELI on Thursday night explained his refusal to disclose the title previously by saying that he thought the best time to disclose it was on the occasion of the motion for a second reading. This may be convenient to the House or not, but there is nothing grand or mysterious about it. It is a mere detail of Parliamentary procedure. Before the Bill could make any serious progress the Government had to state that it had made up its mind that the addition to the Royal title should not refer to the Colonies, that it should refer to India as a whole, and that the title should be Empress. For the exclusion of the Colonies from recognition in the new title, Mr. DISRAELI gave on Thursday the worst possible reason that he could have discovered. On the introduction of the Bill he gave a much better one. He then said that the Colonies were really included, and liked to be thought included, in the United Kingdom. Colonists were merely Englishmen living in a different part of the world. The objection to this view was that, if this were so, to treat India as not included in the United Kingdom was to stamp it with inferiority, and to mark off a harsh division between the QUEEN'S subjects. But at any rate the reason, such as it was, seemed complimentary to the colonists. They were above needing any mark of recognition. But on Thursday Mr. DISRAELI quite changed his ground. It is not colonists generally, but a few rich colonists who return to England, that occupy his attention. Gentlemen who pick up nuggets, or fleece thousands of sheep, hurry to England, take grand houses, buy estates, are presented at Court, and so have as much to do with the QUEEN as they could wish. It is through the lucky adventurers who give up the Colonies and spend their money in England that the close tie between the QUEEN and her Colonies is preserved. Colonial loyalty is to be discovered in a South Kensington palace, not in the attachment to the Crown of vast new nations spreading the English name over the world. It is not of Canada or the Dominion, but of the Canadians who do not think Canada good enough for them, that the QUEEN is supposed to think with pride when she contemplates her titles on her coins. It is true that the colonists are quite satisfied with things as they are, particularly as it has not perhaps hitherto occurred to them that the only people among them worthy of the QUEEN'S notice are those who will have nothing more to do with them. In any case they must be very well pleased to be left out, if the new title is to be that of Empress. No Englishmen in any part of the world want to exchange the [illegible] of their QUEEN for the Brummagem dignity of an Empress. Even if they are humble enough to be content to stay in the place of their birth or adoption, they are proud enough to reject the thought that their Sovereign would be more to them if she was decked out with the frippery of a grander name.

The main reason alleged for advising the QUEEN to assume a title with special reference to India is that the natives of India are said to be burning with a wild desire to see the QUEEN invested with this new dignity. The proofs of this desire furnished by the Government are of the feeblest description. Sir STAFFORD NORTHCOTE, who is by no means without just notions of the meaning of evidence, must have felt himself at his wit's end for something like a proof, when, as a sign of the wishes of India, he adduced a letter written, not by a native, but by an Englishman, and not to a native, but to a person in Central Asia, in which the writer had, as a kind of imposing flourish, called the QUEEN Empress of Hindostan. A non-existent title, referring to a non-existent State, bestowed gratis by an Englishman in corresponding with a foreigner, is the quaintest indication of the wishes of the natives of India that a Minister could have imagined. But, although it may be difficult or impossible to prove that the natives wish for a special Royal title referring to them, it may be quite true that such a wish exists, and that it would be wise as a matter of sentiment, and prudent for many political purposes, to gratify this wish. Sir GEORGE CAMPBELL, who knows India well, is of this opinion, and no one of Indian experience and position controverted it. Mr. GLADSTONE pointed out that the QUEEN is technically only Queen of the portions of India belonging to the East India Company transferred to her, and that a title claiming supremacy over all India is an innovation. But it is an innovation expressing a fact. The chiefs who are called independent in India are not really independent. It would be hard to state precisely and with legal accuracy what is the nature of the supremacy to which they are subjected. But such a supremacy exists, and a title is a good mode of recording this supremacy without defining it. In India itself the new title will, according to Sir GEORGE CAMPBELL, be Padishah, the highest title of sovereignty, whatever may be the English rendering; and what the people of India wish, what the chiefs are ready to recognize, and what the experience of competent Englishmen acquainted with India would approve, is that the QUEEN should in India be called Padishah. It is a matter of regret that the question has not been treated, as it might very easily have been, as a purely Indian one. If Parliament had simply been asked to enact that the QUEEN'S title in India should be Padishah, that all official documents and Indian coins should be made in accordance with this title, and that the Sovereign or her children when in India, and the Viceroy as representing her, should for all Indian purposes be treated as a Padishah, or as the descendants or representatives of a Padishah, the natives would have got all they would have wished, the colonists would have had nothing to do with the business, and we in England should not have been troubled with the discussion whether the QUEEN was to be an Empress.

But the Government has decided that the QUEEN is to be an Empress. She is in England, in Europe, everywhere, to have an Imperial as well as a Royal dignity. If Englishmen are asked whether they like this, every one must, since it is a pure question of feeling, answer for himself; and all we can say is that we do not like it at all. No doubt "Empress" is an English word, as Mr. DISRAELI went very much out of his way to prove. We habitually speak of the

British Empire, and the Imperial dignity of the Crown is a phrase recognized in an Act of Parliament. SPENSER wrote a dedication in which he called ELIZABETH an Empress; and, as Mr. DISRAELI argued, SPENSER knew courtiers, and perhaps they approved of the word, and the courtiers had access to the QUEEN, and perhaps they mentioned the dedication to the QUEEN before it was published and obtained her approval. It is equally possible that none of this happened, but there is nothing improbable in the notion of ELIZABETH being tickled with any piece of personal flattery. But arguments like these have nothing to do with the question whether now Parliament should authorize the QUEEN to call herself Empress. We must take the term as it stands now, with its present meaning and its present historical associations. These associations are to English minds unpleasant ones. There have of course been good Emperors and bad Emperors. There have been the ANTONINES, and there have been NERO and DOMITIAN. There have been ALEXANDERS and PAULS. The Emperor originally held, as Mr. GLADSTONE said, an elective military office; and so far the title is very inappropriate to the QUEEN; but it must be allowed that modern usage has changed the meaning of the term. But if this modern usage is to tell, it must also bring with it its own associations, and especially those of the French Second Empire, and we prefer our QUEEN not imitating the NAPOLEONS. Then, again, Emperor is generally thought to be a grander title than King. Technically speaking, this is not recognized in diplomatic circles. The representative of the Emperor of RUSSIA has no precedence over the representative of the King of SWEDEN. But, popularly speaking—and in a matter of popular sentiment we must attend to popular usage—an Emperor is thought to be somebody grander than a King. The old story of the meeting of the Sovereigns to pay their court to NAPOLEON, when a visitor hung about unnoticed and a lackey explained that it was "only a "King," comes naturally into the memory. In England we are proud of not sharing the feelings of the lackey. We like to think that our Sovereign is "only a Queen." It is the simplicity of greatness that accords with our tastes, and the feeling prompts itself that Mr DISRAELI is inclined to regard the matter too much from the lackey point of view, and to find a pleasure in shouting out a sonorous title which his countrymen who have less taste for pageants and ceremonials do not share.

INCIDENTS OF THE SUEZ CANAL DISCUSSION.

MR. GLADSTONE and Mr. LOWE have already received some compensation for the mortifying failure of their attack on the Suez Canal purchase. The measure was wise, but there has been great mismanagement in some of the subsidiary arrangements, and Mr. DISRAELI has in incidental discussions betrayed a want of his usual tact and temper. A Minister who seldom troubles himself to master details is at a disadvantage in meeting criticism on the acts of the Government, but long practice has taught Mr. DISRAELI to rely too confidently on his own adroitness and on his just influence in the House of Commons. He has now been misled by an easy victory over his opponents in the principal debate on the Suez purchase. The House was not inclined to adopt Mr. GLADSTONE's objections to the mode in which the money had been borrowed, because the main issue to be considered was whether it had been judicious to acquire an interest in the undertaking. Mr. LOWE played into the hands of the Government by his unseasonable reference to his own skill in providing for the payment of the *Alabama* damages. Having once for all affirmed the soundness of the Ministerial policy, the House of Commons is now at leisure to consider the terms on which the purchase money was advanced. It may perhaps have been, as Sir STAFFORD NORTHCOTE contended, difficult or impossible to obtain at a moment's notice the whole amount from the Bank of England; but the payments to the KHEDIVE were likely to be spread over several weeks, and there was therefore time to arrange for the advance of the later instalments on favourable terms. The Government may perhaps have had good reasons for not publishing the transaction as soon as the bargain was closed, so as to prevent the speculation in shares which followed the disclosure of the secret in Egypt; but no explanation of the temporary maintenance of secrecy has been given to Parliament. The subject will recur as often as Mr. GLADSTONE finds an opportunity of reasserting his own opinion and of throwing discredit on the Government. Mr. DISRAELI would be well advised in entrusting to the CHANCELLOR of the EXCHEQUER the duty of repelling attacks. Not being a match for his ancient rival and adversary in discussions on finance and business, he may prudently reserve himself for occasions on which Mr. GLADSTONE's eagerness may give an opening for retaliatory criticism. Expressions of ironical satisfaction at every fresh illustration of the relations of the Government to the Suez Canal Company will soon pall on the taste of the House. The pleasure which a political opponent feels in every discomfiture of the Government is not universally shared when the country suffers through the alleged error of the Ministers.

One unqualified blunder of the Government has been aggravated by a display of irritable obstinacy which is not ordinarily characteristic of Mr. DISRAELI. In 1871 proposals for a change in the ownership of the Suez Canal had been suggested in several quarters. The KHEDIVE had expressed to Colonel STANTON, then Consul-General in Egypt, an opinion in favour of the transfer of the property either to an English Company or to the English Government. The Italian Government about the same time suggested the joint acquisition of the Canal by the maritime States. The Commune then occupied Paris; the war with Germany had recently ended; and it seemed doubtful whether M. DE LESSEPS could induce his shareholders to provide funds which were urgently required. Sir DANIEL LANGE, agent or representative of the Company in England, thought that, in the interest of all parties, the English Government ought to purchase the property; and he communicated his opinion both to M. DE LESSEPS and to Lord GRANVILLE, who was then Foreign Secretary. M. DE LESSEPS at first expressed strong repugnance to the proposal; but on reconsideration he intimated a disposition to negotiate a sale to the maritime Powers. Sir D. LANGE, with sound judgment, adhered to the scheme of exclusive English ownership and management; and the Turkish Ambassador in London devised the project of an ostensible sale to Turkey, which was then to transfer the property to England. The Turkish Government refused to countenance a sale to an International Commission; and it is not clear whether it would have acquiesced in English ownership. The correspondence ended with a formal refusal on the part of Lord GRANVILLE to engage in the transaction. Sir D. LANGE must have formed an erroneous estimate of Mr. GLADSTONE's policy when he proposed to his Government a bold and costly enterprise. Although he had himself held the same language to M. DE LESSEPS and to Lord GRANVILLE, he had not communicated to his official superior the overtures which he had made to the English Government. Some of his letters to Lord GRANVILLE had been marked "private and confidential," and the whole correspondence was of the same nature, and was entitled to the same protection. When Mr. DISRAELI declares that two of the most important letters were sent without the proper heading, he makes an excuse which is at the same time frivolous and inaccurate. All Sir D. LANGE's letters are important; and the publication of those which were not marked "private and confidential" would have had the same effect with the publication of the whole correspondence.

As soon as Sir D. LANGE's letters appeared in the Appendix to the Suez Canal papers, he was summarily dismissed by M. DE LESSEPS from the service of the Company. It is useless to inquire whether M. DE LESSEPS was morally justified in an act which he had evidently power to perform; but it may be admitted that there were expressions in the letters which might naturally cause offence; nor was it unnatural that the President of the Company should resent the independent proceedings of an agent. On the other hand, there is no doubt of the loyalty of Sir D. LANGE, who urged on M. DE LESSEPS the same policy which he recommended to the English Government. The penalty which his frankness has incurred sufficiently proves the futility of attempts to show that some or all of his letters were not private and confidential. Any person who incurs risk of loss or inconvenience when he furnishes information to Government is strictly entitled to the protection of secrecy. In one of his hasty explanations Mr. DISRAELI observed that the letters were addressed, not to the present Foreign Minister, but to his predecessor. He also seemed to wish to devolve some of the responsibility of publication on Lord GRANVILLE, to whom the letters had been sent in accordance, as it seems, with the usual custom. The office of Foreign Minister is permanent and identical

through all changes of incumbency. The confidential character of communications to the Foreign Secretary would be worth little if his successor were relieved from all obligation of confidence. Lord DERBY, who has not succeeded better than Mr. DISRAELI in defending his conduct, admits that he is exclusively responsible for the publication. Lord GRANVILLE'S share in the business ended with the letters in which he refused to negotiate for the purchase of the Canal. Mr. DISRAELI has more than once refused to avail himself of the excuse that the publication of the letters resulted from inadvertence; and though Mr. GLADSTONE still professes to think that an oversight had been committed, Mr. DISRAELI is right in asserting that the blunder of the Government was perfectly deliberate. Lord TENTERDEN, in his able and lucid summary of the history of the Canal, inserts in the proper places abridgments of Sir D. LANGE'S letters. The Under Secretary must be supposed to have called Lord DERBY'S attention to the confidential nature of the communication; and Lord DERBY deliberately justifies the publication of the letters on the ground that Parliament was entitled to information as to the overtures made in 1871. It is true that in many cases the confidential character of a communication is removed by lapse of time; but the interval in this case has not been sufficient to relieve Sir D. LANGE from the consequences of his correspondence with the English Government. Mr. DISRAELI'S disclaimer of carelessness is sustained at the cost of incurring a graver charge. There has been inadvertence and oversight, in the sense, not of neglect, but of deliberate misconception of duty.

The ill wind which blows on the Government brings good to Mr. GLADSTONE. His sneers are even pointed by a reference to the hardships and claims of Sir D. LANGE which might almost imply a willingness to compensate him at the public expense for the loss of his place. It is difficult to believe that Mr. GLADSTONE would pay such a price even for the pleasure of inferring from the proceeding of M. DE LESSEPS that the English Government has secured no influence over the policy of the Canal Company. On this point Lord DERBY can afford to bear Mr. GLADSTONE'S sarcasms with equanimity. It is still true that the possession of nearly half the capital must confer influence on the holder, although the effect may not be direct or immediate. M. DE LESSEPS is master of the administration, and he can dismiss his subordinates at pleasure; but M. DE LESSEPS, though he is fortunately active and vigorous, is not immortal, and English influence will be felt in the selection of his successor. In the meantime the most formidable of M. DE LESSEPS'S claims to the support of the French Government has been greatly and permanently weakened by the English purchase. But for the prompt action of the Government the entire enterprise would by this time have become French, probably with the ulterior consequence of absorption by the State. M. DE LESSEPS has never been wanting in self-assertion, which might by his enemies be deemed to border on arrogance. It is probable that a collateral motive for dismissing Sir D. LANGE was a desire to inflict a slight on the English Government; but even M. DE LESSEPS can forget his jealousy when anything is to be gained by co-operation. The modified tariff which has been provisionally settled with Colonel STANTON may probably promote a feeling of greater cordiality. Mr. DISRAELI'S angry explanations would be more effective if he understood better the strength and weakness of his position. It is not only in discussions on the Suez purchase that he is unfortunate in his exposition of his Egyptian policy. The refusal of the Government to sanction the establishment of the proposed Bank by the appointment of a Commissioner was generally approved; and it was unnecessary to add that a more ambitious and more questionable mode of interference might perhaps be adopted. It is highly probable that no measure of the kind is really contemplated; and that Mr. GLADSTONE'S argumentative indignation was only applicable to an offhand notion which had crossed Mr. DISRAELI'S mind.

THE OXFORD UNIVERSITY BILL.

THE debate in the House of Lords on the University of Oxford Bill showed that a few members even of that assembly hesitate to abolish one of the most distinctive of English institutions. Lord COLCHESTER received no support for his amendment, but several speakers intimated disapproval of the measure which nevertheless they allow to pass without opposition. It is possible that in the House of Commons Lord SALISBURY'S tenderness for clerical endowments may provoke more objection than his sweeping abolition of lay fellowships. About twelve peers submitted to the hardship of being late for dinner, while the mover of the Bill repeated again and again, as if in answer to a challenge, the sneering epithet of "idle" fellowships. Lord CARNARVON contended that the claims of the University were prior to the rights of candidates who have hitherto had a prospect of valuable prizes. It is a new and strange doctrine that all corporate property is at all times subject to the absolute disposal of Parliament. A generation may arise in which the House of Lords, if the House of Lords shall have survived so long, may think some other object more beneficial than the learning and research which are, by some undefined process, to absorb endowments of 100,000*l.* a year. When that time comes, Lord SALISBURY and his colleagues will have established a precedent for disendowment which will admit of adoption and of extension. The Archbishop of CANTERBURY, who is only anxious that legislation on the Universities should come to an end, might have been expected to foresee that disestablishment will be facilitated by arbitrary redistribution. If Lord CARNARVON'S principle is sound, the argument against Church endowment will be conclusive, as soon as Parliament may hold that any other application of ecclesiastical property would be more beneficial to the community.

Lord SALISBURY laid stress on the expediency of allowing the Universities or the Colleges to legislate for themselves; and he has probably ascertained that the majority of the resident body concurs in his general policy; yet the Bill allows the Colleges only a discretion of the same kind with that which is exercised by a Dean and Chapter on receipt of a *congé d'élire*. Up to the end of 1877 the Colleges may anticipate the action of the Commissioners; but their proceedings are subject to the veto of the Commission. From the beginning of 1878 the Commissioners may regard the whole property of the Colleges, with the curious exception of the emoluments of Heads of Colleges, as a fund to be distributed at their discretion. Each College, as its turn comes, may appoint three Commissioners of its own, who will be always in a minority, though, as they will be practically elected by the resident body, they will probably concur in schemes of redistribution. At the close of the proceedings the Privy Council will give the Report the force of law, after hearing any objections which may be urged by persons or bodies directly affected. None of those who are to suffer will be directly affected, nor will the actual Fellows of Colleges have a right to oppose the scheme, inasmuch as their vested interests are protected. The best illustration of the extraordinary powers which the Government propose to confer on themselves is furnished by Lord SALISBURY'S opening speech. There is not a word in the Bill about the suppression of sinecure fellowships; and yet Lord SALISBURY candidly avowed that the transfer of endowments to the amount of many thousands a year was the principal object of the Bill. It follows that Commissioners will be appointed who will exercise apparently arbitrary powers, in accordance not with the words of the Bill, which may be supposed, if it is carried, to express the intentions of Parliament, but with the Minister's speech, which expresses the intentions of the Government. It is worth while to observe that none of the speakers who objected to the large powers of the Commissioners noticed the strange contrast between Lord SALISBURY'S statement and the Bill. It is indeed possible that he may himself have rated too highly the control which the present Government will exercise over their nominees. In the course of seven years there will be changes in the Commission itself, and it is possible that by that time a majority may have received their instructions from a Liberal Government. The disclosure of the opinions of the Commissioners before they have been appointed sufficiently proves that they will be pledged to execute Lord SALISBURY'S scheme of abolishing sinecure fellowships. It is apparently useless to ask for hesitation or delay. Mr. LYULPH STANLEY, who has a carefully considered scheme of his own, practically adopts the fundamental assumption of the Government. If the funds of the Colleges and Universities are absolutely at the disposal of Parliament, long-continued usage of course creates no presumption in favour of any existing system.

Those peers who criticized Lord SALISBURY'S plan nevertheless, with the exception of Lord COLCHESTER, acquiesced in the appointment of a Commission of unlimited powers

which will beforehand have accepted Lord SALISBURY's scheme. Some of them expressed a hope that fellowships would only be limited in the term of occupation; but Lord SALISBURY absolutely refused the smallest concession. As a general rule, the tenure of fellowships ought to be temporary, and not excessive in duration. At Cambridge lay fellowships tenable for life are few in number, and the possible and occasional life tenancy is further limited in practice by non-fulfilment of the statutory conditions. The great majority of professional laymen marry as soon as they can afford to maintain a family; and in most Colleges fellowships become vacant when the holder possesses a certain amount of property. Up to the present time clerical Fellows retire on acceptance of College livings or of other benefices; and many of them have up to that time been engaged in the discharge of academic duties. If it is thought desirable to diminish still further the number of life fellowships, the increase in the number of prizes will counterbalance a certain reduction of value. In any case a power of prolonging the tenure of fellowships in particular cases ought to be vested in some competent authority. If the principle of maintaining sinecure fellowships were conceded, it would probably not be difficult to agree on some reasonable compromise. It is true that, as Lord SALISBURY said, professional prizes are given in the form of higher and perhaps more laborious employment; but the object of College prizes is to stimulate the exertions of University students; and while those who are destined for an academic career may properly conform to the analogy of other professions, the condition of residence at the University would exclude the great body of competitors from all share in the endowments. The fellowships would consequently not serve their present purpose as prizes; and a limited competition would scarcely maintain the actual standard of eminence. In practice sinecure fellowships have served the double purpose of promoting the highest education, and of enabling a small and meritorious class to enter life with advantages which are ordinarily obtained only by the fortune of birth. It is at least doubtful whether any direct addition to the machinery of teaching would be an equivalent for the abolition of a powerful motive for learning.

It would be absurd to deny that the German Universities, which dispose of no sinecures, excel Oxford and Cambridge in the production of prodigies of attainment, and probably in the average diligence of the students; but, if German graduates have no fellowships, they enjoy many exclusive privileges. A University education is the indispensable condition of civil employment by the State, and it is accepted as a substitute for a part of the term of compulsory service in the army. One of Prince BISMARCK's strongest measures in his contest with the Roman Catholic clergy is the law which compels candidates for the priesthood to receive an education in a secular University. It would be impossible to practise similar compulsion in England. It is always probable that a national institution suits the character and circumstances of the community in which it exists. An imitation of the University system of Germany would probably fail in England. Lord SALISBURY's remark that nobody would now think of establishing sinecure fellowships for the first time would apply with equal force to higher dignities and more important forms of possession. The numerous States which have in modern times invented constitutions for themselves have, with the exception of the Monarchy of France at the Restoration, never succeeded in creating an hereditary Upper Chamber; and yet there is reason to believe that the English House of Lords is the happiest of accidents. The presumption in favour of that which exists is of course liable to be rebutted; but, in discriminating between a living and useful institution and an obsolete form, the true test is the modern improvement or deterioration of results. Within living memory the qualifications of Fellows and the beneficial influence of fellowships have been constantly raised and augmented.

THE NEW FRENCH MINISTRY.

M. DUFAURE was not able to meet the new Chambers with a Ministry, and the impression of his being behind time which this fact suggested is strengthened by the composition of the Cabinet which has now been formed. It would have been a very proper Ministry in the days of the old Assembly. Four of M. BUFFET's former colleagues would have been held to give it solidity, while four recruits from the Left Centre, including M. CHRISTOPHLE, would have imparted to it that dash of moderate Liberalism which was all that the Assembly wanted to satisfy its political aspirations, and which, if the Conservatives had been wise in time, might have equally satisfied the new Chambers. The Conservatives were not wise in time, and consequently the Liberalism of the new Chambers is of a more decided colour; and it remains to be seen whether the majority will not soon display a natural, if not reasonable desire, to have a Ministry as decided as themselves. M. DUFAURE has before now been almost as obnoxious to the Left as M. BUFFET himself; and though he may be a different man in presence of a Liberal majority from what he was in presence of a Conservative majority, he is neither young enough nor pliable enough to take very readily to new ways. No man in either Chamber has a greater power of saying stinging things, and in the Assembly this faculty was always called into exercise by some offence given by the Left. If M. DUFAURE intends to throw the same incisive speeches at the Liberal majority which he occasionally threw at the Liberal minority, he will find it hard to retain power on anything like Parliamentary conditions. M. LÉON SAY ought to have some skill in smoothing down Cabinet quarrels, if the gift can be gained by practice; for from the day he entered the late Ministry to the day that the Ministry came to an end, hardly a week passed without rumours that he was about to resign and assurances that he had made things straight again. What part he will play in a Cabinet in which his opinions will presumably be of more weight than they were in the last it is impossible to say. He has considerable reputation in finance; but financial skill and Parliamentary strategy do not always go together. The Duke DECAZES has been a very popular Foreign Minister, and his presence would have been essential to the success of almost any Cabinet as a guarantee of the continuity of French foreign policy. He was elected for an arrondissement of Paris in the second ballot by the aid of M. GAMBETTA, and it has not yet been ascertained at what point his devotion to the duties of his special department will be overcome by his distrust of Radicalism. General DE CISSEY is believed to have no politics. He is a soldier, and as such his first duty is to obey orders. Nominally, of course, he is M. DUFAURE's colleague; really he is Marshal MACMAHON's deputy. He too, however, has a special function as regards foreign Powers, inasmuch as he is associated with that exceedingly gradual reorganization of the French army which has perhaps done as much as the Duke DECAZES's tact to convince Germany that she has nothing to fear on the side of France.

These make the contingent which M. BUFFET's Cabinet has bequeathed to its successor. The best known of the new names is that of M. CHRISTOPHLE. As a former President of the Left Centre he would once have been a great power in the Cabinet, but it is difficult to predict what place the Left Centre will occupy in the new Legislature. According to some observers, they have not lost as much ground in the elections as is generally supposed. According to others, the group, as it has hitherto been known, is virtually annihilated, and, if a Left Centre continues to exist, it will not be the Left Centre with which we have so long been familiar. It is quite possible that the policy of the Conservatives in dissociating themselves from the Left so completely as they did may prove to have greatly injured the Left Centre in the elections. It used to be said that France was Left Centre, and in so far as this meant that the type of Republicanism advocated by the Left Centre was the type which in 1873 would have been popular with the constituencies, the statement was probably true. But the credit of the Left Centre depended as much perhaps on their supposed power to convince the Conservatives that a Republican Government was inevitable as on their supposed discernment in making that discovery for themselves, and when their influence over the Conservatives turned out to be very slight, the electors may insensibly have learned to look to a stronger variety of Republicanism as a better foundation for a permanent Government. It is curious that, though the elections are over and the results known, we should still be speaking in this uncertain strain. But the real character of a newly elected Legislature has seldom been so completely a matter of conjecture as in the case of the new French Chambers. There is so large a proportion of new names among the deputies, and so much ignorance exists as to the precise relation between the professions of

the candidates during the canvass and their future action in divisions, that, beyond the fact that France is decisively Republican, nothing can be said to be placed beyond doubt. M. RICARD, the new Minister of the Interior, is the only member of the Cabinet who as yet has a seat in neither Chamber. The elections have proved that this office is not so important as it used to be considered in the days when the peasants voted at the bidding of the local authorities, and the majority of the returns were arranged in the Minister's bureau. But the Minister of the Interior has so much power over the press and over the many incidents which bring Frenchmen into contact with the Administration, that the popularity of a Cabinet depends on him in a greater degree than upon the Prime Minister himself. If M. BUFFET had not united the two offices in his own person, he would have been very much less hated than he succeeded in making himself. M. RICARD will have it in his power greatly to soften the impression of unbending rigidity which M. DUFAURE'S presence at the head of affairs will be calculated to create. M. WADDINGTON has the recommendation of having been a Minister under M. THIERS and a colleague of M. CASIMIR PÉRIER. The most important thing about the appointment is that he is a Protestant, and that the nomination of a Protestant to the Ministry of Education may be taken as an indication that the new Cabinet will not be specially clerical in its policy. As regards the actual administration of the department, there is no reason why a Protestant should not show as much consideration to all the reasonable claims of the clergy as a Roman Catholic. But when it is remembered that to be a Protestant in France is at least as great a drawback to political success as to be a Catholic is in England, it is a strong step to put M. WADDINGTON in the office which of all others, except that of Public Worship, brings the holder into contact with the Church. It is possible that this appointment may prove the most prudent that M. DUFAURE has made. There is no great danger that the clergy will quarrel with the Ministry, because they must be very well aware that in the present condition of affairs they are not likely to get one more to their mind. But any suspicion of clericalism would at once have embroiled the Ministry with M. GAMBETTA. Just as M. THIERS claimed to have discovered that the Republic was the Government which united Frenchmen most, so M. GAMBETTA claims to have discovered that resistance to clericalism is the policy which unites Republicans most. In his speech at Lyons the other day he professed to see in the recent elections a conspicuous triumph of this policy. It is not the aspect which the elections wore to the eyes of spectators; and it may be suspected that M. GAMBETTA chooses to describe them in these terms because he knows that, so long as he can keep religious matters before the eyes of his followers, the political differences which separate them from one another will be less apparent. It will take some very decided measures of deference to the clergy to convince Frenchmen that there is any danger of improper submission to ecclesiastical pretensions on the part of a Ministry in which a Protestant is Minister of Education. Admiral FOURICHON, the new Minister of Marine, unites the seemingly inconsistent attributes of being a member of the Right Centre and of having been a Minister under M. GAMBETTA. His appointment may perhaps be accepted as conclusive evidence that the new Cabinet is not about to commit the blunders of which its predecessor was guilty, and to mix itself up with any shortsighted and unpatriotic attacks on the Government of National Defence.

Such is the Ministry which Marshal MACMAHON has persuaded himself to accept. As has been said, if he could have made equal advances to the Left six months ago, the results of the elections might have been less unfavourable to the policy which he personally favours. But the Conservatives around him could not be convinced that a judicious and timely compromise with the Conservative elements in the Left was the best issue they could expect. Whether it will be possible for the new Ministry to hold its own before a majority which must be described rather as critical and expectant than as positively favourable will probably depend on the promptness with which M. DUFAURE declares his acceptance of the particular Liberal proposals which he is willing to introduce into his programme.

AMERICAN OFFICIAL SCANDALS.

IN unanimously preferring articles of impeachment against General BELKNAP the American House of Representatives has undoubtedly expressed the indignant feeling of the whole country. The guilt of the delinquent is not denied, and the circumstances of his crime are in the highest degree simple and vulgar. As Secretary of War General BELKNAP had the patronage of certain frontier posts which provided opportunities of lucrative traffic with the Indians. In one instance at least the SECRETARY received an annual payment of 1,000*l.* from the occupier of the post, and it is naturally suspected that he may have made other arrangements of the same kind. The ultimate paymasters were perhaps the Indian purchasers, though it may be contended that the privileged trader would, even if he had not paid for his appointment, have charged for his goods the highest price which he could obtain. The distress which the PRESIDENT is said to feel since the discovery of the guilt of his Minister may possibly be aggravated by regret for the undue haste with which he believed his excuses and accepted his resignation. It seems that there was a technical doubt whether the process of impeachment is applicable to a criminal functionary after his retirement from office. The difficulty seemed to be imaginary, for no legislator would intentionally make the prosecution of a culprit depend on any condition subsequent to the date of his offence; but the objection was so far plausible that the Senate referred to a Committee the question whether the articles of impeachment could be received. It has since been determined that the impeachment shall proceed, and an ordinary criminal prosecution has been simultaneously instituted; though unexpected difficulties have subsequently arisen in the way of both modes of procedure. According to General BELKNAP'S first statement, the bribes had been received without his privity by his wife; but he professed to acknowledge his own formal responsibility for the transaction. The simple-minded PRESIDENT seems at once to have believed the improbable assertion, and consequently to have accepted the resignation, instead of either dismissing the offender, or suspending him from office while the House considered the propriety of an impeachment. General BELKNAP soon afterwards found it impossible to sustain the fiction which had sufficed to impose on the PRESIDENT. He now confesses his guilt; and it perhaps matters little whether he is sentenced by the Senate or merely relegated to infamous obscurity.

Only a few days before the occurrence of the latest scandal, General BABCOCK, the PRESIDENT'S private secretary, had been acquitted at St. Louis on a charge of complicity with certain distillers who have, with the connivance of the revenue officers, defrauded the Treasury of large sums. It was proved that the defendant had sent to some of the persons concerned in the fraud telegraphic messages which, according to the theory of the prosecution, were intended to warn them of the impending visits of inspectors or detective officers from Washington. One person concerned had inclosed considerable sums of money to General BABCOCK; but, according to his own evidence, he had afterwards withdrawn the drafts from the envelopes before they were transmitted by post. The evidence of the PRESIDENT, taken by commission, was highly favourable to the accused; but the Court rejected the greater part of the proof as irrelevant, and only received the remainder as evidence to character. General BABCOCK is entitled to the benefit of his acquittal; but it is unfortunate that the proved corruption of subordinate officers should have involved in suspicion the PRESIDENT'S most confidential assistant. The integrity and energy of Mr. BRISTOW, the Secretary of the Treasury, will probably during his tenure of office discourage the repetition of the frauds which he has exposed and punished; but it has been proved that the simplest method of evading taxes due to the Government is to divide the spoil with revenue officers. Mr. BRISTOW'S immediate predecessors, Mr. BOUTWELL and Mr. RICHARDSON, professedly made appointments to office on political grounds; and Mr. BOUTWELL, though he is not suspected of personal dishonesty, with the sanction of the PRESIDENT set the example of deliberately violating the law by reissuing a large amount of greenbacks which had been withdrawn from circulation. There was no reason to suppose that political nominees of the dominant party would be competent or scrupulous; nor is Mr. BRISTOW probably surprised by the discovery that his subordinates are open to bribes. It is not known whether he believed

before the verdict in the guilt imputed to General BABCOCK. With the indefensible acts of his colleague at the War Office he had no official connexion.

The enormous and impudent robberies perpetrated by TWEED and his accomplices at the expense of the City of New York were regarded in the United States with a feeling of amusement which interfered with due moral indignation. It was known that the swindling demagogues of the Corporation, in making vast fortunes for themselves, executed the intentions of their constituents, to whom they imparted a share of the plunder. After the full exposure of his frauds, TWEED was returned to the State Senate by the same Irish majority which had originally placed him in power. The inhabitants of other States and cities congratulated themselves on their exemption from the supremacy of an ignorant and dishonest immigrant rabble. The withdrawal of the better classes from public life, and the general disrepute which attached to professional politicians, failed to suggest the inference that legislators and functionaries who were not paid in repute or general esteem would be likely to pay themselves in money. A deeper feeling than the contemptuous irritation which had been provoked by the New York scandals was aroused by the exposure of the motives which had induced Congress to grant subsidies to the Pacific Railway. A large number of members had been bribed by the agents of the Company with shares or money; and one conspicuous Republican patriot, after selling his vote, had made an elaborate series of false statements to conceal his guilt. About the same time several Northern adventurers who had by the votes of the negroes obtained office in the Southern States committed flagrant acts of pillage. The discredit which consequently attached to the Republican party produced the reaction of 1874, which resulted in the return of a large Democratic majority to the House. The people of the United States sincerely dislike fraud and misgovernment; but unfortunately their institutions place them, except in times of excitement, at the mercy of professional politicians and election managers. The crime of General BELKNAP will perhaps in its consequences affect the Presidential election. A President who has during his term of office been constantly associated with persons of bad character will have acquired a reputation for bad luck, which is almost as conclusive against his claim to re-election as participation in the conduct of his favourites. It is not impossible that the discredit may extend to the Republican party; but unfortunately there can be no security against the recurrence of official corruption. It is now stated that strong suspicion of fraud attaches to other public functionaries.

Some improvement might probably result from the adoption of the scheme of Civil Service Reform which has been steadily discountenanced by General GRANT at the instance of his principal supporters in the Senate. A successful competitor in an examination has a fair chance of being personally honest; and the occupation of a permanent office with gradual promotion would furnish additional motives for good conduct. At present the local party managers have a large share in the distribution of patronage; and their nominees are appointed either because they have made themselves useful in elections or because they have purchased the good will of their patrons. During their continuance in office they are compelled to pay a heavy percentage on their salaries for the expenses of the party organization; and they probably find in the unavoidable tax an excuse for reconping themselves, as occasion may offer, by the acceptance of bribes. It would evidently be impossible to practise similar extortion if the Civil Service were independent and permanent; but until a higher moral standard of administrative integrity is established corruption will not be extirpated. Whatever may be done in relation to clerks and excise officers, Cabinet Ministers cannot be appointed by literary competition. The ex-Secretary of War is virtually convicted of receiving bribes, and the late Secretary of the Interior is charged with similar transactions. It is not for foreigners to suggest the securities which ought to be taken against the continuance of iniquities which are regarded in the United States with just and creditable disapproval. If the services of the best class of Americans could be obtained by the Republic, no further reform would be needed; but the moral and intellectual aristocracy will not court the patronage of election managers, and, if they entered into the competition for employment, they would not succeed. The measures of retrenchment which have lately been carried through the House of Representatives seem to be highly unseasonable. When men in high office take bribes, the presumption is not that public servants are overpaid. The Democratic majority has reduced the salary of the Minister in London, while General SCHENCK, having resigned his post under circumstances not yet fully explained, is crossing the Atlantic to vindicate his dealings with the Emma Mine; and it has been decided that the PRESIDENT shall receive the absurdly inadequate income of 5,000*l.* a year when his private secretary has been tried for corruption, and when his SECRETARY for WAR has confessed his guilt. In countries where official purity is the rule, certain American institutions have not yet been adopted. It is worth while to consider the tendency of further changes in the direction of democracy. Chivalry, according to BURKE, was the cheap defence of nations. The administration of public affairs by gentlemen may perhaps also tend to cheapness.

ITALY.

THE second Session of the twelfth Italian Parliament was opened by the KING on Monday last. That the twelfth Italian Parliament should be now sitting is not the least wonderful among the many wonderful things of the times; and the KING was able to address the Chambers in language which must have been pleasant to hear, and which, if a little coloured by hope, was yet based on a solid foundation of fact. Italy is prosperous within; and, for the first time since an Italian Parliament existed, the Chambers have before them a reasonable prospect of seeing the current expenditure nearly balanced by the receipts. That it will be quite balanced is perhaps too much to hope for. As the KING pointed out, new burdens are to be assumed by the Government, and, even if the receipts did balance the expenditure, there would still be the floating debt and a depreciated currency between Italy and perfect solvency. Still, if the immense difficulties which Italy has had to face are taken into account, the financial position is now better than could a few years ago have been anticipated, and great credit is due to SELLA for his energetic efforts to keep Italy in the right path, and to MINGHETTI for the assiduity with which he has followed in the steps of SELLA. Italy is on the point of renewing its Treaties of Commerce with its nearest neighbours, and the KING was enabled to announce that he saw the way at once to make good bargains with France, Austria, and Switzerland, and to maintain intact the principles of free trade. It is fortunate that in the case of France it was not necessary to solve the difficult problem of combining good bargaining with free trade during the government of M. THIERS; and it is satisfactory to find that the strenuous efforts of the Austrian Protectionists to take the opportunity of a depressed state of trade to force Austria into a retrograde path are not likely to be successful. With the army the KING is well satisfied, and his satisfaction is derived from what he has himself seen. Italy has worked very hard, spent much, and thought much in order to have an army able to maintain order at home and inspire respect abroad. The KING now tells his people that they have got a good army, and he speaks with the authority of an experience drawn both from successful and from unsuccessful wars. It is now nearly ten years since the raw army of Italy learned at the hands of Austria a severe but very useful lesson, and the KING, when he praises the army he now has, must mean that his troops would be able to fight on a footing of something like equality whoever might be the foe. The army being in good order, it is now, as the KING modestly puts it, time to attend to the navy. It is exceedingly improbable that Italy will for some time to come be able to afford the costly luxury of a new ironclad fleet for offensive operations. What money she has to spend for maritime purposes must be mainly spent on harbour fortifications and on vessels of defence. She may reasonably hope that, if she is prudent and pacific, she will not be without the aid of an ally possessed of much greater maritime power than herself should war be unhappily forced on her.

It is not, however, enough for the twelfth Italian Parliament to know that the present position of the country and its army is reasonably good. Italy aspires to more than this. She claims to rank as one of the Great Powers, and it is in this capacity that the KING statesthat she has addressed the Porte in support of the ANDRASSY Note. The Porte, owing to the curious intervention of the tiny State

of Piedmont in the Crimean War, cannot dispute the claim, and it may view the adhesion of Italy to the course taken by Austria with the complacency derived from the knowledge that Italy, like Austria, has done something to foment the insurrection which the Great Powers are now endeavouring to suppress. Whether as a signatary of the Treaty of Paris or as a Great Power, it is convenient that Italy should be invited to take notice that the bargain is reform on the one side and suppression of the insurrection on the other. Naturally, such pleasing tributes to the new importance of Italy as the visits in the year just finished of the Emperor of AUSTRIA and the German EMPEROR were not passed over by the KING; and when he thought of the more powerful and the more recent of his guests, VICTOR EMMANUEL may have congratulated himself on not having to occupy the attention of his Parliament with ecclesiastical squabbles. Benevolence ought always to accompany greatness, and Italy is now endeavouring to show that, if she is a Great Power, she is also willing to be a kind and useful one. The Italian Government acceded at once to the request of the KHEDIVE to nominate a Commissioner for the regulation of Egyptian finance. It has explained its readiness by pointing out that it seemed to it that Italy might act a useful part as a buffer between France and England in case disputes should arise between these two other Great Powers on Egyptian questions. That Italy owes much to France and to England every impartial Italian would readily admit. The debt to France is notorious to all the world, and the greatness of its obligation to England has lately been placed in a very clear light by the publication of Lord PALMERSTON'S letters. If Italy owes the origin of its unity and independence to France, it owes to England that they were not stifled immediately on their birth. The Cabinet of Lord PALMERSTON was engaged for years in seeing that the Emperor of the FRENCH did not kill his own political offspring. In its gratitude Italy now offers to appear in Egypt as the sedulous and impartial friend of those from whom it has received so many benefits. We have only to express our pleasure at this kind thought of us and our interests, and a little mild wonder at Italy having attained a position which qualifies her to step forward as a Great Power, and see in a brotherly sort of way that England and France do not fall out and do each other serious harm.

The principal measure which the KING had to recommend to his Parliament was the purchase of the railway system of Upper Italy. As this system is part of the same enterprise with a system of equal magnitude in Austria, the purchase has taken the form of an international arrangement, and the KING declares himself bound to carry out the convention he has made with the Emperor of AUSTRIA. The Government has also arranged for the purchase of the Roman and the Southern lines. Into the terms of the arrangements made it is not necessary to enter, further than to say that the basis is one by which the immediate outlay of cash is almost wholly avoided. An annuity is to be paid to provide for the obligations, and an issue of Italian Rentes gives such compensation to the shareholders as they have been able to exact. But it is the Companies who have been anxious to sell, as they have been labouring under financial difficulties, and have allowed the lines to get into bad order. Money will have to be provided for renewal and new equipment, and the Government has had to purchase the lines in order that the traffic of the country may be carried on. There are some advantages in the railways of a country belonging to the State, and Italy may perhaps one day find that it has benefited pecuniarily by having bought up its railways when they were to be had at a comparatively moderate cost. But for the moment the necessity of providing cash to put the lines in fair working order will be a serious burden on the Treasury, and the management of a great railway system by the State is a very anxious business. The dangers of jobbery, of abuse of political influence, and of the State being forced by clamour to reduce its tariffs below a remunerative level, are very serious, and are especially dangerous in a country like Italy, where there is great difficulty already in shaking off the bad traditions of the world of unscrupulous and over-numerous officials fostered by the petty Governments which formerly had possession of the country. It is not improbable that the question that will excite the liveliest discussion in the Italian Parliament will be not whether the arrangements for purchase should be sanctioned, or whether the terms are satisfactory, but how the railways are to be worked when the State has got possession of them. The Government has recently had a warning of the losses it may sustain when it listens to appeals made on behalf of commercial undertakings. In deference to urgent representations made by prominent members of both political parties, the Government not long ago advanced a large sum to a Company carrying on a packet service in the Mediterranean on a scale which even in England or France would be thought considerable. In spite, however, of the assistance tendered to it, the Company had soon afterwards to declare itself insolvent, and the Government to all appearance did no good by a liberality which Italy could very ill afford. The Government may not have much reason to fear hostile criticism on its blunder, as it acted in accordance with the wishes of opponents as well as of friends. But the incident will be fresh in the memory of all who have to consider the precautions under which the management of the State lines is to be carried on. If the lines could but be well managed, there is probably nothing in the purchase to injure the financial position of the country; but it is so uncertain whether the lines will be well managed that it is impossible not to recognize that a new cloud threatens to overshadow Italian finance. It is a cloud that may fade away, and the clouds that threaten Italy have a singular turn for fading away; but it is also one that may grow larger and darker than it will be at all agreeable for Italians to contemplate.

THE BURIALS AGITATION.

THERE is something very significant, though perhaps injudiciously candid, in the jubilation of the Liberal organs over the result of the division on Mr. OSBORNE MORGAN'S Resolution. The nominal question at issue sinks out of sight, or is just touched upon in a passing way. The critical importance of the event is found, not in its bearing on the Burials question, but in the fact that it has afforded the scattered sections of the Liberal party an opportunity of again meeting each other in the same lobby. The estranged brethren have kissed each other, and the flock has once more been gathered to the fold at the call of the shepherd. "The Conservative party," screams the *Daily Telegraph*, with its hat in the air, "has been out-"manœuvred." "A powerful force, combining the ardour "of the Dissenters, the energy of the Home Rulers, and "the statesmanship of the Whigs," has at last been brought together, if only for a single night, under Lord HARTINGTON'S guidance, and it is hoped that the sulky alienation of the Dissenters is now at an end. How to bring back the missing contingent has been for some time a crucial question for the Liberal party; and many ingenious minds have no doubt been brooding over it. The attempt to get up an agitation about the Slave-Trade Circular has, for obvious reasons, not been very successful. But Mr. OSBORNE MORGAN'S Resolution offered another chance, and has been more judiciously worked. We are indebted to the *Daily Telegraph* for the information that "it is especially good for the "Liberals to give battle on a question of sentiment rather "than of practical reform." It is in the sphere of sentiment that they have found inspiration for all their great achievements; and "the strength of the party is in its feelings, not "in its opinions." "A strong sentiment unites all sections of "Liberals, as pieces of iron of different quality can be fused "by fierce heat." There can be no doubt that, as MOODY and SANKEY as well as Mr. GLADSTONE have shown, emotionalism is a great force in its way. When Mr. GLADSTONE came into office the party was roused to heroic ardour. Everybody felt that common things had ceased to be, that human nature had been delightfully sublimated, and that the perfection of everything was very near at hand. No doubt this sort of excitement is very stimulating while it lasts, and there are various symptoms that the Liberal party has still a hankering for another bout of it. These have been dull times of late; and it is easy to understand the fondness with which fervent Liberals look back on the exhilaration of other days.

It is important to bear this attitude of the Liberal party in mind in studying its connexion with the Burials agitation. It is thought to be necessary to weld the different sections of the party together; and as the *Daily Telegraph* justly observes, there is nothing like getting up "a fierce "heat" for such a purpose, and any fuel that happens to be handy will do very well. This is really the main cause of the agitation. What is called the Burials question is—

fact, two questions, or at least a question with two faces. On the one side is the plain, practical question how public provision is to be made for interments; and on the other is the problem how to get up a sensational white heat for the engineering purposes of the Liberal party. What, then, is the grievance which is complained of? From of old church and churchyard have been regarded as one; until a comparatively modern period everybody was, as a rule, baptized at the parish font, married in the church, and buried in the churchyard, with the services of the Church in each case. There was no element of sectarian controversy in the matter; the services of the Church were open to all the population alike; and every one accepted these services as a natural part of an Englishman's birthright. In the course of time people began to indulge their private tastes as regards preaching, and when they did not like the parish clergyman they went elsewhere. But still the main body of the population, however averse some of them might be to the parsons' sermons, clung instinctively to the national system of marriage and burial. They felt that they were more akin with their race if on these solemn occasions they were identified with the old, time-honoured services which had been so dear to many generations of their countrymen. The Church made no difficulties as to keeping open doors for every class, for this was indeed alike its privilege and duty. Nobody was compelled to come, but all who came were welcome. In those days philosophical Liberals had not discovered that a church could be a church without a creed. Nothing would then have been more startling to the minds of men than the notion that the temple in which they worshipped was only a fortuitous agglomeration of stones and lime, not especially identified with one sort of service or form of belief more than another. There is perhaps no stronger example of the way in which even clever people get confused and bewildered by the use of cant expressions than the sort of argument which was heard on Friday week, and which is constantly raised in discussions of this kind. Sir W. HARCOURT, for instance, was not ashamed to repeat the question which had already been asked by members from whom it came more naturally—Is not the Church degrading itself into a sect by proclaiming its belief in anything in particular? Mr. CROSS had referred to the practice of the Quakers in regard to their own graveyards, and Sir WILLIAM, with pathetic amazement, very much in the tone with which Mrs. SIDDONS used to frighten the drapers by asking "Will it wash?" exclaimed, "What! is "the National Church to be dethroned from its rank "as an establishment, and reduced to that of a sect?" Every Church must of course be a sect, in so far as it professes a distinctive religion; the difference between the Society of Friends and the Church of England is not that the former has peculiar tenets and the latter has not, but that the Church represents the common feeling and belief of the great body of the English people, while the Society of Friends represents only the opinions of a small and eccentric denomination. As soon as the principle is laid down that the Church of England is a mere question of masonry, a sort of St. James's Hall, which any set of people can have the use of for any performance they like, the Church is practically disestablished. There are weak-minded persons even in the Church of England who are deluded with the idea that it would remain a Church even though its pulpits were open to anybody and everybody to preach what they pleased. It is obvious, however, that though the Church might still remain in a certain way a useful public institution, just as a town-hall is, it would certainly not be the Church of England in the sense in which it has always existed. And this is what those who are in earnest in enforcing the claims of Dissenters to the parish churchyards on their own terms have in view. It is important to observe that the Resolution, as it was proposed, started with a mis-statement. It asserted that "the parish churchyards of "England and Wales had been appropriated to the use of "the entire body of the parishioners." This is true as far as it goes; but it leaves entirely out of view the rather material fact that this right exists only on specified conditions. Again, the Resolution laid down that it is "just "and right, while making proper provision for the mainte-"nance of order and decency," to make certain changes; but the speech of the mover showed that this was a mere form of words, and that there was no intention whatever to take any precautions to maintain order and decency, but that it was part of the scheme to throw open the churchyards for the performance of any kind of ceremony or demonstration which the persons conducting a funeral might choose to resort to. Mr. OSBORNE MORGAN said very frankly:—"I will tell the House what safeguards I would "propose. None whatever. This is a matter on which "we might safely trust to the good sense and good feeling "of our fellow-countrymen." It is notorious, however, that there are sections of the community who have peculiar notions of decency and order which are not shared by the rest of mankind. As to the final conclusion, it was also delusive, because what it proposed was not an enforcement of existing rights, as was pretended, but an innovation based on grounds of supposed expediency. The whole Resolution was therefore disingenuous and illogical.

The HOME SECRETARY, by reducing the subject to its matter-of-fact elements, immediately brought to the ground the artificial structure, all canvas and daubing, which Mr. OSBORNE MORGAN and his friends had so laboriously constructed for the occasion. The sober facts of the case may be simply stated. Either there is something distinctive about a parish churchyard or there is not. If there is, why should people who affect to despise its character and associations, and who sneer, with Mr. BRIGHT, at "What d'ye call it, consecration?" be so anxious to be buried there when they can easily be buried somewhere else? If there is not, what does it matter in what enclosure a body is laid? Again, if it is such a matter of conscience with the Dissenters to have their own peculiar services, it is equally a matter of conscience with Churchmen that their similar rights should be respected. They are in possession; prescription is on their side; the churchyards are in law freeholds of the rector or vicar just as the churches are; and if these rights are taken away, it will be the first step towards disestablishment. Disestablishment, of course, may or may not be desirable, but at least it should be done openly and deliberately, in full view of what it means. There is nothing either in the marriage or burial services which offends any body of Christians; and it is notorious that a large number of Dissenters prefer them to the extempore utterances of their own ministers, and that in many places where there is a public cemetery, containing both consecrated and unconsecrated ground, Dissenters resent being buried in the part reserved for them, which remains empty, while the other is crowded with their bodies. It would seem to be natural therefore that where there is a choice of accommodation, Dissenters should go where they can be comfortable in their own way, and they suffer no grievance in having to do so. The question thus resolves itself into what should be done in the comparatively small and continually decreasing number of cases in which the parish churchyard is the only available place of sepulture. Mr. CROSS's statistics show that, as the churchyards fill up, and population increases, the churchyards are closed and cemeteries have to be provided; and no reasonable person can doubt that a public necessity of this kind ought to be provided for systematically. Before very long, at the present rate of burial, all the churchyards will be filled up; and then there will be no question of anybody being buried in them. Nothing can be more preposterous than to make an organic revolution for the sake of adjusting a small detail of machinery which is every day settling itself by the mere course of events. It is satisfactory to know that the Government has undertaken to deal with the question in the only way in which it requires to, or can safely, be dealt with—its practical aspect—and it is to be hoped, as Mr. CROSS said, that we shall hear no more of these miserable little ecclesiastical disputes which are manufactured only as an instrument of political agitation.

THE SLAVE CIRCULAR IN THE LORDS.

THE history of the Slave Circulars is a proof that it is not always an advantage to have several alternatives to choose from. The Government were in this position as regards the issuing of instructions relative to the treatment of fugitive slaves. They had in the first instance to decide whether to do something or to do nothing. It has been contended that here was their first blunder. They might, it is said, have issued no instructions on the subject, and then there would have been neither First nor Second Circular, nor Royal Commission, nor debates in either House. This criticism has a good deal of wisdom in it, but it is the sort of wisdom that commonly comes after the

event. It is now seen that the action of the Government has been unfortunate, and it is very natural to ask why they could not have let things alone. Supposing, however, that they had let things alone, and that thereupon some naval commander had got into difficulties about an escaped slave, it would have been equally natural to ask why a Cabinet which had been warned by the Indian Government that the question threatened to become troublesome had been so weak as to leave it to the discretion of the first blundering naval officer whom chance might take into the Persian Gulf? But the propriety of framing a Circular of some kind does not involve the propriety of issuing the wonderful document which made its appearance in the summer. Still it would be unkind to lay much stress upon this point, because, as soon as the Cabinet came to know what was in the First Circular, they were as much ashamed of it as any one else could be. It was hastily buried, and no one but the ATTORNEY-GENERAL attended the funeral. Thereupon the Government had once more to choose between action and inaction. The same reasons which had made it expedient to put out the First Circular made it equally expedient not to leave the ground unoccupied when it had been withdrawn. The error on this occasion was that, while professing to give their commanders positive instructions how to treat such slaves as might come on board, the Government did not think it necessary to make their instructions precise as well as positive. They were of one mind as to throwing over the ATTORNEY-GENERAL, and as to maintaining both the extra-territorial character of a QUEEN'S ship on the high seas and the effect of that extra-territorial character on the status of slaves received on board. But they could not come to any conclusion as to what should be done with a slave who has got on board a QUEEN'S ship in territorial waters. It was easy enough to say, Don't let a slave get on board if you can possibly help it; but the united intelligence of the Cabinet was baffled by the hypothetical inquiry of an imaginary commander, If I have not been able to help it, what am I to do with him afterwards? The excitement caused by the publication of the First Circular prevented them from answering, Give him up to his owner; an appreciation of practical difficulties prevented them from answering, Keep him on board until such time as you can land him in some territory where his freedom will be respected. In this dilemma they issued an order which either threw the responsibility of a decision upon the commander of the ship, or, if he tried to follow the letter of his instructions, bade him put the slave on shore and then shut his eyes, so that he might not see what became of him. Even if this Second Circular had been allowed to pass unchallenged, it could only have put off the evil day. A commander whose sympathies were with the slave would have read the direction not to give him up to his master as tantamount to a direction not to turn him out of the ship so long as there was any chance of his master catching him. A commander who simply wished to obey orders would have put a slave on shore under circumstances only colourably different from a formal surrender. In one way or the other the question would have again presented itself for settlement, and the Cabinet would have found that they had gained nothing by postponing it. Chance, in the shape of a popular dislike of the Second Circular almost as great as that felt towards the First, saved the Government from this misfortune. Whether they ultimately invent a policy for themselves or are content to take one at the hands of the Royal Commission, the whole question of the treatment of fugitive slaves will have to be determined once for all. Everybody now knows, or may know, that English naval officers all over the world are waiting for orders whether, when their ships are lying in territorial waters, they are to give up escaped slaves to their masters, or to keep them on board until such time as they can set them free. It will be impossible to keep secret the answer which must ultimately be given to this inquiry, and it may be doubted whether in the end the Government will have really avoided responsibility by the expedient of asking some one else to frame their answer for them. Slave Powers will not be mollified, when their demands for the return of fugitive slaves are refused, by the intimation that this new policy is not the work of HER MAJESTY'S Government. The English people will not like the surrender of fugitive slaves any better because it takes place at the suggestion of a Royal Commission.

Down to the debate in the House of Lords on Tuesday the object of the Government in appointing the Commission was at least intelligible. They had unexpectedly found it necessary to have a policy about fugitive slaves, and they had set half a dozen clever people to invent one from sheer inability to invent one for themselves. The only wonder was why, under these circumstances, the Second Circular had not shared the fate of the First. If the matter was so surrounded with uncertainty that only a Royal Commission could clear it up, why should the Government be anxious to move in it prematurely? Lord CAIRNS's speech has entirely upset this theory. If the LORD CHANCELLOR'S closing sentences are any index to the feelings of the Cabinet, they burn with desire to see the policy which only a few weeks since Lord CAIRNS himself embodied in the Second Circular completely reversed. The last part of his speech might have been delivered at an anti-slavery meeting. "I am ashamed," he cried, "to speak even for a moment as if slavery were a "question on which HER MAJESTY'S Government could en- "tertain any doubt." This argues a really remarkable advance from the time when HER MAJESTY'S Government entertained so much doubt about slavery that they ordered every commander of a QUEEN'S ship not to admit a fugitive slave on board unless his life would be in manifest danger if he were refused admission, and not to allow him to continue on board a moment after the danger was past. A slave who, in consequence of this Circular, has found himself sent on shore with the knowledge that before he has left the ship many hours he will be once more in his master's custody, will be disposed to agree with Lord CAIRNS that slavery is a question on which HER MAJESTY'S Government have a very decided opinion. The difference is that the slave will believe that HER MAJESTY'S Government are on the side of the master, whereas Lord CAIRNS is apparently under the impression that they are on the side of the slave. "HER MAJESTY'S Government," he goes on, "have not concealed, they do not desire to conceal, "their policy, and to that policy they intend to adhere." Really this is the most perplexing assertion that has ever been made by a Cabinet Minister. All the world has supposed that the Government had a policy; that this policy was contained in the Second Circular and was abandoned by reason of the bad reception which the Second Circular met with; that the Second Circular met with this reception because it was supposed to favour the slave-owner, and that a Royal Commission had been appointed to spare the Government the annoyance of having to eat their words. Now Lord CAIRNS comes forward with a theory of the Second Circular which is opposed alike to the letter of the document, to the opinion which has universally been formed of it, and to the interpretation put upon it by one of his own colleagues in the House of Lords not two hours later. We are now, he trusts, about to take a step towards the time when we may anticipate the destiny of this country to consummate the overthrow of slavery; and this step will be merely a justification of the policy set forth in the Second Circular. It is conceivable that the Royal Commissioners may recommend that a slave shall not be dismissed from a QUEEN'S ship until his freedom is absolutely assured. It is conceivable that they may recommend that, in order not to offend slave-owning Powers, a slave received on board a QUEEN'S ship in territorial waters shall be put on shore as soon as his pursuer's back is turned. But it is not conceivable that a body of Commissioners should make the latter recommendation, and at the same time believe that they are consummating "the overthrow of that nefarious "system which has been at once the curse and the disgrace "of humanity." This is a triumph of rhetorical combination which only men of Lord CAIRNS's calibre can achieve, and which even they cannot maintain for more than a few rapturous moments.

CHRISTIANITY BETWEEN TWO FOES.

IN an address which he delivered some years ago before a religious Congress at Munich Dr. Döllinger starts from the assertion that by the cradle of Christian theology stood two mighty foes, heathen philosophy and the heretical gnosis, with both of which it had to contend, and from both also had much to learn. No student of ecclesiastical history will question the correctness of his statement. But a still broader truth is conveyed in a remark we came across the other day, which applies, not only to the early Church, but to the whole course of Christian history from the beginning till now. Christianity, it was observed, has in every age been confronted by two rival religions; its morality has been threatened by the higher Paganism, or worship of beauty; its doctrinal system by a scientific Theism, or worship of what claims to be pure and absolute truth.

With both of these it has always been in conflict, and yet to both it has been constrained to own its obligations; and this mutual interchange of blows and courtesies was never more conspicuous than in our own day. A distinguishing feature of the last half-century has been the revival of artistic taste and culture within the Church throughout Europe, of which the so-called Ritualistic movement is one subordinate phase; but alongside of this ecclesiastical restoration there has grown up a religion of art independent of all theological restraints, and looking on them much as the Roman and Florentine *literati* of the Renaissance looked on the reforms of Savonarola. Meanwhile the dominant scientific school is impatient of any Deity that cannot be resolved into an impersonal abstraction, and declines to proffer more than "a silent worship at the altar of the Unknowable and Unknown." Yet, at the same time, the exponents of the extremest form of scientific Atheism loudly assert their claim to be the prophets of a new and exclusively true religion. And, however much we may smile at the half-grotesque details of the Comtist creed, with its elaborate mimicry of the hierarchy, the discipline, and the ritual of Catholicism, no one can fail to be struck with so unexpected a homage to the inextinguishable cravings of the religious sentiment, which it as fully recognizes as it entirely fails to satisfy. Nor can the Church, which has in former periods accepted the services of an Augustine, an Aquinas, and a Pascal, affect to ignore in our own day the need for scientific champions of her cause. It may perhaps be said that these opposite forms of faith or scepticism, in whichever light we choose to regard them, are now more confident and impetuous in their assault than has usually been the case before, and that they more distinctly assume the functions, not of mere negative criticism, but of rival creeds. Whether or not Mr. Mill could be fairly considered a Theist, he inculcated a kind of religious and ethical system of his own, often borrowing the language, if not the ideas, of the historical religions which he rejected. And the same may be said of some living writers who would be classed more or less in the same category with him. And thus again the artistic religion of Paganism finds a passionate apologist in Mr. Swinburne. But if there is some difference in their methods of warfare, the same triangular duel, so to call it, between Christianity and its two powerful rivals has been in progress continually since the first preaching of the Gospel. The two mighty antagonists stood, to repeat Dr. Döllinger's language, by the cradle of the nascent faith; but the infant Hercules proved strong enough to coerce, if not to strangle, them, or rather succeeded in bending them to the service of a power yet mightier than themselves. Some change there has been no doubt in their relative importance as mankind has gradually advanced from what has been termed the mythological to the physical stage. Pagan art was a far more formidable opponent to reckon with in the first century than Pagan philosophy; the opposition of science, which cannot always be thrust aside as false, gives much greater trouble to the apologists of Revelation in the nineteenth. Let us begin with art.

From the earliest period of which any records remain art has been a powerful factor in the religious development of mankind. It has been by turns the instrument and the tyrant of the national faith, or sometimes both together. Greek religion, which was the worship of natural beauty, expressed itself in those unrivalled artistic forms which have riveted the admiring gaze of successive generations for above two thousand years; but the chisel which wrought so marvellously in its service was tracing the lines of its corruption. Its most exquisite art was the efflorescence of decay. The gods who were worshipped with sincere devotion were the deities of Homer, not the creations of Phidias, and it was only by crushing the genius of its artists that Egypt so long preserved the sombre grandeur of its hereditary faith. Christianity could afford to be less jealous, although the early Fathers betray an uneasy suspicion of whatever had been associated with Paganism. And accordingly the Catacombs, which were the first homes and workshops, as well as the sepulchres, of the new religion, are profusely ornamented with sculpture borrowing the imagery of existing forms of art. A refined and graceful Christian symbolism was by degrees superinduced on these ancient models; but it showed nothing of that darker and sterner aspect of Gospel teaching which was afterwards so abundantly exhibited in churches and cemeteries; there were no representations of hell or purgatory, or of the Last Judgment; and, what seems stranger, there were at first no representations of the Passion. The fiery persecution through which so many of those who were thus piously commemorated had passed to their rest was but distantly alluded to in an occasional picture of Daniel among the lions, or the three holy children walking unharmed amid the flames. All this was changed of course at a later date, and, in spite of the triumphs of mediæval architecture, it is true to say that, as the purely religious sentiment attained its ascendency in the "ages of faith," æsthetic art on the whole declined, to revive with the irreligious, or at least non-religious, outburst of the Renaissance. Yet Christianity never forgot, like narrower and more artificial creeds, that its world-wide mission imposed on it at once the capacity and the obligation of embracing every genuine product of the human intellect and heart. The contrast is strikingly exemplified if we turn for a moment to Mahometanism, which could only hold its own against the inroads of idolatry by sternly proscribing art. The Arabian prophet, it has been truly said, could not prevent his disciples from worshipping images, except by absolutely forbidding them to make any; and thus "he preserved his religion from idolatry, but made it the deadly enemy of art," as it has remained ever since. The same criticism applies, in a more limited sense, to the illogical compromise by which the Iconoclastic controversy was eventually settled in the Eastern Church, permitting pictorial, but prohibiting sculptured, representations of sacred subjects. We have said that the Renaissance was not a religious movement. In its artistic development there is a close analogy to what has already been noticed in the case of ancient Greece. Instead of using his art to do honour to religion, the painter made religious conceptions subservient to the display of his artistic power. The devotional and the æsthetic temper are distinct, though not incompatible, and seldom predominate in the same class of minds. It was perfectly natural that an ardent reformer like Savonarola should head a crusade against a classical revival which had brought not only the arts, but the tastes, the sensuality, and the scepticism of classical Greece in its train. It had already been strongly denounced and indeed forcibly suppressed by Paul II., though his successors in the Roman see for some time afterwards by no means followed his example in this respect. But neither Pope nor preacher could permanently arrest the degradation of religious art which rapidly followed, and the course of which may even be traced in a comparison of the earlier and later pictures of Raffaelle. There cannot be said to be a school of religious painters in the present day, though some of the earlier works of the pre-Raffaellites may have suggested an anticipation not destined to be realized. In another department we have indeed witnessed a remarkable resuscitation of distinctively religious art, for it is quite true that Gothic architecture and the love of it are intimately connected with the Christian, as contrasted with the Pagan or secular, habit of mind; and Mr. Lecky is probably right in saying that "we mainly owe the revival of Gothic architecture to the Catholic revival of the present century," though the party dominant just now in the Roman Catholic Church have betrayed their instinctive aversion to history by opposing it.

In the early Christian centuries physical science was not sufficiently advanced to present any serious difficulties to the Christian apologist. St. Augustine could easily dispose of Manichean objections to the Mosaic cosmogony in a fashion which would never occur to a very inferior class of thinkers now; and in the sixth century Cosmas Indicopleustes—the special butt of Mr. Matthew Arnold's raillery—carried public opinion with him when he argued against the antipodes in his *Topographia Christiana*, for this reason, among others, that St. Paul speaks of all men living "on the face of the earth," which proves that it is flat and not round. It is fair to add that when St. Virgilius, two centuries later, maintained the existence of the antipodes, the Pope declined to condemn him, but the religious world of the day was profoundly scandalized. We need not stay to dwell here on the critical instance of the Copernican controversy, but it is notorious that there has been a chronic feud between theologians and men of science, which one class of writers is fond of representing as the gradual triumph of science over a dwindling supernaturalism. This is the leading idea, for instance, frequently avowed and always implied, which runs through Mr. Lecky's History of Rationalism. On the other hand, as was pointed out before, if the Church has been jealous of scientific, as of artistic, encroachments on her own domain, she has numbered great philosophers as well as brilliant artists among her most devoted servants. In the fifteenth century Christianity appeared to be engaged in an internecine struggle with the Pagan revolt against her ethical code; in the eighteenth a Deistic philosophy questioned the primary articles of her creed. In our own day the controversy has passed into a new phase, and arguments which were unanswerable in the mouth of Bishop Butler fail to convince disputants who repudiate, not his reasoning, but the premisses admitted in common at the time by himself and his opponents. It is not unreasonable, however, to believe that a religion which has survived so many open or insidious attacks will still be equal to the crisis. A way may be found in the future as in the past for acknowledging the legitimate claims of science without resolving into a beautiful but visionary "Aberglaube" the faith which has ennobled the life and consoled the last hours of sixty generations of Christians. Meanwhile it is significant that the great master of the positive philosophy in France should have passionately proclaimed the indestructible necessity of a religion, while the chief upholder of a similar system in England has left on record his conviction that the Christian religion has certainly been useful, if not indispensable, hitherto, and in part at least may not impossibly be true.

TIGER-SHOOTING.

THE round of amusements and spectacles endured or welcomed by the Prince of Wales on his Indian tour would have been incomplete had he not seen "a tiger or two," and felt "a little heat in the middle of the day"; two inconveniences to which, as Dickens put it, the perils of an Indian career are supposed to have dwindled down. We should hardly, perhaps, have selected Jeypore as the place where the Prince was likely to bag his first tiger, and we might rather have expected that some Commissioner of division, equally at home with land revenue and large game, would have organized for him a hunt on a grand scale. But the best season for this kind of sport will begin when the Royal trip ends; and people in England may be surprised to hear that there are many districts in

where the tiger has no existence, and many hundreds and thousands of agriculturists who have never seen any bigger animal of the feline tribe than a civet cat, a lynx, or a chance leopard. Indeed the appearance of a tiger in some large and populous tracts in Lower Bengal, Behar, and Hindostan Proper, would cause as much amazement as the unlucky Esquimaux dog which, as we learn from *Land and Water*, was lately pursued and hunted to death by the farmers of North Hampshire, under the impression that a wolf was threatening their sheepfolds. Peace and security, and the natural progress of a population content with little and finding it in a bountiful soil, have been too much for sundry species of wild animals, except the hog, the antelope, the fox, and the jackal. Of the last two, indeed, the former may be seen any morning on the glacis or the esplanade of Fort William, and the jackal may be heard any night howling dismally in the most fashionable streets of Calcutta. There are, however, several provinces in which deaths by tigers still maintain a high average, and to which large parties resort in the months of March, April, and even the hottest days of May. The railway, too, has made these select hunting grounds more accessible, and it is now part of the programme of a tourist to have a shot at a tiger, as well as to admire the Taj Mahal, or buy on the spot photographs of the Cawnpore Memorial and the ruined Residency of Lucknow. There is, we think, little fear that the race of the royal Bengal tiger will speedily become extinct. He is to be found in the tract of the Sunderbunds, within fifty miles of Calcutta, though from the nature of an alluvial soil, intersected by a network of tidal creeks and covered with thick rushes and fine timber, these muddy islands are for practical purposes of sport entirely useless. But the Malda jungles, in the vicinity of the ancient city of Gour, the Rajmahal hills, the sandy alluvial flats of the Brahmaputra, the Megna, and several other large rivers in Eastern Bengal; the whole tract which lies at the foot of the first range of the Himalayas, beginning with Purnea and ending with Moradabad and Saharunpore; a few places in the Punjab, parts of Orissa, a large portion of the Central Provinces, and others—these still contain shrines sacred to St. Hubert, spots where the axe of the pioneer makes slow progress, where the herdsman still trusts to his tame buffaloes to ward off the common enemy, and where the postman does not very much care to perform his woodland stages alone.

There are three or four ways in which tigers are commonly destroyed by Englishmen. One of the most hazardous is to go after the animal on foot. That men are found to court the obvious risk of coming suddenly on an animal with the eye of a hawk, the agility of a deer, the subtlety of a fox, and the strength of half-a-dozen horses, in the midst of thickets or in ravines or hollows where no room is left for evolutions; that, armed with a rifle of the newest pattern and backed by a single attendant who carries a spare gun, sportsmen have repeatedly been known to send an ounce ball into the skull of the tiger as he crouches for his spring, and even to stop him in mid air; that sad stories of wounds and deaths caused by these unequal encounters will not hinder successive generations of sportsmen from tracking the bison, the rogue elephant, and the man-eater, when they can only see a few yards ahead, in sole reliance on a cool hand, an even pulse, and a correct eyesight—these are facts which merely prove that there is no form of hazard or adventure which comes amiss to Englishmen. And in justification of these attempts it must be admitted that there are, in Madras especially, jungles in which elephants cannot manœuvre, or provinces where they are not to be had. But the practice is akin to rashness, and almost smacks of folly. A second mode of getting rid of some one well-known animal particularly obnoxious to the villagers is for the Englishman to sit up at night in a tree or elevated stage, close to a slaughtered bullock, and take the chance of hitting the tiger in the moonlight when it returns to finish its meal. We have even known an inverted cask, covering the shooter and fixed in the ground, with a loophole, to be employed for this purpose. A third plan is yearly practised in the Rewa and Mirzapore jungles. The shooters take up their positions on elevated platforms extemporized from bamboos or *sal* trees, at intervals, along the line which the game is made to take. A long array of beaters, disposed by skilful Jemadars and Shikaries, and provided with drums, fireworks, and sounding instruments, sweeps the jungles leisurely, and drives the game of all kinds in the direction of the expectant and sometimes sleepy and recumbent sportsmen. Great patience and perfect knowledge of the country are requisite for success. And, with good management, deer of two or three kinds, bears and leopards, and feathered game of various sorts, reward the plan and the execution. There may be a brisk fusillade as the line of beaters approaches, but there are no very hot corners. This kind of tiger-hunting is called a *hank*. It is, in its way, exciting, and is rarely attended with any danger. The last and most orthodox way of killing tigers is from the howdah on the back of the elephant. Here you may have the minimum of danger with the maximum of success. But several essentials go to the formation of a good party. You must not be too early or too late in the season. If a good deal of superfluous grass has been burned, so as to leave certain spots where all wild animals can congregate; if the hot winds have not been too powerful, and there are still pools to which deer, buffalo, and tigers can resort; if neither of those well-known crack shots, the Nawab of Barootpore or the Maharaja of Bundooknuggur, have been beforehand, tantalizing you with rumours of innumerable tigers slain, the best beats, and driving the big game across the border if the expedition is under the command of some sagacious civilian or experienced planter, whose influence will be sufficient to keep order amongst the mahouts and dispose the trackers to do their very best in the common cause—if all these requisites can be combined, then there is every chance of a good miscellaneous bag, beginning with snipe and black partridge, and culminating in half a score of tigers, with a rhinoceros or two. As a general rule, every kind of game abounds in a tiger jungle; or it might be more correct to say that tigers seek their living in jungles frequented by every sort of game, including numbers of deer and wild boar. But there are certain rigid rules to which every member of the party must submit. When there is reason to suspect the presence of a tiger, not a shot can be fired at any other game. Deer must bound away untouched from under the feet of the elephant; a herd of buffaloes must crash uninjured through the forest; the black the peacock, the jungle fowl, and even the floriken must rise in succession, presenting an easy mark as they come up to the level of the howdah, and yet the fowling-piece charged with No. 6 or No. 5 shot must not be discharged. When the tiger has been roused, or when the long search has been unrewarded, then, on the homeward beat, perhaps the ban is removed and sportsmen are licensed to pop at anything. Very often a tiger is started close to some elephant; two or three practised shots fire at the waving grass or well ahead of the tail which is seen to curl for a moment; all is silent; or there is a growl and a few struggles; and the shout of a mahout or a beater announces that the animal is no more. The late Mr. Bateman, a planter in the Malda district, many years ago, was actually in conversation with Miss Eden, the sister of Lord Auckland, explaining to her the secrets of woodsman's craft, when he disposed of an animal in this way by one single and well-directed shot.

But tigers are not always to be rolled over like rabbits. Every now and then sensational elements are not wanting. The tiger is only wounded, without detriment to his powers of attack; or he is disturbed at his morning meal, or during the process of digestion, and is naturally indignant; or, if the male has slunk off, the tigress, with three cubs, is left behind and shows fight. Then occurs a scene which has often been described at much greater length than we can afford. With tail erect, open jaws, and a roar that frightens the less practised elephant, down comes the assailant; and in far less time than we can write it, he has made good his position on the head of a splendid female elephant. Two elephants with pads or mattresses, on which a couple of natives are squatting, make clean off. Their flight unsteadies another, hitherto thought to be staunch, and therefore fitted with a howdah, and the three crash through the jungle, trumpeting aloud, while the mahouts vainly dig their iron hooks into the heads of the runaways, and the occupant of the howdah, with both his barrels at full cock, may hear them go off, or runs the chance of being dashed violently against the boughs, which are just high enough to allow the elephant itself to pass beneath. Meanwhile the tiger growls and claws freely, and the elephant endeavours to shake off its adversary or get it for a few seconds beneath its feet. No one dares fire; one sportsman, because he has enough to do in the way of holding on; the others, because they might in all probability hit the mahout, whose legs are within three inches of the tiger's fore paw. At length the incumbrance is shaken off, and a sharp volley settles the affair. There are some maxims which a cautious sportsman will always bear in mind. Never get off your elephant to inspect a tiger until you are quite sure he is dead, and, above all, do not go on foot in search of an animal you have severely wounded. Never allow your elephant to stand still when beating for a tiger at which you have fired. The sportsman who does not "keep moving" is the one almost invariably selected for attack. Remember that a tiger out of his beat, surprised by daylight and compelled to take shelter in any scrap of jungle, may charge at any moment, unprovoked, for the simple reason that no other refuge is left him.

The recent splendid display of the Prime Minister of Nepaul recalls visions of grand battues when wild animals were more numerous than they are now, and when two or three tigers might be on foot at one and the same time; but we do not care to provoke incredulity by recounting the number of these animals that are said to have been "padded"—*i.e.* laid across the mattresses of the elephants—by crack shots in the early years of this century. The following items of sport may, however, be relied on. A general officer, still living, had at one time of his career certificates from the revenue authorities, who are the dispensers of rewards for the destruction of ferocious beasts, to the effect that he had killed more than three hundred tigers—this being about the number of Saracens that Brian de Bois Guilbert had slain with his own hand. Another sportsman, just thirty years ago, on a quiet official tour throughout his own district, came across thirty-one tigers, and accounted for twenty-nine; a proportion which shooters in Norfolk at battues of pheasants would allow to be high. Before the muzzleloaders of another official, who was quite alone and had but three or four elephants, there fell, in one morning's sport, three tigers and two rhinoceroses; and only twenty years back a party, not two hundred miles from Calcutta, had the luck to fall in with five tigers in succession in the course of three hours, and to bag them all. This incident was afterwards made the subject of a lively picture, in which the artist, with very pardonable exaggeration, had portrayed the animals as all falling about the same moment; one was lying dead, another growling out his last breath, and a third was seen with his claws fixed firmly on one of the elephants which filled up the fore and the back ground.

Natives, with ancient weapons which are to Brown Bess what Brown Bess is to a modern rifle with explosive bullets, often make wonderful shots and display a coolness which Englishmen would hardly surpass. They also slay their enemies with poisoned arrows, either set in the runs, or fired from some ambush. Now and then they dig pits, and occasionally have been known to surround with nets a small patch of jungle into which a tiger has been seen to retire at dawn of day. The villagers then turn out armed with long spears, matchlocks, and miscellaneous weapons; the tiger is roused by fireworks out of his lair, and is killed or mobbed as he tries to force his way through the meshes. A capital description of a stirring event of this sort is to be found in the pages of the *Old Forest Ranger*. We recollect an official report of the gallant conduct of a policeman, who, finding a tiger inside a cow-house, had the presence of mind to bolt the door, and before the imprisoned animal could make any attempt at escape, he was quietly disposed of by a couple of shots from a gun manufactured either at Monghyr or Birmingham. The cleverest stalk of a tiger by a native was, however, the following. A Shikari saw one asleep under the shade of a large tree on the side of a tank, and found no prospect of getting a shot from the land side. So he had recourse to the following expedient. He waded from the opposite bank, gun in hand above the water, which was breast high, with a long cord fastened to his waist, the other end of which remained in the hands of a confederate on the bank confronting the tiger. When he got noiselessly within twenty paces of the sleeping savage, he delivered his shot, and was immediately jerked violently back under water by his partner. But there was no need of this excessive caution, for one bullet had done the business. Anecdotes of the pertinacity and cunning of the man-eating species of tiger, the terror of a hundred villages, may be contrasted with equally trustworthy stories of his cowardice or indifference when not pressed by hunger. The shout of a herd-boy, or the barking of a dog, has sometimes scared them away. And under the influence of great atmospheric disturbance, the tiger, like Casca's lion in *Julius Cæsar*, has not only been known to "go surly by, without annoying," but has sought refuge in a ryot's hut. In the terrible cyclones of 1864 and 1867, leopards and tigers were seen to crouch during the violence of the wind and water, in close proximity to human beings, like domestic cats.

Not very long since the Indian papers were full of discussions as to the best way of ridding districts of these destructive pests. One writer thought that ten shillings or even one pound for a tiger's head was too little to tempt a native to risk limb and life. Another pointed out that an increase in price only led to deceit and selfishness, and that each individual Shikari, instead of making common cause with others, only studied how to keep the large reward entirely to himself. A third complained that it was perfectly useless to get up a party unless you could include in it some official who would prevail on the villagers to show a tiger's haunts. And a fourth seemed to be of opinion that these fine animals were something like sturgeon or wild cattle at Chillingham, and that they should not be laid low by any less noble hand than one of the ruling race. But the upshot of the controversy has led us to the conclusion that while tigers are, on the whole, a persecuted and a diminishing body, there is no fear that, for some years to come, they may not be found in sufficient numbers to test the skill and reward the perseverance of men who, making light of hot winds and the thermometer in tents at 100°, will rise at 4 A.M. in the month of April, and will not return to camp till 2 P.M., when the sky is like copper, the ground like iron, and the rays of the sun are not felt in their intensity only because the atmosphere is thick and heavy with fine sand and dust.

INACCURACY.

ARE qualities which are the grammatical and logical opposite of one another necessarily inconsistent with one another? In putting our question we have perhaps stumbled on an example which we had not thought of, as the question might well be argued whether a man may not be at once consistent and inconsistent. In the vulgar sense of the words "consistent" and "consistency," there can be little doubt about it. By consistency not a few people mean sticking to the same opinion under all circumstances, the state of mind of the man who, to use Lord Macaulay's alternative, must be either an inspired prophet or an obstinate fool. Such a one, under the cover of consistency, must often be desperately inconsistent. The really consistent man is the man who makes the right inferences from his own principles, who acts according to his own professions. And, to do this, he must very often, with changed circumstances, change both his judgment of things and his own line of conduct. He changes in truth to preserve his consistency; and yet many people will call him inconsistent if he changes. But the paradox here is only verbal; it comes simply of the wrong way in which people use the words "consistent" and "inconsistent." Of course, as usual, the mistake in the use of words implies a mistake as to the nature of things. To call a man inconsistent who changes for good reasons comes of fancying that there is some virtue in mere immobility, in mere keeping to the same ground, whether with reason or without reason. Still the point is only verbal; those who would call a man consistent for so doing would of course not allow that he was inconsistent. But we have turned aside to a mere question of words. It is not about consistency and inconsistency that we wish to speak, but about accuracy and inaccuracy. Some late questions and cases of criticism have led us to some reflections on this point, and specially to the question whether accuracy and inaccuracy can exist together. In a certain sense it is a truism to say that they can. The common imperfection of human nature hinders the most careful man from being perfectly accurate in all times and places. And it therefore follows that the most accurate man is inaccurate in some times and places; that is, he now and then makes mistakes, or, according to the familiar quotation, Homer sometimes nods. But this again is not exactly what we mean. What we mean is whether the habit of accuracy and the habit of inaccuracy may not, in a certain sense, co-exist in the same person. There is one general idea of accuracy, and therefore one general idea of its opposite inaccuracy. But accuracy, and therefore inaccuracy, takes several forms, and the question is whether some forms of accuracy may not be capable of existing alongside of some forms of inaccuracy. We might even go on to ask whether some forms of accuracy may not even tend to promote some forms of inaccuracy.

Of the nature of accuracy we have spoken before now. We need now only repeat a warning against the mistake which confounds accuracy with mere minuteness. Accuracy implies minuteness whenever minuteness is needed; but it is perfectly possible to be accurate without being minute. Accuracy implies that every statement shall be true, clear, and definite, as far as it goes; it is therefore opposed to vagueness as well as to positive untruth. But an accurate statement may be perfectly general, and may go into no detail whatever. Indeed, where detail is not needed, a statement may be said to be all the more accurate for not going into detail. It is a higher feat of accuracy to put a perfectly general idea into words which express all that is wanted, and not more than is wanted, than it is to put together a great number of facts without a mistake. But, where the minute facts are really wanted, then accuracy demands that every one of them shall be correct to the letter. The truly accurate man neither despises minuteness nor makes an idol of it. He is broadly general where a general statement is what is wanted. He is minutely detailed where minute detail is what is needed. But, whether general or detailed, he is always careful that what he says conveys at once a clear idea and a true idea. Details will sometimes make a statement more clear, sometimes less. He acts accordingly. It might perhaps not be too much to say that details sometimes make a statement truer, sometimes less true. In this case he acts accordingly also.

The aim and object of accuracy, therefore, is to give a true and clear statement of the matter in hand, whether the proposition is perfectly general or minutely detailed. We say true and clear, though in a certain sense truth implies clearness; that is to say, clearness is the means by which truth is made to the minds of others to appear truth. A man may be truthful without being clear; but, unless he is clear, others cannot tell that he is truthful. We should not call a man inaccurate simply because he is obscure; but, as long as he is obscure, we cannot say that he is accurate. Clearness then is, as it were, the form, while truth is the substance of accuracy. Inaccuracy therefore involves some kind or some degree of carelessness about truth. It excludes wilful falsehood; for that we have stronger names than inaccuracy; but it includes everything short of wilful falsehood. It stands, in short, in the same relation to wilful falsehood in which manslaughter stands to wilful murder. Manslaughter may be only just not wilful murder, and it may be only just not accident or justifiable homicide. So inaccuracy ranges from those pardonable slips which no man can wholly avoid to misstatements implying an indifference to truth which is highly blameworthy. Inaccuracy is thus carelessness of statement; but it may be carelessness in a very high or a very low degree. It implies that the utterer of the inaccurate statement has not taken so much pains to find out and to set forth the truth as he ought to have done. Theoretically, then, every case of inaccuracy implies some degree of moral blame. But the blame may be so slight that it may be merely theoretical, while it may rise to a degree only just short of the blame due to wilful falsehood. In some cases it may be the result of a constitutional habit of mind, almost a habit of body; in other cases, though there is no conscious falsehood, yet the inaccuracy arises from a practice of trifling with truth. A man may, almost from sheer accident, put a wrong name or date, though he is neither ignorant nor confused. Or he may make the same kind of mistake, not through momentary heedlessness, but through real ignorance. Or he may, whether through heedlessness or through half-knowledge, roll two or three misconceptions together, in which case he rises to the dignity of a blunder. Or he may, whether through mere love of effect or through the partisanship of any theory, have got into a habit of colouring and exaggerating, of turning a thing in such a way that it will look pretty, which implies, which none of the other forms imply, a greater or less degree of conscious carelessness as to the truth.

But the real test of accuracy and inaccuracy is not so much to be found by reckoning the number of mistakes which a man may make as by seeing what he does with his mistakes when he has made them. Theoretically indeed the perfectly accurate man would make no mistakes; but such a perfectly accurate man exists only in theory. Practically it is truer to say that everybody makes mistakes, but that the accurate man finds out and corrects his own mistakes, while the inaccurate man leaves them for other people to find out. In most cases the degree of accuracy, at all events in a book or other writing, depends on the amount—and not merely on the amount but on the nature—of the revision given after the first writing. No scholar would wish to be judged by his first rough draught. It is sure to contain a

good many mere slips; it will most likely contain a good many cases of that not uncommon process when it is good to write down something at once, to make some statement, to form some theory, which it is intended to test afterwards to see whether it will hold water. But, in the case of a really accurate writer, the errors which, through these causes, his first sketch is sure to contain will be got rid of at some stage or other of his revision of his work. Some will vanish when he reads over his manuscript, others will vanish as he corrects his proof. No doubt, even in the case of the most accurate man, a few slips will still escape here and there; but this is no more than the weakness of human nature.

In fact, a really accurate man is best tested by seeing whether he is at once struck by an inaccuracy, whether on his own part or on the part of any one else, when it is set before him. The accurate man is quick in seeing his own mistakes and ready in correcting them; he is equally quick in seeing the mistakes of others and in applying to them that remedy which may be fitting in each particular case. The inaccurate man, whether he be inaccurate through heedlessness or ignorance or any other cause, will pass by the mistakes both of himself and of other people. But here again come degrees and subdivisions. In this matter, as in most others, we find the three classes described in the famous verses quoted by Aristotle. There is the best man of all who sees everything for himself; there is the good man who sees what others point out to him; and there is the worthless man who cannot find out for himself, and who cannot or will not be taught by others. Thus, in our present matter, there is the really accurate man, who sees his own mistakes and corrects them: there is the man who is inaccurate in the second degree, who does not himself find out his own mistakes, but who sees and corrects them when they are pointed out; and there is the higher stage of inaccuracy of the man who cannot see his mistakes when they are pointed out. But this last class again admits of a division, as it takes in two kinds of people between whom there is a great moral difference. There are men who, when a mistake is pointed out to them, thankfully accept the correction, who believe that they understand it, who presently go about to correct the mistake, but whose inherent inaccuracy is such that their well-meant attempts at correction commonly lead to a fresh mistake, often greater than that with which they set out. There are others who, when a mistake is pointed out, stoutly maintain that there is no mistake at all, and who go on to pile up fresh blunders in defence of the original blunder. Both these two classes are intellectually hopeless, but it is only the second who are morally blameworthy. Yet it is of great importance to distinguish between this hopeless class, who can never correct their mistakes, and those who are in that second degree of inaccuracy where correction is quite possible. The position of the two is in every way different, and both great injustice may be done to the men themselves, and real mischief done to others, by confounding the two classes.

It would be easy to name books which abound in inaccuracies of detail, which yet are essentially good books, and which might be made thoroughly good by going through them and correcting each mistake for itself. There are also books which equally abound in inaccuracies of detail, but which the most thorough correction of every particular mistake could not turn into good books. The difference lies in the cause of the inaccuracy in the two cases. In the first it is the mere inaccuracy of heedlessness, which may be set right by revision. In the second case it is the inaccuracy of invincible ignorance or of obstinate perversity, which no revision can set right. Under both classes may be found works of pretension, of reputation, and even of real merit. For it is plain that purely literary merit is quite consistent even with inaccuracy of the second and worst class. In the first class we might name more than one book of high reputation, and which, in the teeth of its inaccuracies, deserves that reputation. The books which we mean read as if their authors had sent them into the world without ever revising their manuscripts or their proofs. If they did so, they were undoubtedly blameworthy. The result is a large amount of positive mistakes, but still mistakes which may be corrected. There are writers who give a narrative, a picture, a comment, the force and truth, and even accuracy of which, as far as the general conception goes, fill us with admiration; yet, when we come to examine it in detail, it is full of inaccuracies in detail. Here is a wrong name, there a wrong title, there a wrong date. As with matter, so with style. There are writers whose style, in its general effect, is clear, vigorous, and noble. Yet, if we pull their particular sentences to pieces, half of them sin against some nicety of grammar. The book reads as if it were the author's first draught, with all the truth and vigour of his first conceptions, but which has not gone through the revision which was needed to make them accurate in detail. Whether lack of revision is really the cause of the fault of course we cannot tell. The mistakes may come from an inaccurate habit of some other kind. Books like these sometimes suggest the idea with which we started, that minute attention to detail at the first moment of composition would have marred the general conception, so that the inaccuracy is in some sort part of the accuracy. Anyhow, the inaccuracies in detail are there, and yet they do not interfere with the general merit, and even with the general accuracy, of the thing as a whole. Whether the fault really is due to lack of revision or to any other cause, it is certain that revision could cure the fault. All that is needed in the case of such books is for the author or somebody else to go through them again and correct every slip in detail. Now we do not defend inaccuracy in this or in any other case. But we do say that inaccuracy of this kind, inaccuracy on the surface, inaccuracy which can be corrected, is a different thing from the inherent inaccuracy which nothing can correct. Books which are inaccurate in this way may be criticized, if any one chooses, elaborately and severely; but it is unfair to criticize them as if the inaccuracy were inherent, as if the inaccuracy were the main characteristic and substance of the work. The brick which is shown is a part of the house, but it is an accidental part, and not a fair sample of the whole building.

In the other cases the brick is a fair sample; the inaccuracy pervades the whole work, and no amount of revision could get rid of it. It is not merely that names and dates and titles are wrongly given; the thing itself is wrong. There are books of repute, books of a taking style, which no amount of correction in detail could make of any real value. Let some reviser go through such a book and alter every particular inaccurate statement. Nothing is gained by his labour; the book itself remains as inaccurate as it was before. It may be merely that the point of everything is missed, that the writer has no accurate conception of his general subject, that he puts this in which is not wanted and leaves out that which is wanted, that he lacks the general knowledge without which accuracy of detail is useless, or rather impossible. In such a case as this, the inaccuracy is inherent; the inaccuracy of detail is only the expression of the deeper general inaccuracy, and this or that particular mistake is a fair sample of the whole book. These are the cases of invincible ignorance, of a misconception as to the main object, in which no improvement in detail can do any good. Yet a writer of this class may often write in a pleasing and attractive way, in a way which makes the "general reader" admire him, and makes him wonder at the contempt with which the scholar looks on his idol. Beyond these again lie the worst cases, where the perversity is moral, where the distinct object of the book is to call evil good and good evil. By a happy dispensation, books of this class are commonly as inaccurate in detail as they are wicked in their purpose: but in such cases mere inaccuracy is a slight matter. There is a certain satisfaction in finding the apologist of evil as full of exhibitions of carelessness and ignorance as of moral perversity; but, in the face of moral perversity, mere carelessness and ignorance might be allowed to go scot free, were it not that both intellectual and moral instruction may be gained by narrowly watching how the greater evil is almost sure to be accompanied by the smaller.

DEATH IN THE PHIAL.

IT has been asserted in various terms by Mathurin Regnier, Lord Shelburne, Mr. Carlyle, and probably by many less famous people also, that the human race consists principally of fools. This is a belief which is the more likely to be generally accepted because each person holding it will be careful to regard himself as one of the minority. In this way one might perhaps arrive at a paradoxical conclusion, that the greater part of mankind was wise because each individual perceived the folly of his neighbours. But the original statement, which by its sweeping nature defies all judicial inquiry into its truth, may easily enough be supported by a large array of facts. If, for instance, credulity were to be accepted as a measure of folly, one could find instances of it springing up on every side as thick as the produce of the dragon's teeth. The imaginative faculty, which in its highest development makes poets, painters, and musicians, men who are constantly striving after something fairer than can be given them by the narrowed capabilities of earthly life, is found in its crudest form among the mass as the love of the merely marvellous. And, when once this is indulged in, it ends by asserting an irresistible sway over those who give themselves up to it. It seems to have an intoxicating effect which destroys all chance of sober judgment. We remember a striking illustration of this at a mock Spiritualistic séance, where a feat of clairvoyance was exhibited. This was to be accomplished by a code of signals between the "medium" and the "subject"; but the use of the code became unnecessary, as the bystanders who had come with the express intention of making a cool and critical inquiry discussed every object which was to be seen by the clairvoyant loudly and openly among themselves, and thus saved him all the trouble of attending to the signals. It is the same readiness and even desire to be on familiar terms with the unexpected that keeps alive many swindling tricks which one might hope to have seen worn out by this time. It is the strange coincidence, as he thinks it, of meeting a genial fellow-countryman in the wilds of London which takes possession of the victim's mind in what is known as the confidence trick, and renders him an easy prey.

One of the best examples of the widespread credulity which craves for some kind of mystic interference with the ordinary course of nature is discovered in the popularity of quack medicines, the proprietors of which make fortunes by trading on the superstition of mankind. For the feeling of awe with which the inhabitants of a small village regard the doctor's surgery is just as superstitious as that with which they pass in fear and trembling the dark archway where from time immemorial a spectral form has been wont to appear. And the same feeling leads them, in the absence of a doctor, to exhaust their boundless capacity of belief on the virtues of some nostrum which professes to cure with a few applications every variety of disorder to which the human race is subject. It is a common notion among the uneducated classes that no remedy against disease has any merit unless its effect is strongly marked, and doctors in such small villages as we have spoken of

frequently find it advisable to employ some unnecessary but harmless drug of which the patient shall perceive the effect in order to make him believe in the cure which had taken place already. It is easy to guess what influence the knowledge of this fact has upon the makers of quack medicines, who are less scrupulous as to the nature of the ingredients with which they attain their object than the village doctor. But it is not only among the poor that patent medicines find a large acceptance. There are thousands of educated people to whom the state of their own health is a source of never-failing interest and excitement; to whom the overthrow of empires is as nothing compared with the fancied derangement of their livers, and to such people the existence of patent medicines affords a constant means for fanning the fire of self-torment. They have long since lost all belief in doctors; but they are continually acquiring and losing belief in all kinds of quackeries. One day they are raised to the height of bliss by the discovery of some concoction which will ensure them happiness for the rest of their lives; the next they are in despair at their folly for having employed a remedy so evidently ludicrous, and are on the look-out for one yet more ridiculous, which they will in the same manner take up and reject. These persons are a nuisance not only to themselves, but to all their acquaintance, whom they pester with detailed accounts of their symptoms, and recommendations of their favourite specific for the time being. It is not to these people, however, that the existence of patent medicines under their present conditions is likely to do great harm. If there were no such things they would make themselves happy, after their miserable fashion, by over-doses of ordinary drugs. But on a large class of the community there can be no doubt that the sale as now conducted of patent medicines has a most pernicious effect.

It may be well here to recognize the fact that there are certain medicines of this kind, such as James's Powder and others, which have long been accepted as valuable by physicians. It is not of these, but of the vast number of quack nostrums which are advertised, and, incredible though it may seem, believed in, as panaceas, that we wish to speak. There are pills and ointments without number, "life" or "health" mixtures, self-styled specifics against feverish attacks, and, above all, opiate draughts, of which the ingredients are far from being so harmless as they profess. There is one popular effervescent mixture which is, it must be said, of a tolerably harmless nature, of which the label sets forth that it is in valuable in all cases of slight derangement, and (there is an audacity about this which is appalling) recommends that in cases of yellow fever the dose should be slightly varied. There are quantities of cough lozenges which are in especial request at this time of year into the composition of which morphia enters largely. There are soothing syrups and powders with which infants are quieted, occasionally for ever, and there are various draughts of the same nature with which grown-up people procure an imitation of the natural rest which they have bartered away for life at high pressure. These too have been known not unfrequently to act with only too much effect. Several of these preparations are made up with active poisons, and almost all are composed of materials which, if not actually poisonous in themselves, become little short of poisonous when taken recklessly, as they are. And for the sale of these things there is an absolutely open market. You may see them in the windows of half the odds-and-ends shops in town and country. It is a curious fact, which may be noted by the way, that a considerable trade in laudanum is driven by small country shoemakers, between whose normal and irregular occupation it is difficult to see any connecting link. There are two medicines, Chloral and Chlorodyne—of which the latter is a patent medicine—that have come into nearly universal use. Both these medicines, no doubt, may be beneficial when applied under proper skill and direction. But the case is widely different when they are applied in absolute ignorance. And that they are so applied in hundreds, or even thousands, of cases there can be no doubt. An unwise or exaggerated use of such powerful drugs as these is every bit as poisonous in its effect as a smaller dose of prussic acid would be. Yet over the sale of the one product a tight and discreet hand is kept; while that of the other is as free as air. Even in the smallest doses the unskilled use of such powerful remedies is dangerous; a variety of diseased conditions may render that fatal which to a healthy man would be innocuous; and thus the sufferer from overtaxed nerves or brain, who fondly believes that he is purchasing sleep and rest, may be really buying his death. It is also to be observed that those who are once tempted to the employment of such drugs as these are liable to take to them as others take to tippling. And, unfortunately, the one amusement is as legal as the other.

One cannot help thinking there must be something wrong in the state of things which permits this unrestricted traffic in deleterious drugs, and that the legislation which is supposed to provide for the safety of the people must require amendment. One section of the Pharmacy Act provides that it shall be unlawful for a chemist to sell, except under restrictions and with precautions of entries made in a book kept for the purpose, any of the poisons named in the first part of schedule A attached to the Act. But among the poisons not named in that schedule are oxalic acid, chloroform, opium, and belladonna. This is perhaps less singular than the fact that another section provides that "nothing hereinbefore contained shall extend to or interfere with the making or dealing in Patent Medicines." This surely in great measure nullifies the first provision of the Act, that "it shall be unlawful for any person to sell or keep open shop for retailing, dispensing, or compounding poisons . . . . unless such person shall be a Pharmaceutical Chemist, or a Chemist and Druggist within the meaning of this Act." It amounts, in fact, to giving with one hand a special privilege to recognized chemists for dealing in poisons, and taking it away with the other. Practically any one who pleases can deal in poisons, so long as they are disguised under the name of patent medicines. No doubt there is something to be said in favour of such medicines, some of which, as we have already said, are really valuable. But it ought not to be impossible to ensure their all being, if not positively useful, comparatively harmless. There seems, indeed, no insuperable objection to adopting the French plan of having every such medicine submitted to an accredited body before its sale can be lawfully carried on. At least it might be arranged that directions as to the quantity of such medicines likely to have a harmful effect should be printed on every bottle containing them. If people chose to disregard such directions, they would have only themselves to blame. If the ingredients of a preparation supposed to be universally beneficial were announced publicly, of course the element of mystery which constitutes its great attraction would vanish. It is certain that, as things stand, a trade is largely carried on which, under the colour of increasing health, does very much to generate disorders, and carries with it not a little danger. English people have a mania for dosing themselves. Where a Frenchman would apply some such mild remedy as a "lait de poule," or a glass of harmlessly medicated lemonade, an Englishman will be content with nothing short of a strong pill or draught. But is it too much to expect that a benevolent Legislature should provide for its subjects indulging in such a folly as this with the least possible danger to themselves?

UNDERGRADUATES AND MONEY-LENDERS.

THE life of undergraduates is much the same as it always was, and if the name of "Sunday Tattersall's" did not exist formerly at Cambridge, the substance of the thing was there. It is wonderful that young men who in a few years become capable of dealing with the practical realities of life should show themselves from eighteen to twenty-one, we will not say vicious, but weak, silly, and almost idiotic. They are like our old friend the working-man, who cannot pass a public-house on his way home without taking a glass of beer or gin. The most wild and improbable designs that ever were fabricated in cotton or wool can be passed off by a University tailor on his customers as neat things in waistcoats or trousers. We have heard that the celebrated pattern which took two men to show it was very nearly sold to a quiet reading-man at Trinity; and he would have given the order if he had not happened to look up and see in a glass a reflected smile on the face of a friend who had accompanied him into the shop. It was, we believe, a "Johnian" who called upon his tutor wearing a white shirt adorned with pink figures of a ballet-girl standing on one toe. Undergraduates wear the most hideous pins and studs, drink the vilest wine, and smoke the most execrable cigars, and it is inexpressible what "screws" they ride. We could almost forgive the money spent in riding or driving, although often it can be ill spared; but the taste for smoking, drinking, and wearing loud dress and trinkets is despicable. Sometimes they hang about their own necks a weight which they must wear for years. Sometimes parents, sisters, and younger brothers suffer for young hopeful, who was to have taken a good degree, and goes a more particular "mucker" than his associates. The story of Mr. Linklater and his son has been told many times before. The son borrows money which the father pays, warning the lender that he will not pay again, and the borrower that parental displeasure will follow a return to the evil way. But, whatever sons may promise or fathers threaten, the money is usually lent, and in the long run paid, and thus the picture may still be painted in the old familiar colours. There is idling, gambling, dress, drink, and dissipation.

Impositique *regis* juvenes ante ora parentum.

The plaintiff in the case which has excited so much attention stated that he first became acquainted with the defendant by seeing him at sports and races. When he first borrowed money of him, in December 1868, the defendant asked him whether he was of age, and he told him. He also told him what his income was. It appears that he had an allowance from his father of 300*l.* a year. His father came to Cambridge in April 1869, and saw the sister of the defendant, who was absent from home. His father "was very angry," and showed the certificate of his age, saying that he would pay the money then claimed sooner than it should come to the knowledge of the authorities, but he prohibited further advances. This account can hardly be otherwise than substantially correct, because Mr. Linklater senior must have had some object in speaking to the defendant's sister, and, in connexion with the subject of advances to his son, he would naturally refer to his son's age; and, whether he produced a certificate or not, the defendant, as a man of business, would know that Mr. Linklater was not likely to be mistaken on this point. The plaintiff proceeded to state that after this "he was hard up again, and applied to the defendant to make him another advance; and the defendant said he did not care to do so after what the father had said." The plaintiff said "he was sorry for his father's roughness," and in the result the defendant made him an advance of 37*l.* 10*s.*, on a note for 50*l.* payable in six months. In May he was removed from the Uni-

versity, and his father's notion that "he was doing no good there" was undoubtedly correct. In 1874 the defendant brought an action against him, which was stopped by the plea of infancy, and in November last he was charged before magistrates at Cambridge with obtaining money from the defendant by the false pretence that he was of age. The charge was dismissed, and he now brought this action against the defendant for malicious prosecution. Without entering into the conflict of evidence between the two Linklaters on the one hand and the defendant and his sister on the other, we may remark that it is highly probable that Mr. Linklater senior did say something to the sister as to his son's age; and, whatever may have passed afterwards, the defendant ought to have believed the father on this point. The lapse of time before the defendant brought his action to recover the money was of course used as an argument against him; but we do not think much of that, as these actions are not usually brought until there appears to be some chance of obtaining payment. After the criminal charge had been dismissed by the magistrates, Mr. Linklater's counsel undertook that the amount of the loan should be repaid, with interest at five per cent., and it was paid accordingly. The defendant's counsel insisted at the trial that this was a compromise of the whole matter, and that the bringing of the action was a breach of an honourable understanding; and this view is, to say the least, plausible. It may be answered, however, that as the plaintiff had undoubtedly received and spent the defendant's money, he or his friends may have felt bound to refund it, and may have done so without intending anything like a compromise. Nevertheless, the course of proceeding at Cambridge, as reported by a local newspaper, was remarkable. The magistrates consulted, and the Mayor said the case must be dismissed. Then the prosecutor by his counsel applied to be bound over to prosecute, and the Mayor, admitting that this application was legal, asked whether it was advisable. Then the counsel consulted with his client, and said that he would not press the application, which, we may remark, was certainly useless, as no grand jury would have found a bill upon such evidence. Then Mr. Linklater's counsel said "he thought the best plan would be that an end to the matter be arrived at now" by his client repaying the money lent, and he would take care that was done. The money was accordingly paid, and a few days afterwards an action was brought for maliciously and without reasonable cause putting the criminal law in motion.

Subject to this question of the alleged compromise, the case was tolerably clear. If the plaintiff made a false representation as to his age, and if the defendant believed it, and was thereby induced to advance money to the plaintiff, then there was reasonable ground for instituting a prosecution; but otherwise not. If there were reasonable ground for the prosecution, then, although the defendant may have instituted it maliciously, that is, with the object, not of vindicating public justice, but of injuring the plaintiff or extorting money from him, still the defendant would not be liable in this action. In many cases prosecutions supported by good evidence have been instituted out of spite; and the law requires both malice and the want of probable cause to support an action. But if a prosecution is shown to be groundless, a jury will be apt to infer that it is malicious, and, in this case, assuming the general truth of the plaintiff's story, there could be no doubt that he was entitled to a verdict. But upon the question of damages the view taken by the jury of the alleged compromise might be important. After nearly an hour's deliberation they gave a verdict for 100*l.*

The tradesman has a better chance of getting payment than the money-lender, because he may allege that the goods he supplied were "necessaries," and if a jury of tradesmen were allowed to decide the question, they would very likely find in his favour. The Courts, however, have recently inclined to limit the jury's power in this matter, and the modern doctrine is that, unless there is evidence on which the jury might reasonably find that the articles were necessaries, the question whether they were necessaries ought not to be submitted to them at all. The two Universities have contributed about equally to the elucidation of this head of law; but in the most recent case the defendant was merely an idle young man, younger brother of a baronet, and moving "in the highest society." The articles supplied were a pair of wrist studs, called, we believe, solitaires, in which diamonds and rubies were combined in the elegant form of a horse-shoe, at the price of 25*l.*, and a silver-gilt goblet intended for a present to a friend. The question, said a learned Judge, was not whether it was necessary that the defendant should give a silver-gilt goblet to a friend, but whether it was so necessary that he ought to buy it on credit sooner than not have it at all. After much debate it was decided that, as regards these articles, the Judge ought to have decided against the claim without allowing the jury to pronounce upon it; and this decision is likely to be useful in checking the disposition of tradesmen to give credit. In another recent case, the Court held that tobacco and cigars could not under any circumstances be necessaries, and therefore there could be no question for the jury. The same decision was arrived at on a claim for dinners supplied to an undergraduate of Cambridge in his rooms, and the reason was that, as a dinner was provided for him daily in the Hall of his College, he could not want another. Formerly the practice was to get from the young man on his coming of age a written acknowledgment of the debt incurred by him during minority, and thus to get rid of the question whether the articles supplied were necessaries. But a few years ago an Act of Parliament was passed invalidating these acknowledgments; and this, as far as it went, was a useful measure. The tutor of a College has some control over his pupils, and some over the tradesmen of the town, or at least so many of them as think they can get more out of the favour of tutors than by defying them. Bills are sometimes paid by parents to shelter their sons from rustication or other penalty of extravagance, just as Mr. Linklater paid the amount of the first advance to his son; and many bills are paid by the young men themselves when they come of age. It used to be said that the tradesmen of Cambridge were pretty good judges of what place a customer would take in the tripos, and regulated the amount of credit given to him accordingly. On the whole, it may be thought that these tradesmen do tolerably well. The majority of their customers pay them, and the prices charged are high enough to cover occasional losses. Even in the recent case it appears that the lender would have got his money back with five per cent. interest if he had not been so foolish as to take criminal proceedings. Mr. Linklater did, in fact, pay this money, and, as he repudiated the idea of a compromise of the prosecution, he must have paid it because his son, or his son's friends, or society, thought, or were supposed to think, that it ought to be paid. It is easy to call these money-lenders "pests and nuisances," but if they get their profit they won't mind a few hard names.

THE FALL IN SILVER.

THE fall in the value of silver has at length gone so far as to compel the Government of India to take steps in the matter. With our usual indifference to purely Indian questions, the depreciation of silver has hitherto excited singularly little attention amongst us. It is not so with our neighbours. In France, Germany, the United States, Italy, Belgium, and Holland, and even in Switzerland and Greece, the fact has for some years back been the subject of much anxious discussion, while it is impossible to turn over a file of Indian newspapers without coming upon so many references to the question as leave no room for doubt concerning the wide general interest it arouses; but in this country the matter is hardly ever treated outside the journals specially devoted to politico-economical speculation, and the money articles of the daily press. Yet the question is one of the most real practical importance to our Indian Empire, and, accordingly, a Committee of the House of Commons has been appointed, on the motion of Lord G. Hamilton, to inquire into the causes of the depreciation, and to consider the remedies to be adopted. The currency of India, as every reader is aware, is a silver currency; consequently, all taxes are received in silver, and all salaries are paid in the same metal, as are, of course, likewise all purchase-moneys and debts of every kind. But our own currency is gold, silver being with us merely token money. When, therefore, a payment has to be made in this country by any one in India, it has to be made in gold. But silver has fallen so much as compared with gold that the Indian resident incurs a very serious loss on changing his rupees for sovereigns. The Government of India has to transmit to this country annually, to pay interest on debt, salaries, and pensions, to purchase stores and materials, and for various other purposes, about 15,000,000*l.* Now the new Viceroy told a deputation from Manchester a fortnight ago, that on every rupee thus transmitted the Indian Government loses threepence, or one-eighth; so that its loss on the 15,000,000*l.* amounts to 1,875,000*l.* This sum is more than twice the amount of the import duties on cotton; consequently, if it could be saved, not only might those duties be taken off, but there would remain a substantial balance to aid in the adjustment and reduction of other duties. Or, if a more cautious course were adopted, the Indian Government would be in possession of a real surplus, to serve as an insurance against periodical famine and against any diminution of the opium revenue, as well as to furnish a reserve fund in case of war. This is the way in which the question affects the Government. It presses even more hardly upon the civil and military services, and upon the servants of the Indian Railway Companies. Let us suppose that a member of the Civil Service, after spending the best years of his life in the performance of trying and arduous duties, has saved 24,000*l.*, and that, when about to come home, he transmits his savings for investment. According to Lord Lytton he would lose one-eighth of the amount, or 3,000*l.*, which at no more than four per cent. would be a loss of 120*l.* a year. The depreciation of silver, therefore, is tantamount to a reduction of salary, so far at least as savings are concerned, and remittances home, whether to children at school or for any other purpose. Lastly, Englishmen trading with India suffer in the same way. It is universally found that, when a currency is undergoing depreciation, the fall of value is more rapid than the rise of prices. It was so in the United States during the civil war, and it is so in India now. Consequently, when the English merchant sells his goods in India, he gets a nominal price but little in advance of that which he would have got some years ago. But the rupees in which that price is paid are no longer worth as much gold as they were formerly. This is one of the reasons of the unprofitableness of the export trade to India of which we hear so much.

The causes of the depreciation are not far to seek. Silver, like all other commodities, obeys the law of demand and supply. When the demand falls off and the supply increases, the value of the metal sinks. This is what is occurring at the present moment. In California and the territories beyond the Rocky Mountains extremely rich silver mines have of late been discovered. Those mines have already yielded large quantities of the metal, and in

the near future they are expected to prove still more productive. From the reports of the Commissioner of Mining it appears that between the years 1848 and 1860 (both inclusive) the greatest production of the silver mines of the United States in any one year was 30,000*l.*, and in eleven out of the thirteen years it did not exceed 10,000*l.* In 1864, for the first time, the yield exceeded a million sterling; in 1870 it exceeded three millions; in 1873 it reached seven millions; and last year, though the figures are not accurately known, the yield is believed to have been as great. Last summer additional mines were discovered, and the prediction is hazarded that, should the demand hold good, there will be produced within the next five years more silver than has been turned out between 1848 and the present time. In the meanwhile Germany has adopted an exclusive gold standard, and is rapidly demonetizing her old silver coins. From statistics published by the Berlin Government we learn that previous to 1871 the silver coined by the various German mints amounted to, in round numbers, 68,000,000*l.* sterling; the new silver coinage is to amount to 21,000,000*l.* sterling. There will remain, therefore, a balance of 47,000,000*l.* to be called in and sold by the German Government. Some of this has of course been exported, melted down, and lost; but at any rate the sum to be disposed of by the German Government must reach to between thirty and forty millions sterling. Add this amount to the production of the American mines, and we see how enormous has been the increased supply of silver which since 1871 has been thrown upon the markets of the world. It has caused a glut; and, as a natural consequence, has run down the value of the commodity. At the same time Holland also has adopted a gold standard, and so has Japan. The monetary policy pursued by Germany, Holland, and Japan has had another effect; it has restricted as well as glutted the silver markets. Formerly those countries required silver to keep up their currency; now they not alone have no demand for the metal, but are selling it. And, at the same time, most of the great countries of the world—France, Austria, Russia, Italy, the United States—have a forced paper circulation, and therefore have but a slight demand for metal. By the Resumption Act of last year the United States adopted the gold standard; there, accordingly, the demand for silver must continue small. And the countries of the Latin Union—France, Italy, Switzerland, and Belgium, with Greece—have by their monetary convention, which has been annually renewed for three years in succession, restricted within very narrow limits the quantity of silver which it is lawful to coin. Thus the demand for silver upon every hand has diminished simultaneously with the increase of supply.

The remedy usually recommended in our own case for the evils we have pointed out is the adoption in India of a gold currency. It is estimated that about 100,000,000*l.* would suffice for that purpose; and even if the whole amount had to be obtained by means of a loan, it is urged that that would entail a charge of not more than 4,000,000*l.* or 5,000,000*l.* a year. But we have seen that already India is losing nearly 2,000,000*l.* a year, and the depreciation has certainly not yet reached its limits. Besides, the country is losing in other ways. Every Railway Company in the Empire, for example, loses equally on the dividends it pays at home and the purchases it makes. Therefore, it is argued, even if India had to borrow the whole amount, it would not lose by the transaction. But it would not have to borrow the whole amount. For at least half the existing silver currency could be called in and sold. Still that would, no doubt, involve a great loss. Already the depreciation of silver is twelve and a half per cent., but if the Indian as well as the German market were closed, there is no saying where it would end. This is the first objection to an Indian gold coinage. India and China are now the only countries where there is an effective demand for silver. If India becomes a seller instead of a buyer, it is clear that she could dispose of her silver only at an enormous loss. To this, however, it is replied by the advocates of the measure, that if France follows the example of England, Germany, and the United States, and adopts a gold standard, the depreciation of silver will become so extreme as to compel India to do so likewise, and that then her loss will be much greater than it would be now. There is indisputable force in the argument. But it is objected on the other side, that if India adopts a gold standard, the demand for gold will become excessive. Since 1871 the German demand alone has kept the money markets of the world in perturbation. According to the existing law, the United States will resume a gold currency in 1879. If France and India do the same, gold will, it is argued, become as scarce as silver is over-abundant; trade will degenerate into a game of speculation; for no man can tell what the value of money will be two months forward, and we shall have panics with the bank-rate at ten per cent. It may be replied that the policy of India ought to be determined by the interests of India, not by the convenience of other countries. And this is true; but it must not be left out of sight that India would suffer quite as much as other countries by such a disturbance of international monetary relations as is here pointed at. We have but to look at Germany to see how difficult is the task of changing the money of a great country. At the end of five years the operation is not completed, while the trade and industry of the Empire are seriously suffering. Lastly, it is argued that the evils under which India is now suffering will gradually right themselves. The fall of value will check the production of the American mines, while the sales by Germany must, as a matter of course, soon come to an end. The supply will then cease to be greater than the world can absorb. In the meantime prices in India will gradually rise so as to adapt themselves to the altered value of the rupee, and when this adaptation is effected the import trade will be as profitable as ever. Lastly, if France resumes specie payments and retains the double standard, the field of employment for silver in Europe will be restored to nearly its normal extent. These are the leading arguments for and against the adoption of a gold currency in India. It will be for the Committee obtained by Lord G. Hamilton to examine their relative weight.

A NICE IRISH SESSION.

A CERTAIN number of Irish members in the House of Commons have just hit upon an ingenious argument in favour of relegating them to a House of their own on the other side of St. George's Channel. They seem to have resolved to play the part of the hedgehog at Westminster, and to be bent upon making that body as uncomfortable as possible until they get what they want. The plot seems to have been hatched before the opening of Parliament, and on the very first day it began to be put into execution. The Home Rule members, every man of them, have put down Bills in the list, and the greater part of the Session has already been booked for Irish business. There is hardly a Wednesday or other open day to be had for anything else. One of the tricks by which they have accomplished this triumph was brought before the House on Thursday in a question to the Speaker, who was asked by Mr. Ritchie whether it was in accordance with the practice of the House that several members should, by agreement among themselves, enter their names on the Notice Paper with the view of giving notice of one and the same motion, in order that such motion might be proposed by any of the members whose name was first called, and thereby obtain undue priority. The Speaker replied that the practice described was practically an evasion of the rule of the House, and if persisted in, might have to be checked by requiring each member on entering his name on the Notice List to state the subject-matter of his motion. He added that, if any irregularity had occurred, it was only through inadvertence, and that the House might rely on the good sense and right feeling of members for the faithful observance of its rule. Nor is this all. In the small hours of Tuesday morning the House of Commons was treated to an impressive lesson of its helpless dependence on the good will and civility of Irish members. It was kept out of bed till nearly five o'clock in the morning in order that Major O'Gorman and his colleagues might show their contempt for the amenities of Parliamentary life, and their determination to make their presence felt in a particularly offensive manner. In this project these gentlemen are no doubt in many respects eminently qualified to succeed, for they unfortunately have it in their power to cause a grievous delay of public business. Whether they will persevere in this course remains to be seen; but there can at least be no mistake as to the amiable intentions with which they have begun the Session, and, judging from Major O'Gorman's behaviour, they are quite capable of going on to the end. On the morning in question no fewer than seventeen successive divisions took place in the House of Commons between a quarter past one and a quarter past four. The occasion was a motion for the appointment of twenty-one members as referees on private Bills. Mr. Sullivan, Captain Nolan, Dr. Ward, Major O'Gorman, and other Irish members complained that the representatives of their country were overlooked in making these appointments, and a threat was made of dividing the House on every name on the list. The first division was taken on an amendment by Mr. Sullivan that the Committee should consist of twenty-three members — the number proposed being twenty-one, of which two were Scotch and two Irish members—which was defeated by 73 to 21. The names were then taken in order, and the first name was Mr. Walpole's, for which there were 79 ayes against 11 noes. In the next case there were 77 ayes against 11 noes, and in the next the minority was reduced to 10. Major O'Gorman rose to express in his usual lucid manner his sense of the "scandalous" conduct of the Government in not giving way to the Irish members, for which he was called to account and ordered to withdraw the expression. The Chancellor of the Exchequer explained that there was no desire to exclude Irish members as such from holding the appointments in question; the only object was to get the members who were most competent to discharge the important and responsible duties of referees, and naturally men with special experience on such matters were preferred. Other members pleaded for at least an adjournment of the debate. Major O'Gorman, however, was obdurate, and the divisions went on, the minority gradually declining as one by one those who belonged to it became ashamed of their conduct, and fell out or went over to the other side. When the minority fell to eight, even Mr. Sullivan became susceptible of this feeling, and protested that the divisions had been carried far enough. In the last series of divisions the ayes were 75, while the noes had dwindled to 3; the noble trio who thus distinguished themselves being Mr. Dunbar, Captain Nolan, and Dr. Ward, with Major O'Gorman and Mr. Parnell as tellers. At last the list of names was exhausted, those of the two Scotch and two Irish members being allowed to pass without question; and it was about a quarter past four in the morning when the House adjourned. It is easy to conceive that, if this method of political contest is

systematically carried out by the Irish Home Rulers, a fervent desire might be created among the rest of the legislative body that Irish members should stay at home.

It is well known that the comprehensive and urgent duties of the Government require that it should have a large share of the time of the House of Commons, and that what are called private members are consequently sadly hampered in finding opportunities for bringing forward Bills, or calling attention to subjects in which they take an interest. It would appear, however, that during the present Session, any time which is not occupied by the Government is to be monopolized by the Irish members, who are prepared to propose a general reconstruction of everything in Ireland down to the most microscopic of its institutions. We find, for instance, on the Orders of the House the following list of Bills relating to Ireland. Mr. Henry wishes to amend the law with reference to the registration of Parliamentary voters in Ireland. Mr. Dunbar thinks he could improve the law relating to Union rating. Major O'Gorman has a plan for improving the Irish municipal franchise. Captain Nolan has a Bill for the establishment of County Boards in Ireland. Dr. Ward has taken up the question of the regulation and management of the coast and deep-sea fisheries of Ireland. Mr. Butt offers a Bill for the amendment of the law with reference to tenure of land, and another Bill with regard to University education. Mr. Parnell would like to see some changes in the law as to the reclamation of waste lands in Ireland. Mr. Biggar is desirous to assimilate the borough franchise in Ireland to that of England. Mr. Ronayne proposes legislation with regard to grand jury levies, and the establishment of Representative Councils in Irish counties for the management of local affairs. Mr. Downing has ideas about the removal of Irish paupers from England and Scotland to their own country which he is anxious to get embodied in an Act. Mr. R. Smythe has a Bill to prohibit the sale of intoxicating liquors on Sunday in Ireland; Mr. M. Brooks, one with reference to Irish municipal corporations; Mr. Crauford, one to amend the Landlord and Tenant (Ireland) Act of 1870; Sir J. McKenna, one to deal with the rating of towns; Mr. Downing, one about grand juries; Mr. Sullivan, one with regard to coroners in Dublin; and Mr. Meldon, one to alter the constitution and government of county infirmaries in Ireland. There are probably other Irish Bills which we may have overlooked, and which are yet to come; but it is evident that there is plenty of work already cut out for the House of Commons, and that the Parliamentary debates will consist chiefly of discussions on Irish subjects. Besides these Bills, there are notices to call attention to various questions—such as intermediate education, National School teachers, the Irish Society, and that momentous subject, the blending of Irish with Scotch whisky, which, in the eyes of true patriots of the former country, is of course a most atrocious kind of adulteration. Mr. Butt has a motion for a Select Committee to inquire into and report upon "the nature, extent, and the grounds of the demand made by a large proportion of the Irish people"—an assumption likely to be questioned—"for the restoration to Ireland of an Irish Parliament, with power to control the internal affairs of that country." It is possible that, among other points submitted to the House, it may be intended to direct its attention to the question how, if Irish members are to occupy the whole time of the British Parliament, the affairs of the rest of the United Kingdom are to be carried on.

It will of course be indignantly denied that all this sudden accumulation of Irish business has been devised simply for the sake of wasting time and showing that the Irish members have it in their power, if they choose, to embarrass and annoy the House of Commons, and perhaps on some critical occasion to bring it to a deadlock. Even, however, if we suppose that the course they have adopted has been dictated solely by motives of the purest and loftiest patriotism, and a conscientious belief that Ireland is really urgently in want of all this legislation, a little reflection will show that conduct of this kind is hardly calculated in the long run to promote those feelings which are most favourable to Irish interests. At the first glance it may seem that the more troublesome any set of representatives can make themselves at Westminster, the greater would be the temptation to get rid of them by allowing them to set up a Parliament of their own; but this is rather a short-sighted view, inasmuch as the temper of Irish members while a part of the British Legislature would naturally be taken as a test of the spirit in which they would be likely to act as an independent body. Moreover, though it is possible for a small number of members by sharp practice or perverse disregard of public convenience to snatch an occasional surprise, the House of Commons has after all the means of protecting itself against any systematic attempt to waste time and obstruct the general administration of the country. It will be remembered how last Session an Irish member spun out a speech by endless quotations from books, and it may be feared that the expedient will be repeated. An Irish Bill, however trifling, almost invariably occupies more hours than any other business; so that a multitude of Irish Bills is really a serious difficulty. The forms and orders of the House of Commons are of a very delicate and artificial character, and are based on the assumption that all the members are equally anxious to maintain order and promote dispatch of business and mutual convenience. A small group of unmannerly members is quite sufficient to make a formidable obstruction if it chooses to act in concert in a particular way. Everybody knows what an eel is in a water-pipe; and it is only because there is a prevalence of good feeling and gentlemanly courtesy among the great body of members that the business of the House is got through at all. Any one who watches the proceedings must have observed how—as, for instance, on the question of the exclusion of strangers—a departure from the ordinary course at once causes a confusion which it is difficult to set right. So delicate a contrivance as the machinery for maintaining order in the House of Commons ought to be jealously guarded against rough usage. Nothing could be more unfortunate than that those who endeavour to obtain an unfair hold on the House should be met with reprisals in the same spirit; but of course, if real necessity should arise, the House will be able to express its sense of the annoyance to which it may be subjected. Great allowance must be made for the exigencies of a political agitation which requires spirited advertising in order to keep up the flow of subscriptions; but it may be safely assumed that there is a majority in the House of Commons on the side of order and amenity.

THE CANADIAN MILITIA.

AT a time when general attention is turned towards military subjects, and to the means which, in the event of hostilities, would be available for the protection of the Empire, a Report on the condition of the forces of our most powerful colony cannot fail to excite interest. Since the withdrawal of the Imperial troops, the burden of providing for her defence has fallen entirely on Canada; and, being both unwilling and unable to maintain a standing army, her Government has devoted the small amount of money at its disposal to the organization of a Militia. This force has been placed under the command of an Imperial officer—Major-General Smyth—who, having made a tour of inspection over a distance of eleven thousand miles, of which two thousand were performed on horseback, submits his Report to the Dominion Parliament.

To many readers the most interesting part of this Report will be that which deals with the vast territory lying between the province of Manitoba and the Rocky Mountains, and drained by the Saskatchewan and its tributaries. This country, described by Captain Butler as the Great Lone Land, appears to be awaiting the settlers who, when means of communication have been rendered more complete, will probably make it their home. In the meantime the Indian tribes continue to hunt over those parts which the buffalo has not deserted, and claim the protection of the Government against the adventurers who, as whisky traders, threaten them with demoralization and destruction. To make the arm of the law felt in those distant territories, a force of three hundred mounted constabulary was recently organized, and General Smyth was directed to report on their efficiency and on the effect produced by their presence. His Report, we are glad to say, is eminently satisfactory; the illicit trade in spirituous liquors, with its attendant evils, has been stopped; and the Blackfeet Indians—the most warlike of the Canadian tribes—have been the first to acknowledge the benefits they derive from the withdrawal of the temptations which, whilst unable to resist, they clearly recognize as the precursor of ruin and of death. Their chiefs held a conference with General Smyth at the foot of the Rocky Mountains, and after expressing their satisfaction at the security afforded them by the presence of the mounted police, requested him to represent to the Government their wishes for the conclusion of treaties for the allotment of land similar to those accorded to the Eastern Prairie Indians.

So far all promises well, and the friendly spirit in which the officers of the United States army across the border met General Smyth, and their evident desire to promote arrangements conducive to good order on the frontiers, afford an additional hope for the preservation of peace throughout the hitherto lawless regions of the Far West. It would be a curious subject for speculation to prognosticate the components of the future population of these regions. Icelanders, and Mennonites from Southern Russia, are already cultivating farms in Manitoba; French Canadians, half breeds, and Scotch servants of the Hudson Bay Company congregate round the old trading posts; whilst at Kootenay Pass, in the Rocky Mountains, a Chinese settlement claims protection from the Canadian authorities. The presence of the police and of their horses necessitates the cultivation of cereals, and especially of oats round their several barracks, and will lead to trade which will gradually people the wilderness, whose soil, climate, and mineral productions appear to invite the settler. Surveys have already been made, and the frontier has been marked out, although the buffalo by knocking down the pillars carefully placed by the engineers will, unless checked, do much to destroy the fruits of their labour.

A ride across country from Manitoba to British Columbia was, however, only an incident in General Smyth's tour of inspection. The gist of the Report deals with the present condition of the Militia force on which Canada relies for protection against foreign foes, and for the maintenance of good order within her extended territory. This force is called out annually for twelve days' drill, and the numbers so trained amounted during the last year to nearly twenty-nine thousand, half of which were furnished by Ontario. The General speaks highly of the intelligence, the physical qualities, and the aptitude for military duties of both officers and men, although he points out the almost impossibility of attaining a sufficiently high standard of efficiency, or even of preserving from damage and destruction the arms, accoutrements, and clothing of the force, without some permanent and educated

regimental staff. He had previously recommended a paid adjutant for each battalion; but as this proposition did not find favour with those who control the national purse, he has reduced his request to a sergeant-major, who would also act as storekeeper. He also advocates training-schools for cavalry and infantry, as well as increased inducements for officers to pass through the shorter courses at the Artillery Schools at Quebec and Kingston. The Military College at the latter place is still in embryo, the Superintendent, Lieut.-Colonel Hewett, being the only officer who has actually received his appointment. It is to begin on a very modest scale, only twenty-two cadets being admitted in the first year. A great part of the fortifications at Quebec is reported to be falling into disrepair, and the absence of any guns of calibre sufficient to stop an ironclad is commented upon as a marked deficiency in the armament of a fortress which is supposed to command the entrance to the water-way of Canada. The warlike stores are indeed small in quantity; even of Snider ammunition there are not 140 rounds apiece for 50,000 men in the reserve magazines, although not a cartridge can be manufactured on that side of the Atlantic. In fact, the military resources of Canada are at a low ebb. The money voted for purposes of defence is small in amount, and in some respects commensurate value is not obtained from its expenditure. Throughout the Dominion, and especially in Ontario, a military spirit exists; the annual training is popular, the men are of a good stamp, and the officers avail themselves of the scanty means of instruction which their yearly drill affords; but it is useless to conceal the fact that the efficiency of the Militia is not built on solid foundations. The lessons taught in the barracks of the regular regiments formerly stationed throughout the country are still partially remembered, and a traditional standard of the efficiency to which the Militia should strive to reach is maintained; but, as years pass by, these recollections become more and more dim, and gradually, but not the less surely, will the military organization deteriorate.

For this result Canada is not so much to be blamed as the mother-country. For many years dependent on the presence of a large force of Imperial troops, Canada did little for her own protection. Roused by the great American Civil War, and by the troubles on her frontier of which it was partially the cause, a numerous Militia was formed on paper, and during the Fenian disturbances a considerable force was called out, drilled, and disciplined. Training-schools were established at the headquarters of the various regular regiments, and the services of able officers were secured to organize and command the several camps of instruction. The reports of the aptitude of the Canadian Militia for military work were very encouraging, and it appeared probable that in a short time a vigorous system of professional training would have been instituted. Suddenly the policy changed. The troops were withdrawn without any provision having been made for a continuance of the education they were affording; fortresses which had just been built at great cost were handed over unarmed to a Government which could not even afford to keep them from falling into disrepair, and stores which in many instances were old and obsolete were sold, at no mean price and after considerable haggling, to departments which, even if the articles had been serviceable, did not know how to use or preserve them. The military schools fell into decay and consequent disrepute; outside Halifax there was not a company, a squadron, or a battery which could furnish a pattern to the Militia, and Canada was left, unaided by the mother-country, to provide for her own means of defence. Considerable soreness was felt throughout the country at the manner in which the withdrawal of the troops had been effected; a period of apathy was the result, and the military organization threatened to collapse. However, the instincts of a nation proud of its connexion with England, and resolved to maintain its position, prevented so great a misfortune. Efforts were made to provide schools of gunnery, at which officers of all branches of the service might be trained, and these schools formed small but not inefficient garrisons for the two fortresses of Quebec and Kingston. The annual training of the Militia in camps of instruction was continued and the services of a few Imperial officers obtained. Recently the Government has decided on the formation of a military college at Kingston, with the object of training cadets as officers, and has asked to be supplied with three or four officers of the regular army to act as instructors. The request does not appear unreasonable; but hitherto the numerous difficulties which official routine has (perhaps unavoidably) thrown in the way of its fulfilment have delayed their appointment. In fact, England does not recognize the importance of fostering the military spirit of her colonies. Much might be done with little or no expenditure of money. One infantry regiment stationed in Canada, one squadron of cavalry, and one battery of artillery, involving no additional charge on the army estimates, would go far towards raising the standard of the Militia; whilst of the many staff officers who, having been trained at Sandhurst, are without employment, a few might be spared to assist in the instruction of the young men who are willing and ready to be educated on English models. If England were involved in a great European struggle, Canada would readily send assistance; and a well-organized force, such as she could with little difficulty equip, would be no mean addition to our army, and would repay the very slight cost which in peace-time our Treasury might be called on to pay. A really broad view of the organization of Imperial army should comprehend not merely the forces of England and of India, but those of the great colonies which, instead of being a weakness, ought to be a source of military strength to the mother-country. Times have changed since—only a few years past—it was the fashion among a certain type of politicians to look askance at our colonial possessions, and even indirectly to advocate the dismemberment of the Empire. Now a more truly national policy prevails, but it is only gradually that the apathy in respect to colonial institutions can be overcome, or interest awakened in even such vital questions as those which pertain, not to the defence of any especial colony, but to the organization of a military system which will embrace all portions of the Empire. Canada may in many respects be slow to grasp the importance of an efficient army administration, but not the less ought the impulse to be given by the mother-country, who should be ready to meet more than half-way any indications of energy and any desire for improvement.

CROWNER'S QUEST LAW.

THE zeal of coroners is always breaking out in some fresh place. At the last sittings of the Central Criminal Court Dr. Hardwicke had an opportunity of showing the sublime contempt of a medical coroner for forms of law. An inquisition had been found by a jury, charging no particular individual, but merely alleging that "the owners of the property" were guilty of manslaughter. It is stated that Dr. Hardwicke, after the inquisition had been thus found in blank, if we may so say, inserted the name of Mr. Beal, imagining, from some correspondence, that he was the person answerable for an alleged neglect. If this statement had not been made in Court, we should regard it as an audacious fiction. A medical coroner cannot be expected to understand or value the niceties of criminal law, but it would be easy for him, in default of common sense of his own, to obtain the help of a clerk who would keep him out of flagrant blunders. An inquisition, be it observed, is equivalent to an indictment, and must be framed with the same exactness. The jury are at liberty to find a verdict of murder or manslaughter against some person unknown, but when they have so found their verdict and recorded it, the coroner is not at liberty to strike out the words "some person unknown" and insert "John Smith." And yet this is in effect what Dr. Hardwicke did. It appears that an elderly lady was walking in the Liverpool Road on a day in February, and she fell on the pavement and received injuries of which she died. Dr. Hardwicke held an inquest on her, and the jury returned a verdict attributing her death to the unprotected state of the pavement in the Liverpool Road, and adding that "the owners thereof were guilty of manslaughter." This was the jury's work, and the Coroner finished it by putting in the name of Mr. Beal, who, as is now stated, was not even an owner of the defective pavement. The joke is heightened by the circumstance that Dr. Hardwicke professes a "long friendship" with Mr. Beal, and assures him that he acted only from a sense of duty in carrying out the verdict of the jury. It is an odd way of showing friendship to indict a man, although in a blundering way, for manslaughter, which is felony. An error in the coroner's office has been, says Dr. Hardwicke, the cause of all this trouble, but he wishes to pay Mr. Beal's legal expenses, and trusts that their friendly relations will be uninterrupted One of Mr. Trollope's recent heroes is tried for murder, and the Attorney-General of the day does his best to hang him; but when they meet after the trial in society they shake hands with apparent cordiality. Manners, as a French dramatist says, ameliorate themselves from day to day, and the form "My dear Mr. Beal" is now usually adopted towards persons to whom one has done or is doing all the harm one can. It is, in truth, the modern substitute for the kiss of Judas. No doubt, if Mr. Beal were reasonably thought guilty of manslaughter, it would be the Coroner's duty to have him prosecuted, notwithstanding their long friendship. But in that case we should expect the Coroner to be guided by law and common sense, whereas his actual proceedings exhibit a sort of confused analogy to those dealings with crossed cheques about which we have lately heard so much. A cheque may be crossed generally, and afterwards the name of a particular banker may be written in, just as the jury found a verdict against owners of property, and the Coroner inserted his dear Mr. Beal. It must be remembered that an inquisition is signed and sealed by the coroner and the jurors, and the notion of altering in a material particular an instrument thus solemnly completed is, to say the least, unbusinesslike. It must be allowed, however, that persons who ought to know better often make informal alterations in their wills, and Dr. Hardwicke's mistake was similar to this.

One of the uses of medical coroners is to make work for lawyers. In Mr. Wakley's time the practice prevailed in Middlesex of refusing to examine at an inquest persons whose conduct was thought likely to become afterwards the subject of criminal inquiry. Mr. Wakley did not invent this practice, but he seems to have adopted it as unobjectionable. There had been an inquest on a soldier who had died at Hounslow, and a medical journal had described the coroner's proceedings as a needless display of ingenuity to get up against the colonel of a regiment, or the surgeon, or a farrier, "a colourable semblance of murder." We believe that this was the case of the soldier who died after and the inquest was so managed that the persons whose been impugned were denied the opportunity of explai Court of Exchequer declared this practice to be expressed the hope that persons would be statements they might wish, when they had any to com-

nunciate. The Court said that the refusal to accept a person's testimony casts a gross imputation on him, and "such a practice is monstrous, and most harassing." It is fair to Mr. Wakley's memory to state that the comments made by a medical journal on his conduct in reference to this case were held to be in the main libellous, and he recovered considerable damages; but nevertheless it was clear that he had managed this inquest in an illegal and absurd manner. "It is not right," said one of the judges, "to assume that a man is guilty, and the witness may guard his own interest in giving his evidence." In the recent case the Coroner seems to have assumed that his dear Mr. Beal was guilty, on an *ex parte* statement, which turned out to be incorrect, that he was one of the "owners" to whom the jury imputed the old lady's death; and it did not occur to him that his proceeding was contrary, we will not say to law, but to the principles of justice which are supposed to be generally understood.

It must not, however, be supposed that medical coroners have a monopoly of absurdity and illegality. Mr. Carter, Coroner for Surrey, has lately delivered, if he has been reported correctly, an official opinion which could not be surpassed in extravagance by any of his brethren who write "M.D." after their names. According to the *Times* of this day week, Mr. Carter held an inquest on the body of a deceased man, and a mechanic named Lane stated that at one o'clock on Sunday morning he saw bubbles in the canal Peckham; he spoke to a constable, and the body of the deceased was recovered. In one of the pockets was found a paper stating that the deceased was tired of life. The usual verdict was found, and the Coroner severely lectured Lane for being out so late at night, and said that, if the letter had not been found on the body, he (Lane) would in all probability have been sent to take his trial for wilful murder. Some years ago it became material to explain in a Scotch case of murder why an important piece of evidence was not produced at the trial, and it appeared that a girl told her mistress that she had seen early in the morning something having apparent reference to this case, on which the mistress said, "Never let me hear you say a word about that again, or you'll be getting into trouble, I know." The mistress evidently supposed that justice was generally administered on the broad principle of Mr. Carter. A person who is out of doors late at night or early in the morning is presumably accessory to any crime that may be committed during the small hours; and, indeed, if it be doubtful whether a crime has been committed or not, that presumption is to be made which shall impute guilt to those who are detected in irregularity. This Coroner is like one of those old ladies who believe that a man who smokes a pipe is necessarily "dissipated." He had before him the question whether the man came to the water, or the water came to the man, and it might be thought that any evidence helping the jury to find it "Christian burial" would be welcome. The nursery rhyme says that, if the children had been at home, they would not have been drowned; and if the bubbles which Lane saw indicated recent death, the verdict ought to have been *felo-de-se*, on the principle of assigning the worst motive to the act of anybody who is abroad after midnight. The unfortunate witness was severely lectured, and refused compensation for his day occupied in attending Court; so that he lost his day because he had misspent his night. This, however, was only a small matter. The grave consideration is that this Coroner proposes to assume that any person found near, or having anything to do with, a dead body after midnight has committed murder. In one of the *Arabian Nights'* stories a corpse is carried from place to place in the streets of Bagdad by a succession of persons who feel that nocturnal proximity to it will bring them under suspicion involving at least the bastinado or some other form of torture. Neither in Middlesex nor in Surrey does crowner's quest law appear to have greatly improved since Mr. Wakley's time. He would have refused to hear any statement from the colonel who authorized the flogging of the soldier, or the doctor who superintended, or the farrier who administered it. He might or might not have allowed his jury to find a verdict of murder against those persons without hearing them. The practice in Surrey now is to hear the suspected person, but with a foregone conclusion as to his guilt.

It is a pity that the ancient and honourable office of coroner should be thus degraded. We are told that formerly the law gave such high credit to an inquisition of death found before a coroner that the judges would not receive a verdict acquitting a person of the death of a man found against him by the coroner's inquest, unless the jury finding such acquittal had also found what other person did the fact, or by what other means the party came to his death. If this were the law now, the administration of it would have to be put into more safe hands. Parliament supplementing the Common Law has carefully provided that men shall not in general be put on trial in criminal courts unless a bill of indictment has been preferred to and found by a grand jury, after some preliminary proceeding before magistrates. But a coroner's inquisition still receives so much credit that, if properly found, it supplies the place of an indictment. A few years ago some coroners had a notion that if, after an inquest duly held, and the body buried, the coroner received further information, he might dig up the body and hold another inquest. This notion was founded on a passage in the *Year Book* of 21 Ed. 4, which states that "Le coroner luy prist hors de son sepulture et priest novel indictment quel reherse tout le circumstance de le matter en fait del murdre." The indictment (as they called the inquisition at that day) stated that one of the servants of the said Wingfield, who was at the death of the man, "corna son corne," and said, "Here is an obit for his soul," and another servant said, "I would the stroke had lit on his master's neck," "et ceo fuit Jenney le Juge," which is explained to mean that Serjeant Jenney had become judge of the King's Bench early in that year. The disinterment of one of these old cases in its musty clothing of Norman-French and dog-Latin is almost as unsavoury a proceeding as that of Serjeant, afterwards Judge Jenney, who, "fecit dictum coronatorem iterum effodire extra terram interfectum xiv dies sepultum." The Court of Queen's Bench, after much discussion of this supposed precedent, concluded that it did not clearly appear from the report that the first inquest had been held *super visum corporis*, and therefore it was not a clear authority for what had been done in the case before them. It follows therefore that coroners cannot, in general, hold more than one inquest on one body, but they may, and often do, hold one inquest where they ought to hold none. It is not long since they assumed to hold inquests in cases of fire, and it would seem that any person who is out of doors late at night, at least in Surrey, might be committed for trial for arson if a fire happened to occur. The public will stand a good deal of oppression and interference of any kind that they are used to. But it is dangerous to make an antique institution ridiculous.

REVIEWS.

BAIN ON THE EMOTIONS AND THE WILL.*

THIS third edition of Professor Bain's *Emotions and Will* is so much enlarged, and so far rewritten, that it is in large measure a new book, and therefore may properly be made an exception to our usual practice, and be introduced to our readers by a substantive notice. In the case of a book so widely known, we need offer no apology for assuming a knowledge in the reader of Mr. Bain's treatment and general view of his subject, and shall deal only with the new matter introduced into this edition.

The first remark which is called for is one on the great pains which have been really taken to make this edition better than the two which have preceded it. There may be exaggeration in the common belief that it is easier to write a new book than to correct an old book; easier to write than to rewrite. But the belief is only an exaggeration of a certain truth. All authors who have attempted it know that rewriting is the most irksome of tasks. Indeed, so painful is it that few will impose it on themselves. The greater part of our English literature of to-day bears obvious marks of the crude haste of first draft. Our books are now thrown off, as the daily paper is thrown off, written from the inspiration of the moment, without correction or reconsideration. The newspaper can be produced in no other way. And, written as the newspaper article often is—often after midnight—with the compositor waiting for copy, it is surprising how good even in style and composition such articles are. But with the book there is no such pressure, except, indeed, the general hurry in which all our life in this busy country is lived. It is the painful effort of rewriting which deters authors from elaborating what they give to the public. The freshness of subject at the first draft is in itself an excitement which lifts us over the drudgery of the pen. When this drudgery has to be undergone without the stimulus of novelty, the birth-pains of composition become too intense to be faced. The operation of recasting thoughts is not merely laborious, it has attached to it a mental pain of a peculiar kind. It implies a control of the will over the intellectual processes, of a more severe kind than the spontaneous attention which easily follows the natural flow of the habitual thoughts. Reproduction, reconstruction, revision, improvement, are far more difficult operations than production and extempore gush.

If our books in their first editions have seldom the benefit of their authors' second thoughts, it might be supposed that, when a second edition is called for, an author would be willing to bestow some pains in improving his work, which the public has shown to have some value to them by buying it. This is far from being always, or often, the case. The sale of an edition, instead of stimulating our authors to work towards completeness, is often taken as a reason for being satisfied with a book as it is. The publisher, too, has an interest in hurrying on the new edition before the demand shall subside. Slovenliness of correction is often carried to the point of leaving a confessed error in the text, and placing its correction at the foot of the page in a bracketed note with the later date of the edition in which it was first added. The "limæ labor," incessant correction, is the condition of the classic style. But this is not true only of style. The contents of a book require recasting quite as much as the language. The subject is first conceived in the author's mind in embryo. The writing the book is a process of growth and development. It is like the construction of a picture. There is first the rude charcoal sketch, a bare marking out of the boundary. Then this boundary is outlined so as to enclose the great masses. Next comes the laying of the dead colour within this outline, and so to the painting of each square inch in detail, film over film, till the painter has so covered his canvas that he can add nothing. But the writer has this vast advantage over the artist, that his book can

* *The Emotions and the Will.* By ... LL.D., Professor of Logic in the University of Aberdeen. Third ... Longmans & Co. 1875.

always be repainted. A painter has no second editions. In books, a new edition is the author's opportunity. If this opportunity is rarely used by our authors, it is partly owing to defective mental discipline, partly to the material conditions of publication. Many of our books—even the books of our best men—are first thoughts. They are the young impressions of vigorous intellect in its early wrestle with some untried class of facts. Such books have the great charm of freshness; they have an originality, not of subject, but of mental spring. The very merit of such books is a merit which is incompatible with revision. When the author sits down to correct his book for a new edition, the chances are that he prunes away the luxuriant growth in which its charm lay. The spirit is gone, and he cannot replace it, as he wrote from animal spirits, and not from knowledge. Not less unfavourable to elaboration are the conditions of publication such as they are now. Book-producing is a trade, and is subject therefore to the same necessities as all trade. It is more advantageous to turn out many of a common article than a few of a superior class. A writer has his choice between perfecting one book and extemporizing a great many. It is the choice between reputation and money. Few authors are in such a happy position as to be able to choose the former. If Professor Bain had thought only of being paid for his time, he would doubtless have laid it out to far more advantage in writing a new book than in re-writing, as he has done, the present. Had he simply reprinted the second edition of *The Emotions and the Will* as it stood in 1865, he would probably not have sold a single copy fewer than he will now sell of this greatly improved edition.

The changes introduced into the present edition, we need hardly say, do not amount to alteration in the point of view from which the subject is regarded. A reviewer of the first edition, Mr. Herbert Spencer, writing anonymously in the *Medico-Chirurgical Review*, brought against Mr. Bain's work the charge of being a collection of miscellaneous observations on mind, rather than a scientific analysis. It bore the stamp of the inchoate state of psychology. Its classification was the crude and rough first generalization which in the infancy of knowledge suffices to bring the phenomena into some sort of order, so that science may go to work on them. It was, he urged, a natural history of the emotions based on external characters. This criticism is less a criticism of Mr. Bain's book than a denial of the existence of psychology as a separate science, or as a science at all. If urged as a defect against Mr. Bain's book, the obvious answer is that at present there is no other mode of treating the psychical phenomena possible. The old psychologers, relying as they did on one source of observation only—namely, consciousness—had a uniform basis. The division into intellect, sense, emotion, and will was not only an obvious arrangement, but one which satisfied the state of the science. But it is impossible now to confine our survey of mind to the facts testified by our individual consciousness. Other, various and distinct, branches of evidence have come forward, which not only supplement consciousness, but have thrown it into the background as a quite subordinate, and even suspicious, method of investigating the facts. Physiology has risen into first importance as a method. Comparative physiology, natural history, development, social phenomena, little used hitherto, all have been called in to aid. This has destroyed the simplicity and unity of the science. We cannot tell whether the phenomena we are investigating are psychical or physiological. Biology tends more and more to bring the facts within the range of its own principles, but it has not yet done so wholly. It would be premature to abolish mental science, because we have not yet been able to analyse the complex states of feeling or thought of which we are conscious into the simple elements—the germ, the embryo. Nor do we know whether it will ever be possible to do this. It follows that, if we are to treat the manifestations of mind at all, we cannot neglect any one of these sources of information. If the want of unity of principle, the shifting basis of investigation, deprives psychology of all right to the title of a science, it only shares this defect with politics, with economics, with sociology, with therapeutics, and with every branch of inquiry into which the complex organism of man enters. If not a science, psychology is a colligation of observed facts at once true, important, and analogous. Call it, if you will, the natural history of man.

Professor Bain has not in the present volume met this objection, which had been brought against his treatment, with any direct answer. Perhaps he thought a criticism based on *à priori* speculations too remote from his subject. Yet he has not been wholly uninfluenced by it in revising for the present edition. He has introduced a whole chapter in which he directly discusses the bearing of the evolution hypothesis, and the theory of inheritance, on the emotions. He has endeavoured to find a ground for precision of scientific handling by introducing a sort of measure of quantity of feeling. In the treatment of the æsthetic emotions Professor Bain has pursued his analysis of these complex effects into their rudimentary sensations still further than he had done before. And generally, throughout the volume, the tendency of the changes introduced strikes us as being in the direction of carrying back the complex towards the simple embryo, rather than in that of the accumulation of new concrete facts. This is more especially the case in the first part, which treats of the Emotions, than in the latter half of the volume, of which the Will is the subject. Perhaps this is only because in the earlier editions Professor Bain had already pushed the analysis of volition into its component elements—spontaneous movement and the law of self-[illegible] as far as it is possible to carry it.

Among the topics which make their appearance for discussion for the first time in this edition, one is the possibility of estimating quantity of emotion. "Accurate measurement," in the words of Sir W. Thomson, "seems a less lofty and dignified work than looking for something new. But nearly all the grand discoveries of science have been but the reward of accurate measurement and patient labour in the minute sifting of numerical results." As there is no possibility of computing amount of emotion, the subject is not only removed from the category of exact science, but is in a high degree vague and unsatisfactory. All statements respecting degrees of happiness and misery are untrustworthy. We cannot pass beyond indefinite adjectives, as where Sir Arthur Helps speaks of "the *extraordinary* pleasure of grappling with a scientific problem." This defect in the subject is indeed common to all the "moral sciences," as they are called, and has been matter of complaint from the time of Aristotle. But it is to the employment of consciousness as the instrument of investigation that the objection is especially fatal. As by consciousness we only know our own emotions, a standard of their intensity, which implies comparison, is impossible. We are obliged to relinquish consciousness for the observation of the signs of feeling—gesticulation, energy of pursuit, persistence, repetition. Language is the least trustworthy interpreter of feeling, as we have to find some means of seeing through reticence, reserve, disguise, dissimulation, and hypocrisy. After we have registered the signs, we are still in want of a standard. Nothing more exact is to be had, according to Mr. Bain's admission, than an average roughly derived from the common observation of human action. Aristotle was content with three stages, or degrees—a mean, an excess, and a deficiency; the average attainment of human nature being taken as the standard of the "how much." Professor Bain suggests that the scale might be extended, and thus two or three grades above an assumed mean be obtained. The same scale of measurement might be applied to emotion, by supposing it to begin at zero—the lowest degree, that is, of any assignable value. We might pause at the greatest height of intensity that is ordinarily reached, and reserve an additional epithet for some pitch of very rare occurrence.

The chapter on Evolution as applied to mind is wholly new. The introduction of the topic was rendered inevitable by the prominence which this aspect of psychological questions has been acquiring since the publication of Mr. Bain's second edition. Here, while bringing the facts forward without reserve, the general tendency of the exposition is to impress us with the belief that the hypothesis of heredity has been strained too far. In particular, Professor Bain will not explain by its means the moral sentiments. And it is upon its application to the explanation of the conscience that the interest of the inheritance theory chiefly turns. Looking at the precocity of the early impressions connected with the outer world, Mr. Bain allows that the experience of the individual can hardly account for them; but he declares without hesitation against the intuitive character of the moral sentiment. Certain primitive powers belonging to the being at its birth are indispensable to the growth of our moral feelings. Such are sympathy, the ordinary action of will, and the fundamental emotions, love and anger. These inborn, or evolved, powers of the mind being supposed in the individual, the formation of conscience is to be ascribed to education under authority, which constitutes in the moral sentiment a distinct and peculiar phenomenon, different from all the other exercises of will, sympathy, love, or any compound of these.

The chapter on Belief, in the former edition, always appeared to us something less than quite satisfactory. Was it from some consciousness of this on the part of the author himself that he has undertaken to rewrite the discussion for the present edition? We cannot say that the subject has even yet assumed in Mr. Bain's hands its final shape. Not that this prevents the chapter from offering, as it does in abundance, striking views and suggestive remarks. But, in the first place, belief is treated by Professor Bain as if it were one defined, clearly-marked psychological state, as much as memory or attention. Instead of this, the term is one which, being perpetually in our mouths, is applied to a great variety of conscious states, themselves of an indefinite nature, passing through the whole scale from mere assimilation of a momentary impression to the radical conviction on which our intellectual fabric rests. In the second place, the test of belief which is here proposed—readiness to act upon it—though all-sufficing for the commerce of life, has no metaphysical validity. So far as one single mental state can be singled out from a multitude of cognate phenomena for description under the name of "belief," it is a purely intellectual condition. As such, its place is in Logic, and not in a volume on the Emotions and the Will. True, the reflex action of feeling, pursuit, and desire on belief has to be put forward. But these are influences, not elements. More than this, they are illegitimate influences; for in the properly constituted intellect the amount of belief accorded to a statement is assumed to be exactly proportioned to the evidence. Mr. Bain's treatment of belief in this chapter is really an enumeration of those irregular influences—the idols—which are allowed by human weakness to cloud or override the intellect in its struggles to arrive at truth. It is not an account of belief, but of the sources of perverted beliefs. Mr. Bain himself says:—

> It is curious to observe the balancing of the two opposite tendencies, primitive credulity and acquired scepticism. Nothing but [illegible] attain the exact adjustment; we have either too much of the primitive credulity, or are too deeply stung by the retrospect of the past to maintain the credulity in its exactest [illegible]

of nature; too little laying to heart the jars of interrupted expectations. The great master fallacy of the human mind is believing too much, believing without or against evidence. The signal example is over-generalization, the vice of every human being for the early part of life, and of more than nineteen-twentieths to the last.—P. 513.

These observations are undeniably just, but they are what we should have expected to find under the head of "Fallacies" in logic, rather than in the division "Will." The same remark applies to the interesting topic touched upon in p. 533 and following, as to the nature of our belief in memory, and the distinction we make between sensation and idea.

STUBBS'S CONSTITUTIONAL HISTORY.—VOL. II.*

THERE is a certain difficulty in reviewing such a book as that of Professor Stubbs, because the words which naturally express its character are not unlikely to seem exaggerated to those who have not used the book itself. We say "used" the book; because no one can really tell what such a book is, no one can fully know what really are the obligations of historical learning to Mr. Stubbs, till he has done something much more than read the book. It is only by what may be called experimental use, by that kind of use which comes of special study for the purpose of getting up this or that special subject, that we grasp, in all their depth, the two great characteristics of Mr. Stubbs's History, its absolute exhaustiveness and its unfailing accuracy. Mr. Stubbs's History is, as it professes to be, a Constitutional History; it therefore does not take in, or profess to take in, every side of our national history. It is indeed wonderful to see how wide a range constitutional history can be made to take when all its bearings are duly looked at. Mr. Stubbs rightly shows that a great deal comes under the head of constitutional history which it did not occur to earlier writers to bring under that head. Still a Constitutional History is a history from a special point of view; the things to be mentioned and to be passed by are not always the same as they would be in a narrative history of the same bulk; still more commonly do the points which are dwelled on take a different proportion to one another from what they would take in a narrative history. Mr. Stubbs of course assumes a fair knowledge of English history in the ordinary sense in any one who begins to read him. In a mere reading of such a book one of course learns much; but it is only in a process beyond mere reading that we find out the full strength of our teacher. Let a man undertake himself to write on any of the subjects or periods which are dealt with in Mr. Stubbs's work; it is then that he will learn in its fulness what Mr. Stubbs's work really is. He will then thoroughly take in how Mr. Stubbs's book differs, not merely in degree but in kind, from any other book of the same class. The process is in one way a little disappointing. We speak the experience of more than one when we say that, in going over ground which Mr. Stubbs has gone over, it is impossible, or next door to it, to find anything to say that is positively new. It is almost as impossible to find any point on which Mr. Stubbs's conclusions can be disputed with any show of reason. The writer whose course takes him on any part of Mr. Stubbs's ground may indeed expand and illustrate this or that particular point; but he will have nothing to do but to expand and illustrate. He will find the main work done to his hand, in a way in which he will certainly not find it done to his hand in any other book dealing with so large a period of English history.

In saying this, we are of course speaking of what has been the experience of other scholars with regard to the first volume; there has as yet hardly been time for any one to put the second volume to the same minute and searching test. But it is plain, even from an ordinary reading, that the second volume is of exactly the same character as the former one. We see in the second, as in the first, all the signs of the scholar who can be fully trusted on all points. Here, as in the other, is the research which nothing escapes, the accuracy which never fails, the judgment which never swerves. Here, as in the other, we see the same calm and comprehensive view, taking in every side of a subject, the view of the true historian as distinguished from the petty and partial treatment of lawyers, heralds, partisans of this or that political theory. That Mr. Stubbs is precise and positive on every point we will not say; but it is only those who know nothing of the nature of his work and its difficulties who could expect him to be precise and positive on every point. Through a great part of the present volume he has to deal with matters which are really more difficult than anything either in earlier or in later times. He has to deal with the settlement of our Parliamentary system, with the gradual process by which the constitution of the several elements of the State, and their exact powers and functions, were settled. Any one who knows how all this was done by a series of efforts and experiments, who knows the strange irregularities of the time, the way in which the precedents of one Parliament were by no means always followed in the next, will see that the difficulty lies in the very abundance of the materials. It is easier to deal with earlier times, when materials are scantier, and when, unless we are to hold our peace altogether, theory must be allowed a certain range. It is easier again to deal with later times, when constitutional principles had become fixed. In describing a Witenagemót of the Confessor or of the Conqueror, all that we can do is to put together such slight and occasional indications as we can get. In describing a Parliament from the sixteenth century onwards, we are dealing with a body of which the constitution and the main principles of procedure are fixed beyond dispute. In the intermediate state, in dealing with a Parliament of Edward the Third, everything is uncertain. The materials are endless; but what they largely go to prove is how unsettled everything was. This chaotic state of things, when things were moving in the direction of progress, but with slow and fitful steps, is the subject of the second part of Mr. Stubbs's first volume. The former part of the book deals with a more attractive time, that of the growth of Parliament itself in the days of Henry the Third and Edward the First. The political and moral difference between the two is strongly pointed out by Mr. Stubbs in more than one passage, especially in the pages of singular force and eloquence which wind up the volume. To him the thirteenth century is an heroic age, an age when great men strove for great principles, and when we may not only find matter for satisfaction in the general result of the course of events, but may find distinct pleasure and distinct matter for approval in the events and actors themselves. To the ordinary reader the fourteenth century may perhaps seem more attractive than the thirteenth. It has what is to many minds the charm of a great foreign war, a war which has been tricked out with all the attractions of chivalry and romance. The mass of Englishmen have been carefully taught to see national heroes in Edward the Third and his son, while they are still more carefully taught to look on Edward the First as an unjust aggressor. In Mr. Stubbs's view the wars of both Kings are passed by with but slight notice; to him they are important only in their bearing on constitutional matters. And to the importance of the fourteenth century, both in its constitutional aspect and in many other ways, Mr. Stubbs is fully alive:—

> Viewed as a period of constitutional growth it has much to attract the sympathies and to interest the student who is content laboriously to trace out the links of causes and results. In literary history likewise it has a very distinct and significant place; and it is scarcely second to any age in its importance as a time of germination in religious history. In these aspects it might seem to furnish sufficient and more than sufficient matters of attractive disquisition. Yet it is on the whole unattractive, and in England especially so: the political heroes are, as we have seen, men who for some cause or other seem neither to demand nor to deserve admiration; the literature with few exceptions owes its interest either to purely philological causes or to its connexion with a state of society and thought which repels more than it attracts; the religious history read impartially is chilling and unedifying; its literature on both sides is a compound of elaborate dialectics and indiscriminate invective, alike devoid of high spiritual aspirations and of definite human sympathies. The national character, although it must be allowed to have grown in strength, has not grown into a knowledge how to use its strength.

He then goes on to complain of the decline both of public and private morality, the growth of luxury and of political vindictiveness. On this last head things undoubtedly got worse and worse from the eleventh century to the sixteenth, possibly even later. On the former head Mr. Stubbs aptly says that "Edward III. celebrating his great feast on the institution of the Order of the Garter in the midst of the Black Death, seems a typical illustration of this side of the life of the century." In the last page of all, and perhaps the most remarkable of all, Mr. Stubbs goes on to say:—

> It may seem strange that the training of the thirteenth century, the examples of the patriot barons, the policy of the constitutional king, organiser, and legislator, should have had so lame results; that whilst constitutionally the age is one of progress, morally it should be one of decline, and intellectually one of blossom rather than fruit. But the historian has not yet arisen who can account on the principles of growth, or of reaction, or of alternation, for the tides in the affairs of men. How it was we can read in the pages of the annalists, the poets, the theologians: how it became so we can but guess; why it was suffered we can only understand when we see it overruled for good.

And he winds up with a hint of what is to come in future volumes:—

> Weak as is the fourteenth century, the fifteenth is weaker still; more futile, more bloody, more immoral; yet out of it emerges, in spite of all, the truer and brighter day, the season of more general conscious life, higher longings, more forbearing, more sympathetic, purer, riper liberty.

These passages are remarkable, as showing the many-sided powers of the writer's mind, the depth and earnestness of his view of history, equalled only by the wideness and power of his grasp of it. They show also that deep sympathy with right in every form, political and moral, which breathes throughout all Mr. Stubbs's writings. He has throughout the strength, the clearness, the calmness, of the man who looks on his subject as a whole, in whom the minutest study and knowledge of detail has in no way weakened the power of looking all round his vast theme from every possible side. Throughout this volume, as throughout the former one, he writes everywhere as a lover of freedom, as an admirer of the men who strove for freedom; but he is never a mere political partisan. At each stage we wait with a kind of anxiety to see what will be his judgment on the next stage; we do not, as we do in the case of a merely partisan writer, feel sure beforehand what it must be. We feel that we are listening to one with whom truth is before everything—truth in all its varieties, from the loftiest form of moral truth to the minutest truth of a name or a date. In short, this volume, like the one which went before it, shows in its author the highest form of all the highest qualities of the historian in every branch save one. And in that one, if it does not prove their existence, it at least suggests it. Among all Mr. Stubbs's great contributions to historical learning, he has never yet attempted a direct narrative history. Both in this and in the former volume he is often on the verge of it, but only on the verge. He has often to narrate events,

* *The Constitutional History of England in its Origin and Development.* By William Stubbs, [illegible] at the Clarendon Press. 1875.

but only such events as bear on his constitutional subject. His scheme never calls on him to give a complete consecutive narrative of the events of any one period. Yet when we see in these volumes the grasp which Mr. Stubbs has of men and things and events, and when we think of his living portraits of the Angevin Kings and so many of their contemporaries, his summaries of their reigns in all respects, not merely constitutional, but personal and œcumenical, we feel sure that the constitutional historian of England could also be, if he chose, its narrative historian.

The history of both the centuries dealt with in this volume still lacks its narrator. For Mr. Stubbs to tell the tale of the thirteenth century would be in itself a labour of love; to tell the tale of the fourteenth would be at least a relief after the weariness of working through its constitutional details. A narrative of these two centuries, taking the results of Mr. Stubbs's constitutional labours for granted, would indeed be a work worthy of his powers. And yet, after all, this may not be the special task to which he is most clearly called. We must remember that his constitutional view is not bounded by the four seas of Britain. Both in the Select Charters and in many parts of the present work, he shows that with him the constitutional history of England is only one part of the constitutional history of Europe. We could almost hope that, when he has done with the Constitution of our land, he may go further and point out, in his wide œcumenical spirit, the relations between the political history of England and the political history of so many other lands which started from nearly the same point, but whose course led them to such widely different goals. But for the present we have to deal with what is actually before us, the constitutional history of England from the winning of the Great Charter to the deposition of Richard the Second. We have pointed out some of the chief characteristics of Mr. Stubbs's treatment of the period. In another article we must go more regularly through the book, and say what we have to say as to his dealing with particular points in the story and with particular branches of constitutional development.

THE GREAT DIVIDE.*

BOOKS of travel and adventure in the half-settled States of the Union are the milestones that mark the marvellous progress of the country. Fenimore Cooper laid the scenes of his romances in forests that have now been cleared for generations, and dotted over with the boxes of prosperous citizens. When Washington Irving wrote his *Astoria* and *Tour on the Prairies* the trappers and hunters started from frontier posts which have since sprung up into flourishing cities; and no white man at that time felt easy in his scalp anywhere far to the west of the Missouri. Since then the Mormons in their armed exodus have forced their way to the heart of the continent, and miners and backwoodsmen, setting their faces to the West, marking their broad trails with the bones of men and animals, have been crowding up the locations of their choice in the midst of the favourite hunting-grounds of the savages. From vast districts that have been formed into Territories and States the Indians have been driven back with the buffaloes, or else they have "gone under." And now a little party like Lord Dunraven's can travel comfortably by first-class railway carriage to within 250 miles of the desolate solitudes in the basin of the Yellowstone, and carry out their plans of exploration at leisure, without taking any but the most ordinary precautions against disturbance from hostile Indians. Indians there are, it is true, and they are said to be sometimes troublesome. But, as a matter of fact, they seem very much bound over to keep the peace in those parts by the painful sense of their dwindling numbers. They have either been gathered into reservations by elastic treaties with the Government, or settled in villages under the surveillance of the Indian agents.

The "Great Divide" is the central watershed of Northern America, forming part of the territories of Montana and Wyoming, and three great systems of water have their sources in it. The Yellowstone and the main streams of the Missouri flow towards the east, to unite in their lower courses; the Snake River runs towards the west before turning to the north to become the Columbia; while the Green River, which runs southward, is the main feeder of the Rio Colorado. There are a variety of inducements to tempt the adventurous traveller to visit that Yellowstone country, and the name of "Wonderland" which has been given it by the miners and hunters who were the first to make their way thither is more than enough to excite curiosity. The upper and lower basins of the valley of the Yellowstone contain some of the most remarkable and stupendous volcanic phenomena that are known to exist on the earth's surface. It is true that the scenery to be traversed is sometimes dismal. The track lies through dreary deserts, with an unkindly soil impregnated with alkaline deposits. But the traveller appreciates all the more the pleasures of contrast when he finds himself descending on the banks of some romantic stream, where verdant meadows are enclosed in scented pine woods; and occasionally he comes upon those "natural parks" which have been fashioned by nature on a magnificent scale in the very heart of an inhospitable wilderness. The mountains that cluster in rocky knots about the numerous fountain-heads of the great rivers are often exceedingly grand, though they rise from a lofty level; while some of the peaks, like that of Mount Washburne, which was ascended by Lord Dunraven, command most varied and extensive views. Finally, there are the Great Falls of the Yellowstone, which, although inferior in height and grandeur to those of Niagara, would themselves repay a long journey. Not that this journey, as we have remarked already, can be said to be either very long or formidable considering the character of the country it leads to. From Corinne, one of the stations on the railway, you may travel by stage to Virginia City, a weary distance of 330 miles, but involving nothing more than discomforts. And, arrived at Virginia City, at which or at one of the trading posts in the vicinity you may make your final arrangements for the expedition through the wilderness, you are only 100 miles from the Lower Geyser Basin on the Yellowstone. In Virginia City, by the way, one has a characteristic illustration of the swift vicissitudes of fortune to which "locations" in these half-inhabited territories are liable. It sprang up so lately as 1863, when "some of the richest placer workings of the continent" were discovered in the numerous gulches and gullies which intersect the bleak bluffs that surround it. But the riches of these placers were worked out; explorations pushed up-stream failed to discover the great deposits of the gold-dust; and the once wealthy place is chiefly abandoned to gangs of industrious Chinamen, who live by washing in the leavings of their predecessors.

Should he have an idea of following on the trail of an expedition of this kind, an Englishman's first inquiries would be naturally after the sport. As to that, Lord Dunraven says very candidly that it is always precarious and seldom of first-rate quality. There are still buffalo to be found on the plains in tolerable abundance, but the herds are so much in the habit of shifting their ground that it is hard to tell how one may best arrange so as to fall in with them. A raw hand is pretty sure to find himself abroad, unless he has the prudence to resign himself blindfold to the tutelage of some resident who has passed master in venerie. There are deer of various species, and notably the noble wapiti, which are still far from extinct, though the work of extermination goes steadily forward. The graceful prong-horned antelopes are numerous in the plains and in the valleys about the foot of the mountains; while wild goats and the moufflons or mountain sheep are still plentiful among the precipices of the less accessible ranges. But, so far as Lord Dunraven and his companions were concerned, the results of the chase were decidedly disappointing, although he had selected his staff of attendants with great judgment. As henchman and standing counsellor, he had brought with him one Campbell, a Scotch deer-stalker; while for their local experience he had retained the services of a famous American hunter named Texas Jack, and a certain Fred Boteler, who had his ranch on the outskirts of the settled country. Yet the party only succeeded in bagging three wapiti, a bighorn or two, and some of the smaller species of deer; and indeed the scarcity of venison they brought into camp compelled them to change their original plans and return by the way they had gone. Owing partly to a run of ill-luck, partly to their over-sanguine temperaments, the expedition had to go through a good deal of hardship. Having reckoned on being able to provide themselves by means of their rifles, they had loaded their pack-mules with somewhat scanty supplies, with the result that latterly it was all they could do to keep body and soul comfortably together. Chasing the bighorn among the mountain peaks may be exciting enough to be enjoyable when supper and breakfast do not depend on success. But when a man has been roughing it on short commons for a succession of days, until his appetite is wolfish and his strength and spirits begin to succumb, then he is apt to throw his soul into the stalk with a ravenous ardour which tends to defeat its own purpose. We doubt not that it was a real sorrow at the time, though he relates it in the retrospect lightly and humorously, when, after much severe exercise and several blank days, Lord Dunraven saw a bighorn he had tumbled over and counted for dead totter on to its legs and carry its carcase away from his hunting-knife. The weather too was far from being all that could be desired, and the party suffered the more from the wet and exposure that their stock of stimulants was exhausted. Thus we have a description which sounds more picturesque than pleasant of one particular night when a straggling member of the party came nearly to an untimely end. The night was black as pitch; the rain descending in torrents; everything in camp was soaked, from the tent to the bedding and the clothes of the victims. His lordship, with Jack and Boteler as his aides-de-camp, stretched a wapiti skin from the branches by way of protection, and contrived to get up a kindly blaze. There sat the half-starving men, waiting anxiously for the arrival of the Doctor—Kingsley—who, as they fondly hoped, might bring them some venison. At length they heard a shot, followed by another and another, when they made up their minds that he was lost and was signalling for help. The men started off to bring him in, and Lord Dunraven and his dog were left watching the fire, and listening to the dismal plash of the rain and the melancholy howling of the wind through the pine boughs. We can believe him when he says that his watch was "very gruesome," and we admire and appreciate his candour when he confesses that he began to be "horribly afraid." By way of aggravation, too, his tobacco was wet, nor could he touch the last drops of their whisky, which he was keeping as a restorative for the missing man. And when poor Kingsley was at last brought in, pretty thoroughly exhausted, he had to content himself with the simple application of heat, there being neither food nor spirits to revive him, for some unlucky accident had upset the pannikin.

* *The Great Divide: Travels in the Upper Yellowstone in the Summer of 1874.* By the Earl of Dunraven. London: Chatto & Windus. 1876.

The moral of the story is that excursions of this kind should only be undertaken by men of proved strength of constitution. But to those who are blessed with robust health, the wonders to be seen in the Yellowstone region might compensate for a good deal of danger and hardship. The Upper Falls are formed by the sudden closing in of precipitous walls, where the compressed body of water, "rushing with such force through a narrow space, shoots clean out into the air and dashes down 140 feet." The effects below are somewhat remarkable, where the falling water, striking a slightly submerged ledge of rock, is thrown forward in a fan-like form over the dark surface of the deep pool below. "Above the Lower Fall also the waters are compressed and heaped up into a narrow channel, and the Yellowstone entering the gorge with the velocity acquired in its rapid descent from the upper shoot, and passing tumultuously through, hurls itself out bodily from the edge with a descent of 397 feet, forming a very grand cascade." But the sight that awaits the visitor to the Lower Geyser basin, if it cannot be described as beautiful, is decidedly more striking. The surface of the earth is honeycombed by violent volcanic forces, expelling mud and water in streams and spouts that assume every variety of form and volume. In some places there are an infinity of little jets shooting up through minute cracks and fissures, in others vast volumes of the boiling water fall back into steaming pools. Yet the element of beauty is not altogether wanting in detail, although the general effect is ghastly to repulsiveness. For these manifold springs, with their rims and their orifices, are variegated in endless shades of colouring, produced by the deposit in combination of iron, silica, and sulphur. From the point at which the party entered the Lower Geyser Basin to the spot where they encamped lower down the valley, their road lay along the banks of the Fire Hole River, appropriately named from its draining off the boiling fluid, which it carries down into the Madison. The water in its innumerable little tributaries was, for the most part, variegated as we have described; their banks were richly inlaid with patterns in mineral mosaic; while here and there, and scattered all over the valley, rose geysers of every size and shape, the pools and lakelets into which they played being elevated on mounds of their own formation. Some of these have evidently nearly exhausted their powers, after a long course of violent activity. Others are still vigorous, though irregular and spasmodic in their outbursts. But there are one or two which can always be relied upon to show themselves off to the best advantage; and the visitor need never be condemned, as in Iceland, to curb his curious impatience and dance attendance on their caprices. We may say that the cream of Lord Dunraven's narrative is to be found in the excellent chapters that deal with the phenomena in the Geyser Basin. But the book contains a variety of interesting information about the country, and the men and animals that are to be met with in it; and, when he is fairly warmed into admiration, he shows very considerable powers of impressive and vigorous description.

A GERMAN VIEW OF JUNIUS.*

IF the sole, or even the main, object of the essay before us had been to make one more attempt at solving the question of the authorship of the *Letters of Junius*, Professor Friedrich Brockhaus might have had to be congratulated on the boldness of his venture, but could under the circumstances have hardly hoped for conspicuous success. The tests which it is necessary to apply to the question are so many and so various, and the special literature which has accumulated around it is so voluminous, that it scarcely admits of being studied with completeness out of England. To take the test of handwriting alone, its application cannot nowadays be fairly discussed without a close examination of the Chabot-Twisleton quarto, and the mere size and general nature of that publication have necessarily prevented its wide circulation. And even on this question of handwriting, as will be remembered by "constant readers" of the *Times*, which on May 22nd, 1871, made Mr. Twisleton's book the occasion of a remarkably witty criticism, the scholarly dilettante and the indefatigable expert cannot fairly be said to have pronounced the last word. While, again, the entire question, whether solved or not, must always remain one of cumulative evidence, it is impossible for any one not resident in England to take note of the little additions which continue from time to time to crop up on one side or the other—as, for instance, the other day in the first volume of Lord E. Fitzmaurice's *Life of Lord Shelburne*. And of course it can only be very exceptionally, if at all, that the *personalia* of our political history in the latter half of the eighteenth century should be fully mastered by any but an Englishman. Accordingly, the question *Who was Junius?* has not to our knowledge ever been subjected to a really authoritative treatment abroad. M. Charles de Rémusat indeed, if we remember rightly, many years ago, in the *Revue des Deux Mondes*, lent the support of his remarkable familiarity with our historical and political literature to the odd theory ascribing to the Letters a divided authorship; and, to refer to a less responsible source of literary intelligence, the same or a not dissimilar view has inspired an ingenious production of one of the most skilful and popular of living German dramatists—Heinrich Laube. Professor [illegible] has, however, abstained from any attempt, conscious or unconscious, at such paradoxes; he declares himself a Franciscan pure and simple, recites the general evidence in favour of this now so widely accepted view with clearness and force, does not vex himself or his readers by dwelling at any length on the doubts which have more recently been suggested against it, considers (on the authority of the *Quarterly Review*) that Mr. Chabot has permanently settled the point as to the handwriting, and is not troubled by the discrepancies which some critics have recognized between the opinions and the general mental calibre of Francis on the one hand, and the author of the Letters, whoever he was, on the other.

The value and interest of this essay for English readers are therefore not to be sought in that part of it which addresses itself to the question of the identity of Junius and Francis. Rumour has for some time asserted that it is the intention of an eminent legal authority in this country to charge the public on the whole of the evidence on the subject; and that will be the occasion for what Professor Brockhaus calls *die Gelehrten der Junius-Frage* once more to open the sluices of their knowledge and to pour forth the whole wealth of their conclusions, convictions, and conjectures. Till that time arrives, we are content to keep our own opinion a little in arrear of Lord Macaulay's famous declaration, that the evidence in favour of Francis is such as would be sufficient to convict a murderer—even though we have had the advantage of perusing the late Mr. Twisleton's quarto, and of deriving such aid as they supply from the lucubrations of the late Mr. Parkes. In a word, the balance of testimony seems to us strongly in favour of the Franciscans; but we would neither hang a man on such evidence nor—since the question is not one within the domain of the New Shakspeare Society—be ourselves prepared to die the death in support of our belief.

What, on the other hand, makes Professor Brockhaus's essay worthy of attention beyond the circle of hearers and readers to which it was primarily addressed is the admirable lucidity and force with which, in four successive sections, he has brought out the historical significance of the Letters, and the political as well as the ethical principles which they illustrate. These parts of the essay show the firm hand of the trained student of comparative politics, as well as the sound and sure judgment of a mind fortified by its command of the science of law. Professor Friedrich Brockhaus is the son of one of the most distinguished members of the now foremost German University, that of Leipzig; but, while his father ranks among the first of living Orientalists, and his brother, Professor Clemens Brockhaus, is already making for himself a name as an ecclesiastical historian and ecclesiologist, the youngest member of the academical branch of this well-known family has chosen for himself a different line of intellectual labour. We briefly noticed, a few years ago, his lucid, and in some respects novel, treatise on the Principle of Legitimacy in Politics, which discussed theories and conceptions of considerable legal interest as well as of obvious practical significance. His present essay is, if only from the circumstances of its origin as a popular lecture, less elaborate both in matter and in form; but it has the same firmness of texture and thoroughness of manner, and though its purpose is modest, it fulfils that purpose with scholarly completeness.

The exceptions we have here and there to take to Professor Brockhaus's views or conclusions may best be stated incidentally in a brief summary of the course of his argument. He shows what was the nature of the changes which already in the former half of the eighteenth century had taken place in the working of the English Constitution; how not only had the Crown (the symbol of the continuity of our political history) become the "monarchical firm of a republican business," but how that Parliament whose majority held the reality of power in its hands had itself all but entirely ceased actually to represent the counties and boroughs. He points out what exceptions remained to a system which had radically undermined freedom of election—he might also have pointed out that exceptions are to be noted, in the reigns of the first two Georges, to the *fainéant* character attributed to their royal authority in general. Practically, as he observes with truth, the English people long remained indifferent to the dependence of the House of Commons upon the aristocracy—a dependence established in defiance of the principles to which the House owed its origin—because the predominant Whig party fairly represented the views of the great majority of the nation. It was forgotten that the attempt might still be made to subject Parliament to a royal authority resting on very different conceptions of its proper character from those which in England alone had come to prevail, and to make the Cabinet a mere instrument of the royal will; and it was likewise forgotten that the House of Commons itself might some day be found in opposition to the wishes of the nation, whose control over it—of whatever kind or degree—had been so greatly weakened by the Septennial Act.

The attempt to make these dangers a reality was, as Professor Brockhaus says, reserved for King George III.; but it may be observed that the maxims he was taught by his mother and Lord Bute had been already preached to his more or less lamented father by Bolingbroke; and, in effect, if not in name, George III. sought to carry out what was of real significance in the conception of the Patriot King. The Whigs had broken up into fractions, as the modern political phrase is; the Jacobites had become a merely sentimental party after Culloden; and the loyal [illegible] were without a competent leader. It seemed a propitious moment for the [illegible] prepared to second the ambition of the Crown, [illegible] (not perhaps all quite so worthless as

* *Die Briefe des Junius.* Von Professor Dr. Friedrich Brockhaus. Leipzig. 1876.

Professor Brockhaus assumes) was formed the party, or faction, or clique of the King's Friends. But it was easier to form a party than to bring it into power, and easier to bring it into power than to maintain it there. Bute had supplanted Pitt; but Bute was overwhelmed by his unpopularity; the King was gratified by the successive overthrow of Grenville and of Rockingham; but the name of Pitt was still necessary in order to conjure a new Ministry into being. His Cabinet was little to his liking, and soon the Earl of Chatham left his colleagues to shift for themselves. The Duke of Grafton was now really as well as nominally at the head of affairs, supporting himself as best he could by the aid of the Duke of Bedford and his section of the Whigs. The elections had at last produced a majority with which the King might think himself able to govern as well as reign; and a Government was in power composed of King's Friends and of the least popular section of the disorganized Whig party. Quite apart, therefore, from the questions which soon arose, the situation was a critical one for the constitutional life of the country; but it is only just to remark that its difficulties were in part due to the conduct of Chatham, of which the determining principle at this time was certainly not the maxim that the King's Government must be carried on.

In the second section of his essay Professor Brockhaus describes with equal terseness the situation of the English press at a time when the tendencies of the Government in power were certain to call for its criticism. He shows with great clearness how the real insecurity of the press consisted partly in the obscurity surrounding the law of libel, with regard to which Lord Mansfield and the chief legal authorities of the day held that the question as to the libellous or non-libellous nature of a publication was one, not for the jury, but for the judge. He secondly shows that an even greater danger lay in the view of the privilege of Parliament taken by that body, and briefly explains the nature of the case of Wilkes, which gave rise to the first Letter of Junius. It attracted little attention; but the second, which comprised a general attack upon the Cabinet and a series of invectives against its members, at once made Junius famous. Sir William Draper furnished the materials for the first episode in the drama; then came the turn of higher game—the Duke of Grafton, the Duke of Bedford, Lord Mansfield—and, in that letter which made Burke's blood run cold in his veins as he read it, the King himself. The *Letters of Junius* belong to a class of literature which admirably lends itself to quotation; but we are surprised to find how much of their strength—and sometimes they may be called *merum acetum*, as Addison called Pope's poem *merum sal*—preserves itself in Ruge's German translation.

Into the more personal questions touched upon by Professor Brockhaus, or into the literary characteristics of Junius and the familiar comparison between his style and that of modern journalism, we cannot enter. The most interesting part of the book before us is, to our mind, its fourth section—on the political doctrines of Junius. It is here shown with great force—and doubtless the truth requires to be insisted upon towards a German public, whose acquaintance with the history of English political questions must necessarily have its gaps—that to regard Junius as a democratic revolutionist is an "enormous error." Far from seeking to tamper with a single institution, he defended the opinions he advanced by appealing to positive law and its rationality—not to comprehensive political theories, but to the actual evidence of history. He asked for nothing new; and if he reminded the King of the insecurity of his throne, it was merely that he demanded a return to constitutional principles older than the Hanoverian dynasty, itself only the creature of the law. Nowhere does he impugn the existence of the royal dignity itself, or quarrel with the measure of authority which the Constitution has left to the Crown. Nor does he attack the aristocracy as an institution, or direct his invectives against the aristocratic character of the national government. He nowhere, as Professor Brockhaus well puts it, "confounds the ideas of aristocracy and oligarchy"; it is the latter and its personal representatives which he combats. Even the actual working of the Parliamentary machine he subjects to no radical criticism; he is against the abolition of the existing system of boroughs; and the proposal he pressed upon Lord Camden in the last of his letters, for the substitution of triennial for septennial Parliaments, was not, historically speaking, an innovation. We pass by other topics on which "Junius" adhered to Conservative views in a narrower sense of the term. The changes in English political life which his advocacy largely contributed to establish were *no* new political theories and no constitutional innovations. Positively, he asserted the power of public opinion through its most adequate exponent, the anonymous press; negatively, he helped to bring about what Sir Philip Francis at all events lived to see, the abolition of the old view of the law of libel. The present state of that law possibly has its weak points; but, to whatever purpose it may be put, it can no longer be used as an instrument in the hands of irresponsible authority.

Professor Brockhaus's observations on the ethical character of the *Letters of Junius* are at once generous and temperate, but from the nature of the case they may here and there require modification. For ourselves, we confess that the question of the identity of "Junius" seems to us inseparably mixed up with the significance of much of his personal invective. But, leaving this aspect of the question aside, and judging him as we might judge of any public writer, we simply hold that the case is only one more illustration of the futility of the distinction sometimes drawn between the public and the private morality of a public man. Nobody but a pedant will pursue the same *method* in the conduct of his public as in that of his private life, when the conditions under which he has to act or refrain from acting, to speak or be silent, to combine with or sever himself from others, are so totally different. But the principles remain the same. The unmeasured arrogance and the uncontrolled ferocity of Junius are vices in a public writer as they are in any other man, though in the case of the former there may be something to excuse and must be much to encourage them. His utter incapability of reconsidering a question or a character on which he has once made up his mind is not the mere exaggeration of force and consistency of principles or opinions; and his unscrupulousness in the choice of the particular means by which he seeks to convey his general impression to the public is not reconcilable with a nice sense of honour. The conduct of Junius towards the Duke of Bedford seems to us to be that of what in a different sphere of action is called by an ugly name—the conduct of a bully. We are not speaking of mere offences against good taste or even good feeling; for the one is a varying sentiment, and even the other may sometimes seem to be all but necessarily submerged in the torrent of indignation. But malignity springs from a tainted source; and of this the writer of the *Letters of Junius* cannot be acquitted. We are not, we may say in conclusion, of the opinion of those who think that their literary merits have been overrated; but their historical significance must always remain their first title to immortality, and to this we are glad that Professor Brockhaus has in so competent a manner directed the attention of his countrymen. Such endeavours, whether made in Germany or in England, to bring home to the public of the one nation something of the historical life of the other, are in no case likely to remain altogether labour lost.

THE ONE FAIR WOMAN.*

THERE were people who said of Mr. Joaquin Miller's *Life Among the Modocs*, which was supposed to be a narrative of facts, that it was a brilliant piece of fiction, and we confess to having held this opinion for some time. But, having made acquaintance with *The One Fair Woman*, which professes to be a romance, we are disposed to think that *Life Among the Modocs* must have been strictly true. The author's present work is remarkable for an utter want of invention, of plausibility, of construction, of coherence, and, in short, of every quality that is desirable in a novel. It is a book the reading of which makes one profoundly wretched. There is in it just enough cleverness and interest to irritate your attention, and make you hope after each page of skimble-skamble stuff that there will be something really good in the next. You go on struggling through the chaos which Mr. Miller has put before you, trusting that you may at length come upon some glimmering of a plot, some flash of nature; but you go on in vain. The effect of the novel is like that of a bad dream in which you are constantly pursuing some object which as constantly evades you.

The hero of *The One Fair Woman* is a young painter with the singular name of Alpho Murietta, who, "boy as he was, was scarred all over by battle"; whose manner was "gentle, engaging, almost childlike"; who had a singular face, "half-hidden in blonde and abundant hair that hung to the shoulders"; a face "that men would paint, would see without knowing it"—whatever that may mean. And still we are told that this face "was not beautiful, not by any manner of means." Another peculiarity about him was that, "though he was the soul of virtue, his heart lay broken in bits and scattered like clay all over the world where he had wandered." Why his being the soul of virtue should be at variance with his heart being broken, or in what form clay is generally found scattered all over the world, is not stated. The most remarkable assertion made by the author about this wonderful young man is that, "with all that"—that is, with all the bits of his heart which were scattered—"he had never yet met the one great woman of his life, the one whom somehow he felt was standing somewhere." We are left to infer that when he did meet the one woman *whom* was standing somehow somewhere he would pick up the scattered bits of his heart from various parts of the world and lay them at her feet. Of course he did meet this one woman with great appropriateness, "face to face in of (*sic*) the highest circles in the world." When he met her his first action was to run away, and after that his next impulse was to take a man who knew her by the collar, and turn his face to the wall in a dark place, and then make him say who she was. "This," observes the author, "I should say, is love—love deep, self-denying, yet uncontrolled." We may be thankful that this is not a general opinion. He was saved the trouble of assaulting this man, however, by the man telling him of his own accord who the one fair woman was. In the course of the same conversation the man informed the painter that he was supposed to be insane; and apparently there was some ground for the supposition, as, on receiving this intelligence, Murietta went straight off to the India Docks, and embarked on a ship starting for Genoa, where he arrived "without even a hat-box in the shape of luggage. Happy man!" says Mr. Joaquin Miller. We should be inclined to substitute another epithet.

At Genoa Murietta asks the Consul to show him some miserable people, and the Consul takes him to the public drive, which is full of carriages. This gives the author an opportunity for some moral

* *The One Fair Woman.* By Joaquin Miller. 3 vols. London: Chapman & Hall. 1876.

reflections on the drive in Hyde Park, of which the grammar and sentiment are alike striking:—

He sits as if he was bolstered up in bed, and his physician was feeling his pulse. He is so stiff that you might imagine him chiselled from some sort of very ugly stone, hat and all. You had almost as well expect to see a Grenadier guardsman lift his bearskin cap as to see an Englishman's hat move from his head, unless a royal personage appears, while he takes this mournful round in the great ride of the kingdom. The marble head of Julius Cæsar is about as likely to fall from the shoulders of the bust in the British Museum, as is the head of an Englishman to turn to the right or the left as he sits there, holding his hands so stiffly, looking so stern, so pitiful, as if he was expecting every moment to hear that melancholy physician say that he must die to-morrow.

The poor stand on the outside, fifty deep, and look on in silence at this pageant of black solemnity.

He goes on to say that the people driving all wear "the same doleful doomed expression—the indescribable expression of the damned." This reminds one of the celebrated party in Peter Bell, who were (we quote from memory) "some drinking punch, some drinking tea, and by their faces you could see all silent and all damned." There is also an anecdote of a child looking at this drive who "tiptoed up," a strange action which Mr. Miller's characters constantly perform, and said to her mamma, "O mamma! see! what a pretty, pretty funeral!" From this the author takes us back to Genoa, and finishes a chapter with an incident which, besides being told in his usual bad grammar, is marked with a slight touch of profanity. The painter's first adventure in Genoa is to meet with a lady who is spoken of throughout as "the pink countess," who is supposed to be mad, and who goes about with a weak husband and a big admiral, in describing whom Mr. Miller has, as he has in other cases, feebly imitated Dickens's trick of labelling a personage, so to speak, with a catch-word. The big admiral never speaks to any one without announcing that he is a rough but honest sailor, who carries his heart in his hand. Another character, an American missionary, is constantly described as a tombstone, and also, with strange confusion of metaphor, as an Indian bow just ready to shoot an arrow, which is represented by his umbrella. Thus, when the missionary straightens his back we are told that "the bow slowly relaxed, for the tombstone felt that it had not this time made a centre shot." That such nonsense as this should be written by an author who has done some good work is almost incredible. Here, to make the tale complete, is another miserable attempt at reproducing Dickens's manner. It is necessary to state that from the context the passage seems intended for a description of waiters taking away breakfast:—

The curtain was raised, or at least two actors entered here, bowing gracefully, dressed in splendid stage array, and bearing aloft a tray in each right hand, as they glided sideways towards the table. The china and the teaspoons met in convention on these trays, talked for a moment in an undertone; the stray bits of bread gathered themselves together as these graceful actors moved their hands over the linen. The trays lifted up light as balances: the graceful actors bowed and edging sideways were gone, and the curtain seemed to come down and the piece was over.

There would seem to be some mystery connected with "the pink countess" of whom we have spoken; but we confess that we have been entirely unable to discover what it is. She gives Murietta, when they meet at breakfast, a description of Nervi. He replies, "I will go to Nervi, lady" (this, we may observe, is his usual form of address), and is in the middle of an enthusiastic speech when the big admiral comes in. Upon this the pink countess trembles, and the artist, with needless excitement, says, "Lady, do not fear; do not move unless you desire. No hand shall—no tongue shall insult you here." The countess, however, goes away with her husband and the admiral, and the painter is left in a state of rage and perplexity with which it is difficult to sympathize. This kind of thing goes on all through the book; the countess is perpetually going to make some revelation to Murietta, and Murietta is constantly at her heels; but what it all means is known only to Mr. Joaquin Miller. Some time after this the painter sees the one fair woman, who luckily is not the pink countess, on the side of Vesuvius, and manages to drop some roses on the road she must follow, after which he repeats with imbecile iteration through five or six pages, "I scattered roses in her path," and then makes up his mind to go to Barcelona in order to get killed. But there are certain difficulties in the way of getting there which seem to be introduced as an excuse for a chapter called "An Innocent Duel," which is filled with a painfully—we might even say disgustingly—minute description of Murietta and the Minister's Secretary blowing the smoke of cigarettes through their nostrils. Murietta does not go to Barcelona; he takes instead an obscure lodging in Rome, kept by four countesses in their own right, and their father, who is a manufacturer of antiquities. Here he paints a picture of the one fair woman and is attacked with Roman fever, upon which a ludicrously impossible scene takes place between him and a doctor, who, accompanied by a prince, asks an exorbitant fee, and is made to reduce it by Murietta, in his sick bed, pointing at him "a little bull-dog of a pistol" which "stuck its nose out, thrust it forward, way out in the face of the two men as if it was just about to bark, as if it was positively anxious to bark. It seemed as if it could hardly keep from barking right out." This brings Mr. Miller's first volume to a close. The most remarkable passage in the second perhaps is this, which, on account of its touching modesty, we cannot refrain from quoting:—

It seems to me as if a man could stand before this immortal creation and repeat literally the lines of Lord Byron on the Dying Gladiator, although he had never heard or read the lines in his life.

Once a poet stood before this figure and looked at it long and earnestly. At last he said with a sigh, "Byron has done me more wrong than all the world together; he has ruined my future, for if he had not written those poems of his, I should have written them, and it seems to me I should have written them, and written them just as he wrote them."

Mr. Joaquin Miller did at one time show that he could write poetry, which we do not think, however, was equal to Lord Byron's. It is a pity that he has abandoned poetry in order to write such a jumble of nonsense as *The One Fair Woman*. In his second volume there appears a certain Miss Mollie Wopsus, from California, who is intended to be a fresh and amusing character, and who is really one of the most tiresome and disagreeable persons ever invented. She is courted by the wicked prince who visited Murietta with the doctor, and there is a mysterious plot among the many mysterious villains of the book to assassinate the painter. Speaking of this to the pink countess, he says, "You are a honest (*sic*), true little lady. You will say to the Count that Murietta knows what he is waiting for." Subsequently he again meets the one fair woman, who is gifted with "a quiet Latin laugh," whatever that may be. Before describing this meeting the author observes that "it is very hard indeed to write a romance altogether out of facts," and he goes on to say, "these real people are hard to handle. They are not exactly what you want. They sometimes persist in being intolerably dull and uninteresting." This is only a half-truth; Mr. Joaquin Miller's people are not at all what we want, and they always persist in being intolerably dull and uninteresting.

It is needless to follow Murietta any further through the mazes of this extraordinarily foolish book. There are here and there good bits of description to be found, and such quaint sayings as that "Naples is the poorest place for something to turn up in outside of a tomb"; but they occur at very rare intervals in a mass of imbecility. There is also one passage in the book which it is astonishing to find written and printed in volumes that may be supposed to make their way through circulating libraries to decent readers.

LOTHIAN'S DANTE AND BEATRICE.*

ONE thing was omitted by Dante in the *Vita Nuova*, probably as being superfluous. He wrote in it no imprecation of the wrath of the Muses, or of the glorified Beatrice herself, on any one who in time to come should lay rash hands on the mysteries of which Dante himself thought fit to show the world so much and no more. Any such attempt would seem beforehand most unlikely to be made, for this is not one of the subjects that lie in the common beat of the mercenary and superficial literature which sticks at nothing for want of knowledge; nor is it a promising one for that kind of treatment; and in the case of those to whom competent knowledge is not wanting, one would naturally expect, as the fruit or accompaniment of the knowledge itself, a measure of taste and discretion sufficient to prevent the design from being entertained. And in truth, so far as we know, Dante's Beatrice has had the good fortune to be left in peace for all but six centuries, save for those ingenious persons who have done their best to reduce her to an allegory of Philosophy or the Holy Roman Empire. It was reserved for Mr. Roxburghe Lothian to fall at length into this open trap through unripe knowledge and indiscreet zeal. It would be difficult to find a task more unfit and ungracious in its own nature than composing an historical novel of the regular type on the theme of the *Vita Nuova*. In the first place, it is a canon generally observed by the masters of this kind of writing, though not without exceptions, not to choose the hero of their story from among the greatest names of the day, but rather to take a less known or fictitious person, whose life may be freely handled by the romancer, and interwoven with the historic interests of the time in whatever manner may be most convenient. To take only one example from another modern novel whose scene is laid in Florence, George Eliot knew much better than to make Savonarola the hero of *Romola*. The fiction should be set off as a distinct set of images on the historical field, not confused in it. Historical romance may be not only excellent as art, but even a real help to history. Romantic history is seldom, if ever, tolerable. This is one almost fatal objection to Mr. Roxburghe Lothian's undertaking. Another, and a yet graver one, is that his book is from beginning to end an inexcusable violation of the whole spirit of the *Vita Nuova*. So far as Dante's own witness goes, we know of the love of Dante for Beatrice, and that only. Mr. Roxburghe Lothian has made up a story of the loves of Dante and Beatrice, and no doubt it would have been more difficult to make it otherwise; still this is a wholly different thing, and wholly unwarranted. Notwithstanding this author's speculative inferences from the later works, there is nothing whatever to show that Dante's love was returned, or that he ever had any definite hope that it would be returned. All that he tells us is consistent with Beatrice never having spoken to him in her life; and though he gives us little ground for positive inferences, that little is against the supposition that there was anything like intimacy between them. The celebrated passage where he describes the blissful effects of his lady's passing salutation would be little better than frigid hyperbole if we were to take it as the language of one who not only exchanged distant greetings but walked and talked with her. Again, he says in plain words that she joined the other ladies in mocking his discomfiture when he saw her at the wedding feast. This is pretty decisive against her being other-

* *Dante and Beatrice, from 1282 to 1290: a Romance.* By Roxburghe Lothian. 2 vols. London: Henry S. King & Co. 1876.

wise than indifferent to him at the time; and if the conjecture be right that this wedding was no other than Beatrice's own, the case is even stronger. This conjecture is tacitly adopted by Mr. Lothian, who of course has to suppress the incident of the mockery, notwithstanding the prominence given to it by Dante. But even if we were quite free to assume, in the face of these indications, that other things happened than are told or suggested in the book, it is at all events a fact that, if any such things there were, Dante has studiously forborne to report them. And the man must have a singular confidence in his own artistic judgment who takes upon himself to speak at large where Dante was deliberately silent. This indeed is of greater importance than the conclusion we may come to on the question of actual fact. It is not that a writer of historical fiction is bound by facts as such, but that he is bound for artistic reasons not to depart extravagantly from the outlines given him by his materials. He must not be paradoxical or controversial. It may sometimes be an artistic fault even to correct an admitted vulgar error. Now in this case argument is needless to show that the peculiar charm of the *Vita Nuova* consists in no small measure in the distant and almost unearthly character of the poet's devotion, worshipping his lady as he does afar off, with scarce any reward or hope, and with a love which at the last was to blend into the divine intellectual love of the philosopher and theologian rather than be supplanted by it. Such is the picture presented to us. Whether the manner of it is due, as we incline to think, to its substantial truth, or rather to the poet's designed reticence, may be left an open question. And it also seems to us that, as a matter of artistic feeling and reverence, any one who takes up the subject after Dante should hold himself bound not to depart from the general tone in which Dante handled it. Of course a novel-writer is free, in a certain sense, to make Beatrice desperately in love with Dante, and to give us all the usual apparatus of proud parents, duennas, contrived and casual meetings, speeches, protestations, despairs, and farewells as Mr. Lothian has done; but he is almost or quite as free, in the same sense, to make Beatrice marry Dante and live happily ever after—perhaps in Egypt, after the example of Helen, leaving a phantom Dante to be exiled and write the *Divina Commedia*.

For these reasons we are compelled to disapprove of the whole plan and purpose of Mr. Roxburghe Lothian's romance. In our eyes it is unhappily so misconceived that there is little profit in dwelling on the details of it either for praise or for blame. From one reproach at least the author is free. He cannot be charged with ignorance: on the contrary, he seems to have been very diligent and sufficiently exact in gathering information. He is apt, indeed, to be too manifestly well informed; for several of his chapters are overloaded with antiquarian descriptions, digressions, and references, which are all the more out of place that a proper place for such matter is actually provided in a set of notes at the end. Here, again, he might have taken a lesson from George Eliot, whose knowledge is always full and exact, but never obtrusive. He is at times loose in his manner of citing authorities, and allows himself some rather wild talk about Freemasonry; and he exceeds the bounds of likelihood in the knowledge of Greek literature and foreign learning which he ascribes to Dante and his contemporaries. Aristophanes and Euripides can hardly have been frequent in the mouths of Tuscan abbots and chaplains at that time; and we doubt whether Dante would have readily called to mind in a moment of critical emotion the observances of Brahmans and Buddhists, if indeed he had any but the vaguest knowledge that such people existed. And one is certainly surprised to find Dante pouring out his indignation in several pages of essentially Protestant soliloquy, supported in a note by reference to various passages in the *Commedia*, which only denounce the abuses of the temporal power of Popes and other princes. But Mr. Lothian, acting on the slight and obscure hints that have come down to us of Dante having been at some time or other accused of heresy, has worked up a full and startling underplot of secret correspondence, wicked Franciscans, inquisitors, and what not. He entangles Beatrice likewise in these affairs, and represents her as dying for love of Dante only just in time to escape the Holy Office. All this, however, is matter of discretion. We cannot say that any of it is impossible; though, as to the *Credo* of Dante, when Mr. Lothian says in his notes, justly enough, that a versification of the merest elements of the faith could not well have satisfied the Church at any later time of Dante's life, one is tempted to suggest that it was not very likely to be accepted as a justification even from a young man if the charge against him was, as Mr. Lothian puts it, that he knew too much. The whole invention seems to us, we confess, forced and unpleasant; but there may be those who think otherwise. We are more gravely surprised when we find that Mr. Lothian is not content with introducing translations of two or three of Dante's poems, but has no hesitation in composing new ones for him, and in particular some despairing stanzas which Dante sends to Beatrice on her wedding-day. The effect of the original verses, whatever merit they might have if they professed only to be the author's own, is naturally disappointing; and we think he would have done as well to be content with Mr. Rossetti's English for the translations. On the whole, we can only part in sorrow from a record of labour well intended and well furnished with the proper means, but applied in a mistaken direction. The materials of which Mr. Roxburghe Lothian has made an unsatisfactory novel might have been worked up into a respectable historical essay.

DAVILLIER'S LIFE OF FORTUNY.*

FORTUNY, who suddenly appeared and disappeared on the horizon of our contemporary art, presents so startling a phenomenon in the history of painting, that this Life, with correspondence and added illustrations from the hand of an intimate friend, will be read with something more than curiosity. We do not say that the enigma of the eccentric and assailant art which excited astonishment amounting almost to dismay in Madrid, Paris, Rome, and London is now actually solved. Still, when we are here once more reminded of Fortuny's nationality in common with Goya, the Hogarth of Spain, of his family relationship with Señor Madrazo, perhaps the greatest necromancer on canvas in Europe, of the encouragement he received from that most brilliant and blatant of French art critics, M. Théophile Gautier, of his alliance or sympathy with the archfiend of caricature, Gavarni, with the withering cynic, M. Gérôme, and with the microscopist in manipulation, M. Meissonnier, it cannot be very difficult to divine whence the devilry of Fortuny came. History scarcely affords a parallel to this collective manifestation, which we will not dignify as a galaxy of talent, but must rather call the perversion of genius. Neither will we say that this is an art stimulated by revolution, backed by barricades, or fed on massacres, for such in some measure was the dramatic art of Géricault, Delacroix, Decamps, and even of Delaroche. But the inspiration of Fortuny and his fellows was taken from the frivolity of salons, the frippery of fashion, the finery of milliners' shops. His gaily dressed figures are little more than painted marionettes; they have about as much of humanity within them as a collection of clothes-horses. As for the sentiment or dialogue, it is that of daggers, stratagems, and intrigues; there is nothing here more serious than a sneer; the laughter is without joy, and the tears are those which crocodiles are supposed to shed. And yet it must be confessed that the manner after its kind is supremely clever.

The life of the artist is not quite what might have been expected from the somewhat feverish and flashy character of his pictures. Fortuny, born to poverty, was tried in the school of adversity; he lived severely as a Spartan, and won his way by hard, steady work. His first experiences in art came when, as a boy, he assisted his grandfather—a puppet showman—in the painting of wax figures which were carried about in a cabinet as a sight for the villagers in his native district of Tarragona. And his biographer relates that when in London, at Mme. Tussaud's Exhibition, as recently as last year, Fortuny, tapping him on the shoulder, said laughingly, "And I also in my time have painted such figures as these." The young artist's first independent success was in the way of costume paintings of Spanish peasants; later on, he rushed for a while into religious subjects, composing, after the Peninsular custom of the olden times, Immaculate Conceptions, the Madonna going up to Heaven, and such like. But this sacred occupation is to be accounted only as a slight episode in the drama of a life which, opening as we have seen with wax puppets, found its fruition in "Les Charmeurs de Serpents," "Le Marchand de Tapis," "La Siesta," and "La Plage de Portici."

Fortuny soon left religious art, and found his true vocation in the line of Southern and Oriental *genre* painting on the breaking out of the war between Spain and Morocco. Unlike another famous though involuntary visitant to the African coast centuries before—the notorious Fra Filippo Lippi—he forsook Madonnas and saints for the rest of his life. But on the threshold of his voyage Fortuny found himself met by a difficulty not unfrequent in his too short career; poverty was the first, as ambition became the last, infirmity of his noble mind. When sent as a prodigy to Rome, being without money, funds had to be provided; afterwards he painted a great picture, but the materials were first paid for by others. In Morocco he endured all sorts of privations; he suffered from hunger, he slept on the bare ground, and, brave as a lion and wishing to know what a battle was like, he advanced so near to the scene of action as barely to escape being shot down. "Ah," said a soldier by his side, "that ball was meant for the artist." On another occasion he was taken prisoner by the Moors, who fortunately let him off on the ingenious plea of a friend that he was English:—"Oh, yes. *Yo Inglis!*" The Spaniards for once gained a brilliant victory, and Fortuny had a fine opportunity on the battle-field of making studies among the dead and the wounded. The horrors, however, proved a little too much even for a disciple reared in the national school of bull-fights. During a sojourn of two months and a half in Morocco he made a great quantity of drawings, both in oils and water colours, of Arab soldiers, Catalan volunteers, Jews, peasants, horses, landscapes, historic monuments, and domestic interiors. He must have had a ready and rapid hand to get through so much in so short a time. The fruits of the journey were received with rapture by his friends in Spain, who, under a sense of the honour conferred by such talent upon the nation, sent him again to Morocco to renew his impressions and gain further materials. These journeys, we cannot doubt, coloured the imagination of the painter. Nowhere else could he find such a combination of majestic pride and abject poverty, such picturesque compounds of finery and of filth. His art became little more than decorative; sunlight, and especially scintillating colour, were its highest attributes. The artist's mode

* *Fortuny: sa Vie, son Œuvre, sa Correspondance.* Avec cinq dessins inédits en fac-simile et deux eaux-fortes originales. Par le Baron Davillier. A Paris: chez Auguste Aubry Éditeur-Libraire de la Société des Bibliophiles françois. 1875.

of life, partly from necessity, but still more from choice, was Bohemian; his art too was expressly Bohemian; even when approaching historic subjects, it seldom rose above anything more momentous than some minor incident which in anterooms or on back stairs might bring ruin or ridicule on a house or a nation. The most brilliant of manipulation and the richest of costume can scarcely redeem ideas which do not escape frivolity.

London, the great mart of the world, has naturally found an auction-room for Fortuny. It is easy to understand that works rapidly rising to speculative prices have offered unaccustomed attractions to the class whose profits lie in alternate transactions with needy artists and rich connoisseurs. For at least five years past pictures by Fortuny have been familiar to London dealers as the best and latest means of bringing the purchasing public up to that sensation pitch at which pockets are opened freely. But the speculators know themselves to be safe on a rising market, and when the sale came on in Paris of the painter's remainders, the prices realized proved far in excess of what his heirs could have hoped for. The unfinished works fetched upwards of 16,000*l.* A well-known admirer bid up to 98,800 francs for the "Beach of Portici," at which sum it was knocked down to him. We also learn that microscopically small and very incomplete studies went at prices varying from 3,000 to 7,000 francs a piece. A mere sketch of a Spanish Hidalgo, supposed to be of the time of Charles V., measuring only four and a half by two inches, sold for 4,100 francs; and the "Madrid Procession caught in the Rain" was bought by Messrs. Goupil for 20,000 francs. Such is the height to which folly may fly.

The success of Fortuny was a marvel even to himself. He could not understand how his pictures fetched such amazing prices. Strange to say, his own country is almost denuded of them, because Spaniards, being of late years stricken with adversity, have not been able to resist the temptation of realizing exorbitant profits on sales. But Fortuny, to his credit, does not appear to have been quite content in the midst of his prosperity. He wished to extricate himself from the commercial, social, and other penalties incident on popularity. He desired to raise his too decorative art into a higher and more sober sphere. The following extract from a letter from Rome to his biographer, dated as recently as April of last year, reveals the conflict between misgiving and aspiration which often proves the torment of sensitive genius:—

Je vous dirai, pour changer, que je continue à travailler; mais, en vérité, je commence déjà à être un peu fatigué (moralement) du genre d'art et des tableaux que le succès m'a imposés, et qui (entre nous) ne sont pas l'expression véritable de mon genre de talent. Avec la grâce de Dieu, et dans l'espoir que le résultat de mes derniers tableaux sera favorable, je pense me reposer un peu. . . . Je fais tout mon possible pour aller passer quelques jours à Paris; et je voudrais aussi aller à Londres pour voir les musées et recueillir des documents pour mes tableaux.

We have often heard stories as to Fortuny's sumptuous studio in Rome. Connoisseurs, and what is worse, the hordes of vagrant English and Americans who make Rome a kind of Italian Brighton, went to his studio as to a show. The artist had about him a sort of romance which the ladies, according to their wont, coloured up far beyond the pitch of sober truth. He assumed at the outset, as we have said, a Spartan austerity, with the cold ground for a bed, and a crust or at most a hard-boiled egg for a dinner. But when prosperity suddenly overtook him he became a Sybarite. Once the recipient of charity, he grew, as a surprise to himself, into the patron. Tastes at first rude and wholly without the means of culture or indulgence were soon polished up, at the pleasant incentive of money reward, to the pitch of tapestries, enamels, and ceramics—the acknowledged infirmities of our successful London Academicians, especially our portrait-painters. Such frailties scarcely need apology. Fortuny, once a Stoic, glided without much difficulty into an Epicurean, and, like other artists in Paris, Berlin, Vienna, and London, he naturally made his studio the echo of himself. Things of beauty, with all appliances ministering to sense, came as fitting surroundings to his pictures. It must be added that the best ornament to the studio was his own wife, the daughter of Señor Madrazo, to whom we owed thanks in years past for politeness as Director of the Madrid Picture Gallery. The studio receives less than justice from Baron Davillier in the following extract:—

Son vaste atelier, où il avait disposé avec un goût exquis ses splendides étoffes, ses faïences au reflet d'or, ses armes anciennes et mille autres objets curieux, était une véritable merveille de décoration, et avait pris rang parmi les curiosités de Rome, trop souvent même il lui attirait des visites importunes.

Fortuny died of Italian fever at the comparatively early age of thirty-six. His friend and partial biographer naturally pleads that he was struck down just at the moment when new and great developments of his talent were imminent. This we do not believe; as the tree grows, so it falls. Fortuny never laid a sure foundation in the study of the human figure, without which his art was essentially poor and trivial. Fortuny's end was not as a flame flickering in the socket; it might rather be likened to a flash in the pan. The moral seems to be that when the art cannot live the artist must die. To this obituary of Fortuny must be added the deaths of his friends—MM. Zamacois, Regnault, and Giraud. Early death is said to come as a gift from the gods, but artists who may wish to live long will do well to take warning from Fortuny; a frivolous and superficial art is short—that which lives lies less on the surface.

FROST'S LIVES OF THE CONJURORS.*

THERE is an air of freshness about the subject of this book which seems to promise a journey into hitherto untrodden regions of biography—regions which may fairly be expected to abound with strange character and novel incident. But the promise of the title-page is by no means borne out by the work itself. We have barely been introduced to one of the heroes of the magic wand, and begun to feel a dawning interest in his character and fortunes, when, presto!—the scene changes. The hero of the moment is disposed of in half-a-dozen lines, and another takes his place, to be dealt with in an equally summary manner. The reader's prevailing sensation is that of being led into a succession of literary *culs-de-sac*, and of perpetually making fresh starts, only to find "no thoroughfare" in another direction.

Mr. Frost begins with the magicians who contended with Moses before Pharaoh. This is a very legitimate starting-point, though we cannot say that much information is afforded us concerning the "Lives" of the wonder-workers in question; but the reason given by Mr. Frost for going back so far is at least original. He tells us:—

Modern conjuring receives so much illustration and elucidation from the similar exhibitions of antiquity and the middle ages, that a relation of the lives and feats of conjurors, commencing with Neve, would have not only been as imperfect a record as was presented by Godwin, but have been deficient of the interest which is imparted to the subject by the light thrown upon the marvels exhibited by conjurors of our own day by the knowledge of those performed by the magicians of the ancient and mediæval worlds.

We have carefully examined this remarkable sentence, which reads like an extract from one of the *amphigouris*, or burlesque addresses, in which Comte and other conjurors of fifty years ago delighted to indulge. If it means anything at all, it must mean that the performances of Pharaoh's magicians, the Witch of Endor, and Simon Magus, all of whom are discussed in due course in this book, will be found useful in throwing light on the modern miracles performed by Dr. Lynn, Messrs. Maskelyne and Cooke, and their brethren of the present day. We doubt whether such a curious piece of inverted logic was ever before propounded. Mr. Frost would have his readers judge of the seen by the unseen, of the known by the unknown. We pass over the unconscious humour of looking at trade secrets, to be bought with a price, as problems to be approached in a spirit of scientific inquiry; but surely it is a most unheard-of way of conducting such an inquiry to seek the explanation of facts actually before us in other facts of which we have only a vague tradition. We fancy that most persons witnessing a magical entertainment would find their enjoyment marred rather than increased by discovering the secrets of the tricks which have bewildered them; but we are certain that any inquiring spirit, eager to solve the mystery of some clever illusion, would not seek for "illustration" or "elucidation" in the signs and wonders of the magicians of the Old Testament or in the mythical achievements of Albertus Magnus or Cornelius Agrippa.

The first five chapters of the book deal with the dark ages of the magic art, when conjurors were wont to profess direct dealings with the Devil, and thereby gained much profit and respect, subject to the slight drawback that they were occasionally burnt. During this period, and indeed down to the beginning of the eighteenth century, the records of conjurors and conjuring are more or less mythical. From about 1700, however, and beginning with Fawkes, Pinchbeck, and Yeates, the conjurors of old Bartholomew Fair, our information becomes more trustworthy. Next in order, and better known to fame, come Jonas, Comus, and Breslaw, the last-named retiring from the stage about 1784, and shortly afterwards publishing his *Last Legacy*, one of the earliest treatises on the art. At about the same date the celebrated Pinetti made his first appearance before a London audience. In connexion with this performer Mr. Frost makes a brief reference to the *Magie blanche dévoilée* of Decremps, which was professedly an explanation of Pinetti's principal feats, and is said to have been provoked by a direct challenge from Pinetti himself. But to this work, which, full of errors as it is, formed for fifty years the basis of magical literature, Mr. Frost only devotes a single page; and to its successors by the same author, the *Supplément à la magie blanche*, the *Testament de Jérome Sharp*, the *Codicile de Jérome Sharp*, and the *Petites Aventures de Jerome Sharp*, he makes no allusion whatever. Neither does he relate, as he surely would have done had it been within his knowledge, the curious and characteristic revenge taken by Pinetti on the man who had thus sought to expose his secrets. We give the incident in the words of Robert-Houdin:—

Voici comment Pinetti se vengea de la publication de cet ouvrage; dans une de ses séances il se plaignit qu'un ignorant, un imposteur prétendait, dans la seule intention de lui nuire, dévoiler des secrets au-dessus de son intelligence. A ces mots un homme mal couvert et de mauvaise mine se lève du milieu de l'assemblée, et en termes grossiers apostrophe Pinetti, et offre de prouver que les démonstrations qu'il a données sont exactes. Le public, mécontent de voir troubler une séance où il s'amusait beaucoup, hue le pauvre diable et allait peut-être lui faire un mauvais parti, lorsque Pinetti s'interpose et met doucement l'homme à la porte, en lui glissant dans la main quelques écus. Cet homme était un coupe-père. Le lendemain Decremps voulut détromper le public, mais il ne put y réussir.

* *The Lives of the Conjurors.* By Thomas Frost, Author of "Circus Life and Circus Celebrities," "The Old Showmen and the Old London Fairs," &c. London: Tinsley Brothers. 1876.

The idea of manufacturing a dummy adversary, and through him striking at the real one, is one which could only have emanated from a conjuror's brain, and recalls the magical assassinations supposed to have been practised in the middle ages, wherein, by sticking pins in a waxen effigy, corresponding wounds were inflicted on the living prototype. A better-known incident of the same character, the ingenious and temporarily successful plot of Pinetti to ruin his rival Torrini, is related by Mr. Frost.

From Pinetti we proceed onwards, at the rate of about a dozen conjurors to a chapter, to the time of Jacobs and Anderson. Mr. Frost appears to be a disciple of the Tupperian philosophy, and to believe that

> The epitome of common lives is seen in the common epitaph—
> Born on such a day, and died on such another, with an interval of threescore years.

If he has succeeded in telling us where and when a given performer was born, at what date he gave his first performance, and what were his customary prices of admission, he conceives that he has given us a pretty complete biography. Comte, unquestionably the greatest performer of the last generation, is disposed of in a couple of pages. The elder Hermann, also a star of the first magnitude, occupies barely a dozen lines, while the younger Hermann, still better known to the present generation of English sightseers, having performed in this country for a great part of the years 1870–1871, is omitted altogether. Anderson, the Wizard of the North, and Robert-Houdin are highly honoured, each having a whole chapter to himself, these being almost the only instances in which anything like real biography is attempted. The space allotted to Anderson is, indeed, wholly disproportionate to his artistic merits. He was a good man of business, with a keen appreciation of the magic of advertising, and a thorough mastery of the art of puff. He was daring in his speculations, and, thanks to his business talents, having considerable capital at his command, never lost the chance of a telling effect on account of the cumbrousness or costliness of the necessary stage appliances. But as a conjuror he had little or no original genius, and with all his pretension left no mark whatever upon the magic art. Far otherwise was it with his contemporary Robert-Houdin. Trained to the prosaic occupation of a watchmaker, but with an inborn passion for natural magic which tinged every thought and action of his life, he spent the first years of his life in devising and constructing magical automata; and it was not until he was forty years old that he yielded completely to his vocation and came before the public as a conjuror. But from his very first performance he determined not to be fettered by tradition, but to introduce a new era in the art. The conjurors of his day were accustomed to attire themselves in flowing robes and eccentric headgear. Robert-Houdin discarded these, and appeared in ordinary evening dress. His contemporaries furnished their stages with heavy draped tables, in which an assistant might be, and occasionally was, concealed. Houdin suppressed what he sarcastically termed the *boîte à compère*, and decked his stage with light and elegant accessories offering no such possibility of concealment. An adept in natural as well as mechanical science, he pressed the resources of electricity into his service, and by means of this subtle power was able to indue inert matter with seeming vitality and intelligence. With Anderson little or nothing was original; with Houdin everything was original. Mr. Frost shows no appreciation whatever of the marked contrast between the two men, neither does he make any mention of Houdin's numerous contributions to mechanical and electrical science. Of one of these, the *répartiteur électrique*, a novel and ingenious combination of levers, a scientific writer in the *Cosmos* (vol. 7, p. 330), speaks as follows:—

> Au point de vue de la mécanique, c'est un organe entièrement nouveau, qui sera bientôt appliqué de mille manières différentes, à mille usages, et qui rendra d'innombrables services. Au point de vue de la physique et des applications de l'électricité, c'est une découverte immense. M. Robert-Houdin, dont les forces sont centuplées par son *répartiteur*, est seul aujourd'hui en mesure de résoudre le plus grand des problèmes à l'ordre du jour, de réaliser enfin le moteur électrique, etc.

Mr. Frost is in error in stating that the work promised by Robert-Houdin in his Memoirs, on the subject of legerdemain and its professors, never appeared. On the contrary, such a work, under the title of *Les Secrets de la Prestidigitation et de la Magie*, was published by Michel Lévy frères in 1868. The treatise is by far the best that has ever appeared on the subject of conjuring, but has for some years been out of print, and is not to be found in the British Museum, which may possibly account for Mr. Frost's ignorance of its existence.

Passing on from Robert-Houdin, the next name of special mark is that of Wiljalba Frikell, who in his turn introduced a new phase of the art. The staple of Robert-Houdin's performances consisted of illusions in which sleight of hand was subordinate to scientific and mechanical effects, and the use of elaborate apparatus formed a special and undisguised feature of his entertainments. Frikell, on the other hand, used ostensibly no apparatus whatever, and worked with the objects and materials of everyday life; not that he did in truth discard mechanical aids, but all his energies were directed to conceal their employment. In place of the showy boxes and vases of Anderson, or the elegant automata of Robert-Houdin, a simple-looking table and a couple of chairs formed the whole of Frikell's stage furniture; and bottles, coins, handkerchiefs, and other everyday articles were the subjects of his illusions. Since his day conjurors have fluctuated between the one school and the other; but the elegant simplicity, the *ars celare artem*, of Frikell will always find the highest favour with enlightened connoisseurs.

It will startle most readers to be told that the next performer of note, Colonel Stodare, was a Frenchman, though not perhaps more than to find it gravely stated that the "automatical character" of Kempelen's chessplayer "has been doubted." After this hesitating admission of doubt on a matter which most persons regard as admitting no question whatever, we are not surprised to find that Mr. Frost appears more than half inclined to believe in the genuine "automatical character" of Mr. Maskelyne's whistplayer, Psycho, to which he devotes a good deal of space. A memoir of Messrs. Maskelyne and Cooke, and brief notices of Dr. Lynn and Professor de Vere, conclude the work, which, notwithstanding many defects, forms a decidedly interesting book, and might have been much more so had the author taken the pains to procure original information instead of relying on narratives already in print. An author who undertakes to write the Lives of the Conjurors should surely show some little personal knowledge of conjurors, but throughout this book there is not a single indication that Mr. Frost ever exchanged half a dozen words with a conjuror in his life. Had he mixed in ever so slight a degree with the fraternity, not only would his book have acquired a vitality much beyond what it now possesses, but he would have avoided many glaring errors both of omission and commission. Of many of the magnates of the craft he makes no mention whatever, though we gather from an incidental remark in his preface that he conceives himself to have passed over no performer worthy of notice. We can overlook his omission of such minor stars as Méhay, Taylor, Matthews, Tolmaque, Hellis, Evanion, Max Alexander, Bernard Eagle, and Mme. Card, though all are more or less known to the London public, and might fairly claim a niche in Mr. Frost's temple of Fame. But such well-known artists as Basch, Buatier, Courtois, Cleverman, Robert Heller, Seemann, and (as we have already mentioned) the younger Hermann, are also conspicuous by their absence, and the reader is almost inclined to fancy that there must be a second volume which is somehow missing.

BEAMES'S COMPARATIVE GRAMMAR OF THE ARYAN LANGUAGES OF INDIA.*

SOME time since we welcomed the first volume of this work.† Mr. Beames claims indulgence for the tardy appearance of the second volume in consequence of his onerous duties in a remote province of India, an indulgence which will be readily granted to him. A book of this kind is a work of time even for one who enjoys uninterrupted leisure, and the process of printing it must necessarily have been slow. We are disposed to think this volume an improvement upon the first. It has less of dogmatism and theory, and more of fact and illustration, but it here and there bears that "unfinished appearance" for which the author apologizes, and which he attributes to his want of the necessary time. It may be well to recall to memory that the languages with which the work deals are the North Indian languages, seven in number—Hindi, Panjabi, Sindhi, Gujarâti, Marathi, Oriya, and Bengali. Hindi is the leading language of the group. It embraces a variety of dialects, and these have many variant grammatical forms which are of great importance for philological purposes. The first volume dealt only with "Sounds"—that is to say, with alphabetical matters; this volume is devoted to the Noun and Pronoun. First Mr. Beames examines the "Formation of the Stem" of the noun, showing how the original Sanskrit word has been cut down and shaped in the modern tongues, the inquiry being "entirely concentrated on the final syllable or suffix." The chapter devoted to this subject is the longest in the book. It is a very necessary one, but it naturally deals with small details rather than matters of wide principle and interest. The concluding section of this chapter on the Numerals is important and curious, for the numerals of the Northern languages of India furnish a very convincing proof, perhaps the most convincing, of the descent of these languages through the Prâkrits from Sanskrit. Languages of the Indo-European family generally start with the units from one up to ten, and then work out in their own way the successive numbers up to one hundred. Not so the languages of Northern India; they borrow the whole hundred ready made from Sanskrit through the intermediate stage of the Prâkrits, each word being modified and rounded off to suit the softer and shorter enunciation of modern days and the special peculiarities of each language. So the numbers from ten to a hundred, though they bear such a resemblance to their respective units and tens that no blunder can be made on seeing them, yet each number must be known by itself, as it cannot be formed by the combination of the ten and unit. It is obvious that this derivation of the numerals proves most distinctly from what source these languages sprang.

The chapter on Gender is instructive and interesting, as it exhibits the various efforts made by the modern tongues to get rid of this useless and troublesome element of the ancient language. The opening paragraphs of this chapter are not so satisfactory as they might be:—

> Gender [says Mr. Beames] is of two kinds, natural and grammatical. Natural gender is that which refers to living beings, and is threefold; there

* *A Comparative Grammar of the Modern Aryan Languages of India.* By John Beames. Vol. II. The Noun and Pronoun. London: Trübner & Co.

† *Saturday Review*, March 21, 1874.

being one form for males, a second for females, and a third for mankind or animals regarded as such without reference to sex. The human mind has, however, not rested content with this simple and natural use of gender, but has by an effort of imagination extended the distinction of sex to inanimate objects, abstract ideas, and, in short, to all nouns of every kind. All Latin tongues are not alike in this respect; some retain all three genders, others only two, and some have had the good fortune to emancipate themselves, entirely in the noun, and to a great extent in the pronoun, from these awkward and cumbrous swaddling-clothes of speech. This is happily the case with our own beautiful and practical language, and is an advantage for which we ought to be deeply thankful to our Norman ancestors, whose keen common sense led them to reject much that was useless and unwieldy in the speech of our English forefathers.

In this, it may be observed, there is an unfortunate confusion of sex and gender, which are not the same thing, however closely they may be allied. It is sex that is natural, while gender is grammatical and artificial. Those languages are the simplest in this respect which, like our own, recognize no distinction but that of sex. We have such nouns as "master" and "mistress," "executor" and "executrix"; we have also the pronouns "he," "she," and "it"; but these words denote the natural distinctions of sex or the absence of it, they do not represent the artificial distinction of gender. Mr. Beames so confuses sex and gender that we hardly know how to take him when he talks of languages "emancipating themselves, entirely in the noun, and to a great extent in the pronoun, from these awkward and cumbersome swaddling-clothes of speech." If he really means gender, and not sex, we entirely agree with him, and are quite content that relative pronouns should have no distinction of gender. If, however, he means that the distinction of sex may be dispensed with, and that, as in the languages with which he deals, one word may do duty for "he," "she," and "it," we strongly dissent from his judgment, and cling to the simplicity and perspicuity of our own personal pronouns. More than once Mr. Beames shows his partiality for "our Norman ancestors," and for the influence which he believes them to have exercised over our language. That influence was important, and in some respects beneficial, but it is absurd to talk of their "keen common sense" rejecting useless forms, as if they had deliberately considered the question, and come to a judgment as to what ought to be got rid of. The changes which took place in our language when it was moulded into its present form are attributable to no special influence either Norman or otherwise, but to that unfelt, unseen process of simplification which is always more or less actively at work, and was especially active when the speech of the Norman conquerors was broken down and merged in the tongue of their English subjects. But though we occasionally differ from Mr. Beames in his opinions and deductions, we do not undervalue his labours, or in any way depreciate the results of his industry and ability. The history of gender in the Aryan languages of India is curious:—"Sanskrit has all three genders, and so have the Prākrits. In the modern languages only Gujarāti and Marāthi have all three. Sindhi, Panjābi, and Hindi have only masculine and feminine; Bengāli and Oriya have no gender at all, except in the pure Sanskrit words now so largely introduced, which retain the form of the Sanskrit gender, but even this only in the higher style." Mr. Beames thinks that the use of gender has shown signs of becoming less habitual, and of gradually dying out. Gender exists in Hindi and Panjābi, but it is frequently disregarded, and it would probably have fallen into disuse but for the rise of a literature and the establishment of the printing-press. It is a linguistic refinement that can well be dispensed with, and we join in "setting our faces against the obnoxious pedantry of some modern Bengāli writers, who, in resuscitating a Sanskrit adjective, bring back with it the gender which the spoken language has long ago got rid of."

The modern languages have discarded the system of case-termination which obtained in Sanskrit, and have adopted the analytical method of employing detached particles. Hindi is prominent in this respect, Sindhi the most backward. Dr. Trumpp, the author of an excellent grammar of Sindhi, has claimed for that language a pre-eminence, "in a grammatical point of view," because "it has preserved an exuberance of grammatical forms for which its sisters may well envy it." This has stirred up the wrath of Mr. Beames, who exclaims against it as "false philology," and pours forth a torrent of eloquence about it. "As well," he says, "might the modern traveller, carried at the rate of thirty miles an hour in a comfortable railway carriage, envy the ancient German plunging through the muddy forest-roads in his vast and unwieldy bullock-waggon." This, and more in the same strain which follows, is all very right, but was scarcely called for, as the superiority claimed for Sindhi was restricted to its grammatical riches, and had no reference to its practical utility. Sindhi has kept closer to the Prākrits than any other of the modern languages, and so is richer in grammatical forms and has a higher value for purely technical purposes; but no one would dream of placing it in the first rank as a medium of intercourse.

We pass on to the declension of nouns, which, taken philologically, has more interest than any other part of the grammar of these languages. The noun presents the greatest divergences from Sanskrit and the Prākrits, and shows at the same time some puzzling analogies to the Dravidian languages of the South. On the strength of these resemblances some writers have claimed the languages of Northern India as members of the Dravidian branch of the Turanian family. This is an affiliation that can by no means be conceded, for except in this single matter of declension the Northern tongues are clearly of Aryan descent. Such other peculiarities as the languages of the North and South have in common may be passed over as fortuitous; but the method of declension must not be so lightly dismissed. A rule has been laid down in the science of comparative philology to the effect that, however freely words may be borrowed, grammatical forms are not adopted from an alien language. This is undoubtedly a reasonable maxim, and of very general application; but if ever there was reason to doubt its universality, these languages afford the opportunity. The Northern languages preserve none of the case-endings of Sanskrit, but the general principle of declension is this. The nouns have a nominative singular and plural, and an oblique form singular and plural; the oblique form being that to which the post-positions are added to distinguish the different cases. Now this is exactly the method of the Dravidian languages. The derivation of these oblique forms from the Prākrits is confessedly "the most intricate and difficult part of the inquiry." Mr. Beames, indeed, smooths over the difficulty by saying that "the mystery is not so much what they are, as how they came to assume their present shapes." This, it is obvious, begs the question. It assumes the relationship, though the family likeness is hardly traceable. A good deal of ingenuity is shown in the endeavour to trace the oblique forms to the Sanskrit case-endings; but the conclusion arrived at is, "that in both singular and plural the terminations of the oblique descend from a general form produced by the fusion of all the oblique cases of Sanskrit." A possible, though not a very convincing, result. But admitting the fact, under what influence did the modern languages develop these oblique forms, which are as foreign to Sanskrit as they are to Greek and Latin? Side by side with them, and even mixed up with some of them, were the Dravidian tongues, in which this mode of declension is an especial feature. The possibility of their having exercised an influence ought to be fairly examined, and not to be dismissed under the authority of an arbitrary rule, which, as we shall presently show, is admitted to have some exceptions. Again, the use of post-positions is another Dravidian feature which has to be taken into account, although the arguments founded upon it have been pushed too far. Some of these post-positions are traceable to Sanskrit sources, though with great difficulty and uncertainty. As an example, we will notice the dative particle *ko*, which is identical in sound with the Dravidian sign of the dative, *ko*, *ku*. The believers in Dravidian influences have held this to be an incontrovertible proof of identity. Mr. Beames is successful in showing that, although the words are now identical, they were not so much alike in ancient times. He adduces the old forms *kahan*, and *kahun*, in face of which it is impossible to claim for this particle a direct relationship with the Dravidian *ko*, which is known to have been spelt more than a thousand years ago just as it is at present. But, though successful in repudiating the Dravidian connexion, the author is not so convincing in the Sanskrit origin he assigns to this particle; and the difficulty is made manifest enough by the fact that he has changed the opinion expressed in his first volume. There he attributed it to the syllable *kam*, the accusative case of Sanskrit nouns in *ku*. We took occasion to express a doubt of this derivation. Dr. Trumpp, in his Sindhi Grammar, referred this particle to the Sanskrit *krite*, "for the sake of." Mr. Beames now throws over his first theory and Dr. Trumpp's proposition in favour of the Sanskrit *kakshe*, "at the side." All this shows the great difficulty of accounting for the origin of this particle, and we must confess that Mr. Beames's last theory is not a whit more satisfactory to us than the former one. The best that can be said about most of the speculations on the cases are that they are plausible, but not convincing; worthy of consideration as theories, but not admissible as demonstrations. We are as fully convinced as Mr. Beames can be of the descent of the Northern languages from Sanskrit, but their apparent similarities to the Dravidian tongues ought to be thoroughly examined. This work will not be complete without it, and we should be glad to see Mr. Beames handle the matter in a concluding chapter. The relations between the Aryan and Dravidian races in India have had their effects on both sides, and may have influenced language as well as other matters. Mr. Beames admits this, and says "there is great reason to suspect non-Aryan influence" both in the Bengāli and Oriya. The nature and extent of this influence is well worth investigation. That the modern languages of India are not proof against foreign grammatical influence is shown by the fact that "Sindhi allies itself to Persian and Pushtu by a practice foreign to its sister-tongues of suffixing pronominal signs to nouns, pronouns, and verbs, a complicated and difficult system from which the other languages are fortunately free." On the other hand, the Gond, a language of the Dravidian family, seems to have lost the relative participle which is peculiar to the Dravidian tongues, and has adopted from the Hindi a relative pronoun, a thing which is utterly unknown to its sisters. The last chapter, on the Pronoun, is short and comparatively clear, because these words are traceable with more distinctness and certainty to the Prakrit forms.

We have criticized some of Mr. Beames's views, but in a friendly spirit and with a just appreciation of the difficulty and the value of his labours. He has enjoyed unusual opportunities for the work he has undertaken, and neither industry nor critical acumen has been wanting to turn them to the best account. Upon one point we must again express our regret. The Nāgari character is used throughout, and but a very small portion of the Indian words has been Romanized. The book is therefore a sealed one to those who are unacquainted with the Nāgari alphabet, and will not render all the service it might to philological science.

MINOR NOTICES.

MR. DARWIN has prepared a second edition of his masterly work, *The Variations of Animals and Plants under Domestication**, in which he has embodied the results of his continued researches, and of communications from correspondents, during the seven years which have elapsed since its first appearance. Mr. Darwin adopts the excellent plan of giving a table of the principal additions and corrections which he has made, from which it will be seen that it is only on some minor points of detail, which do not disturb his general conclusions, that he has anything to retract or modify. The chapters on Pangenesis and Inheritance have been partially remodelled. It is unnecessary to repeat what has before been said of the high merits of this work as a model of clear, precise, and delicately adjusted scientific statement, in which a vast body of scattered facts seem to take ordered shape, as if by natural crystallization. There is no straining or twisting of argument, but only a quiet, steady accumulation of suggestive observations. If, when the work was first published, there were any doubts as to the soundness of any parts of the evidence, these must now be removed by the seven years' sifting to which it has been subjected.

Dr. Richardson, whose Utopian ideal of a town under perfect sanitary control was the chief attraction of the Social Science Congress at Brighton, has just published an important work on the diseases of modern life†, based upon a series of essays which he wrote some years ago, and which he has now developed into a more comprehensive and systematic treatise. This work is intended, not as a mere technical work, but for general reading; but the author gives warning that any one who expects to find in it "domestic medicine," or revelations of the arcanum of medicine, will be disappointed, and explains that, avoiding every infringement on the art proper of curing disease, he has confined himself solely to the science of prevention. This is undoubtedly an aspect of the subject which is too much neglected, and it is to be hoped that Dr. Richardson's weighty observations will receive attention. It may be thought that on some points he pushes his conclusions rather too far: but there is undoubtedly a sound body of truth in his earnest warnings. He lays great stress on the avoidance of strain and worry in connexion with mental work, on prudent reserve in physical exercise, and on the alternation of work and rest. He has no tolerance for stimulants of any kind; but recommends careful diet and scrupulous cleanliness, not merely in person and as regards the clothes worn next the skin, but in regard to all clothing, which, he holds, should be frequently changed, and never worn threadbare. Perfect isolation is his first principle in regard to contagious disease, and stricter care against the intermarriage of disease is also very strongly insisted upon.

Some time ago, Mr. Armstrong, who had already attracted attention by a poetical tragedy called *Ugone*, published the first instalment of a trilogy to which he gave the name of *The Tragedy of Israel*.† The first part was devoted to Saul, and now we have the other two parts, dealing respectively with David and Solomon. There can be no doubt that this is in various ways a production displaying genuine power and original thought. Mr. Armstrong's object appears to be to show that the Jewish kings were, after all, human beings like the rest of us. How far he has in each case caught the right key to the historical characters which he depicts is perhaps a question upon which much deep criticism might be expended; but it would, after all, be rather thrown away. The best way to appreciate Mr. Armstrong's work is to take it simply for what it is—a vivid dramatic poem, dealing with various problems of human passion, suffering, and trial. The language and often the ideas are entirely modern, but this only helps to bring out the essential humanity of the men before us, and the reality of their flesh and blood. Saul is represented, not as the champion of despotism and superstition, but rather as a disappointed reformer, somewhat in advance of his time. In David we have a touching picture of the inward struggles of a man of a warm, impulsive nature, who by his passionate faith in God and his feeling that he is in a mysterious and special way God's chosen instrument, is led to regard himself as raised above the ordinary level of his kind, and entitled to indulge himself in freedom from ordinary restraints as the reward of his peculiar mission. His thoughts soar "high as an eagle, to embrace the world," and he has visions of "one unfound ineffable splendour" which is to complete his life:

> Still the white peaks, and still the heaven beyond,
> And inaccessible and viewless realms,
> And heights without a name! and if I climb,
> What end? and where the quiet of the heart,
> Ambition's balm? where perfect empery,
> The slumber of old pride, the satiate soul?

In the midst of these lofty aspirations he finds himself struck down by a sense of his fleshly weakness and degradation. Then come Absalom's rebellion and death, and David himself then passes away dreaming of immortality. Solomon is shown carrying his ambitious wisdom and insatiable curiosity to the furthest limits, till, finding himself suddenly checked in a grand scheme of universal conquest, and his strength of mind and body also failing him, he gives himself up to despair:—

> Empty now
> My life as a drained goblet, and my days
> Raw as a drunkard's dawn.
> * * * * * *
> This life of man is utter weariness;
> The world a burthen, galling every hour;
> Mist, mist around, above; shadow and sun,
> Shadow and sun; faint forms that glint and fly;
> Sands shifting under foot; no staff or stay!
> My wisdom was mere folly!

And his last words are:—

> Out upon this grey life of nothingness!

Mr. Armstrong's style is not only vigorous but polished, and he has a certain largeness of utterance which gives elevation to his verse, without making it heavy. Altogether there is much freshness and power in these poems, though they may perhaps in some passages puzzle those who are accustomed only to conventional views of Scriptural persons and incidents.

The author of *The King's Sacrifice** is rather a prosy poet. In his preface he anticipates the objection that he may be thought to be somewhat obscure, but he explains that this is unavoidable in treating of "themes which no one has ever yet succeeded in making easy reading." As regards the first piece, which gives the title to his volume, this excuse may perhaps be allowed. It tells the story of Nezahualcoyoth, King of Tezcuco, who was not only "the poet, legislator, astronomer, and first warrior of his age," but "yet more, the prophet and religious reformer," and who set himself to regenerate his country by suppressing human sacrifices, and supplanting polytheism by the worship of Ipalnemoäni—"Him by whom we live; the Unknown; the Creator of all Things." He finds, however, that the time is not ripe for these advances in civilization, and, maddened by the murder of his son, he gives himself up to the priests, and allows them to "slay and feast" as much as they like. It may be thought a proof of courage and self-confidence that a poet should burden himself in his efforts to be melodious with such words as Popocatepeth, Quelzalcöeth, Tenochtitlan, Mizcoäzin, Pilmanazin, and the idea and machinery of the story are all of a mysterious kind. The subject is not inviting, and we cannot wonder that the writer should fail to make it "easy reading." In "Oakburn," a sketch of modern society, however, he has a better chance. This is evidently written in imitation of Tennyson, and is a striking example of the distinction between real poetry and a mere stringing of words. Here is a sample:—

> In a haze of glimmering lawn
> And titter of girl-Tattons Mabel swam
> Till Tea should be proclaim'd; and while the tall,
> Scant-headed Dr. Firloe in the air
> Portray'd the sun's penumbra, pencil'd up
> The conformation of his photosphere
> Like willow-leaves, Miss Bibbledale, as who
> Should say, "How sweet, how interesting now!"
> A meek smile sent to meek responsive Cheek,
> Perpetual curate of Dydelle-cum-Dish.

Or, again:—

> The question rising if seed were to spoil
> Hot cakes with waiting, Mrs. Tatton thought
> Decision lay with Mabel: promptly Cheek
> Was handing Mabel muffin. As he did it,
> Shyly with Mowbray stept the stranger in—
> Tall, slender, with fine eyes.

And then we have the heroic climax:—

> And Roland sat with Mabel through the Tea!

In the serious pieces this prosy wordiness is perhaps less offensive; but the writer of these four hundred pages of dull, lumbering verse has certainly mistaken his vocation.

Mrs. Pfeiffer † has undoubtedly the true spirit of a singer, though her execution is apt to be crude and wayward, and what she has to say is very unequal. She is certainly not successful in her ballads, and we are led to suspect that the apparent ease of this form of verse tempts her into a careless haste. In the sonnets she is at her best, and this may possibly be due to the restraint which is imposed by the necessity for careful choice and economy of words in this style of composition.

"Violet Fane," ‡ the author of *Denzil Place*, has composed another volume of weak and watery verse—if verse it can be called, for, except that it is printed in the form of verse, it is only ordinary prose. There is so far an improvement in her present work that there is no repetition of the improprieties which tainted the earlier one.

Mr. Williams has produced a voluminous history of the Midland Railway§, which, though perhaps rather overloaded with gazetteer matter, gives a very interesting and lively picture of railway enterprise. We are shown the successive developments of an ambitious and enterprising Company, always on the alert; now dashing into a neighbouring territory, now meeting an invasion on its own; if baffled in one direction, immediately seeking an outlet somewhere else, and all the while steadily spreading its long feelers over the country like a vigorous octopus. It is quite thrilling to follow the almost incessant warfare between the Midland and other railways; the desperate conflicts for traffic now at

§ *The Midland Railway.* By F. S. Williams. Strahan & Co.

one point, now at another; a fierce war closed perhaps by a sudden alliance with the enemy, and then another war breaking out in a new place. Whatever may be thought of the policy of the Midland Company on various points, there can at least be no doubt as to its energy and wonderful growth. Mr. Williams's book is illustrated by some excellent illustrations of local scenery, and contains a good deal of amusing gossip. There are various points, however, on which more specific information might have been given.

Mr. Carew Hazlitt's edition of Dodsley's *Old English Plays* * is now completed by the issue of the fourteenth and fifteenth volumes. We have already expressed our opinion of the earlier volumes of this work (see *Saturday Review*, April 3, 1875), and need only repeat that, although Mr. Hazlitt is not quite such a careful and accurate editor as might be desired, he and his publishers have by this useful reproduction rendered an important service to all who are interested in the history of dramatic literature. At the same time we cannot help thinking that some of the pieces which have been reprinted, especially those in the last two volumes, might with advantage have been left in obscurity, as being mere stupid obscenity, without either literary or historical interest.

A new edition of Dr. Dyer's *Pompeii* †, revised and enlarged by himself, has just appeared, bringing the information down to the latest date. The value of Dr. Dyer's scholarly work has already been recognized, and, in its present form, it is the most complete and convenient record of the ancient city. It should be mentioned that it is illustrated with numerous wood engravings and an excellent map.

Sir Robert Phillimore has reprinted a number of his judgments in the Court of Arches ‡ as a memorial of that obsolete tribunal, and it is no doubt a very appropriate one. The latest judgments of this Court—those in the tombstone case and in Jenkins *v.* Cook—were not perhaps very happy, and they have since been summarily reversed by the Privy Council. On the whole, Sir Robert's judgments are more remarkable for their rhetorical flow than for clearness of perception.

By the substitution of woodcuts for coloured lithographs, and the omission of some references which are easily accessible in other forms, the publishers of Dr. Donaldson's well-known *Theatre of the Greeks* § have been enabled to issue a compact edition of that valuable work at a low price, which will no doubt be welcomed as a boon by students. Tate's essay on the Metres is retained in this edition.

It is amazing what empty and absurd publications are nowadays put forth as school-books. For the study of the language, Messrs. Cassal and Karcher's *Anthology of Modern French Poetry* ‖ may possibly be of some use, though we should think that prose, in which the French excel, would have been more profitable as an exercise. Except in its highest forms, French poetry is poor stuff, and it seems rather hard that English schoolboys should have to wade through the mass of weak verbiage which is here collected under the name of poetry. The editors display a singular fatuity in asserting that "the (French) poets of our days yield to those of no other country either in purity of thought or taste, or in vivid imagination, or in graphic power of expression." In point of fact, there is nothing so worthless as modern French poetry, if we leave out one or two eminent exceptions to the average mediocrity. There are hardly more than three or four of the writers quoted in the present collection who have ever been heard of before, and the samples of their verse do not encourage any desire for further acquaintance. Here is a specimen:—

C'est la petite mendiante
Qui vous demande un peu de pain;
Donnez à la pauvre innocente;
Donnez, donnez, car elle a faim.
* * * *
Si ma plainte vous importune,
Eh bien! je vais rire et chanter.
De l'aspect de mon infortune
Je ne dois pas vous attrister.

The Three Trials of William Hone ¶, which have been reprinted in their original form by Mr. Tegg, are interesting as an illustration of the temper both of the Government and of the Judges of that day in regard to popular literature, but are otherwise not of much value. The parodies on the Liturgy for which Hone was prosecuted are equally silly and profane, but it is evident that he was chosen for attack not so much on account of the profanity of his writings as because they were directed against certain public men. He was able to show that similar breaches of good taste on the part of others had been overlooked, and public feeling was against the apparent overstraining of the law. It is difficult, however, to have much sympathy with Hone, who could easily have expressed his views in a less indecorous manner. His speeches at the different trials bring out very strongly his pluck and shrewdness, as well as his acquaintance with books.

"Stonehenge" is a name of such established authority on all sporting matters that it is unnecessary to say more of his book on British rural sports * than that it has reached a twelfth edition, in which all the latest varieties of athletic and other amusements are fully explained. Since the first appearance of this work, croquet, lawn tennis, canoeing, bicycling, and roller-skating have come into fashion, and when "Stonehenge" next revises his manual, some of these will probably have been supplanted by new devices. He thinks that rinking has now taken a permanent place among English sports, as it requires skill, and affords "the hard-worked professional man an hour's physical exercise at any hour of the day most convenient to him, and in a form that affords him the purest delight." The first roller-skate seems to have been invented in 1823 by one Tyers, a fruiterer in Piccadilly, and other patents of a similar kind followed at intervals, but none of these skates were guidable in curves, except at the expense of enormous friction. It was not till 1865, when J. L. Plimpton of New York brought out his now famous skate, that curves and all other figures known on ice were brought within the reach of skaters on an artificial floor, and some years elapsed before it was taken up by the public in this country, though it was occasionally used by professionals on the stage. Bicycling is another economical amusement. A good roadster with a driving wheel fifty inches high can be got for 13*l.*; it costs no more for repairs, if fairly used, than a horse's shoes; it involves no expense on a journey save a small allowance for oiling and cleaning; and an indifferent rider can average nine or ten miles an hour without feeling distressed at the end of a day of ordinary length. Stanton has done 650 miles 1,176 yards in 47 hours 10 minutes, net time, or an average of rather more than 13¾ miles an hour. "Stonehenge" has an interesting chapter on the "choke-bore" gun.

Baedeker's Guide to Palestine and Syria † is the joint work of Dr. Socin, Professor of Oriental Languages at Basle, who is well acquainted with the Holy Land, and the publisher himself, who made a tour for the purpose of making the information as complete and exact as possible. A great deal of matter has been compressed into a moderate space, and the directions as to the details of travelling appear to be very judicious and complete. There are also a number of good maps, and generally this guide-book fulfils all those qualities of practical usefulness which have made the reputation of the series to which it belongs.

Mr. Paget ‡ has drawn up an interesting statement of the strength of British and foreign ironclad navies, giving dimensions, armour, details of armament, engines, speed, and other particulars. Ships, he justly contends, must now be measured by their individual power, and not by mere numbers. The *Inflexible*, for instance, if her speed is sufficient, will, with her 24 inches of armour and her 81-ton guns, be fully able to hold her own against the combined attack of a fleet, because she will engage at a range at which her own armour will be invulnerable, while her tremendous guns will pierce anything opposed to it. On the other hand, if we keep up mixed squadrons with guns of from 6½ to 35 tons, they will have to engage at a range at which the heavier guns will have no advantage. Mr. Paget thinks that the design of the *Monarch* has never been properly developed, and that partial armour-plating is enough.

Mr. Rogers has gone into the history of George Wishart, the Scottish martyr §, with a view to test the truth of the charges that he was a visionary who illegally assumed the priestly office, denied the doctrine of the atonement, and conspired against the life of Cardinal Beaton; and he has arrived at the conclusion that Wishart did not claim prophetic powers, preached with canonical sanction, did not act as an ordained priest, always taught the doctrine of the atonement, and not only did not know of the plot against Beaton, but, if he knew it, condemned it. The last of these propositions strikes one as rather equivocal, and almost proving too much. We have to thank Mr. Rogers, however, for an interesting monograph.

Mr. Reed has republished in a volume the letters from Russia ‖ which he contributed to the *Times*. He adheres, in the main, to the views therein expressed.

With a view to make known the present condition of Jerusalem, and the need of help for the Jewish population there, Sir Moses Montefiore has published a record of his journey last year ¶, which will be read with the respect due to his courage and enthusiasm.

Mr. Dunning Macleod has put forth a synopsis of his views on credit, banking, and the foreign exchanges, in a handy manual, under the title of *Elements of Banking*. **

The extraordinary miscarriage of Lord St. Leonards's will †† should be a warning to every man, lawyer or layman, against being foolish enough to fancy that he can dispense with the usual professional assistance in carrying out his testamentary wishes. But there are,

no doubt, points on which intending testators are anxious to be informed, and Mr. Phippen's "Practical Advice" is plain and to the point.

Mr. Archer's account of various forms of charitable work* contains a good deal of interesting information, but is disfigured by a rather twaddling style, and a canting affectation which substitutes Scriptural phrases for the ordinary names of the various institutions which are passed under review. Thus, for instance, we have "With them that go down to the sea in ships," "With the children of the stranger," "With them that faint by the way," "In the Valley of the Shadow of Death," "With them who have not where to lay their heads," "Feeding the Multitude," and so on, instead of such simple titles as Sailors' Homes, "Providence" Hospital, Invalid Asylum for Respectable Females, Royal Hospital for Incurables, Night Refuges, Soup-Kitchens. Still the book is worth looking at.

Miss Hope's Life of Grace Darling† is in one way a work of a very unsatisfactory character. We do not know how far it is fiction and how far matter-of-fact biography. We are treated to long conversations between different persons the report of which must be to a great extent imaginary; that is to say, the conversations may have actually occurred, but, unless there was a short-hand writer present to take down what was said, it is difficult to see how it can now be literally reproduced. The truth is that Grace Darling's life, with the exception of the heroic adventure by which she made herself famous, was, like her character, extremely simple, and might be all told in a comparatively brief space. But then Miss Hope had determined to make a book, and a book she has made. At the very beginning there is a great lump of padding about Mrs. Fry and women's work in general, then we have an account of ancient Northumbria, with quotations from Dean Stanley, and so on. The volume is further expanded by chapters about lighthouses and perils of the sea. The chapter called "August Picnics" may be taken as an example of Miss Hope's style of passing off twaddling fiction as biography.

Mr. Vincent has compiled a useful record of scientific and mechanical progress during the past year.‡ A great many valuable facts are constantly turning up in scientific newspapers and journals, but are afterwards apt to be lost on account of the scattered way in which they are published. Mr. Vincent's *Year-Book* is a sort of sieve in which the most important fragments of this information are collected.

Mr. Martin's *Statesman's Year Book*§ keeps up its reputation for conciseness and sufficiency. No one can understand foreign questions without such a work at hand for constant reference. Many unfortunate Turkish bondholders and the victims of other unscrupulous States might have saved their money if they had previously invested in Mr. Martin's modest manual, and studied the amount of debts already contracted. The armaments of various States are also an instructive clue to their foreign policy. There is nothing more useful for Englishmen, just now, or indeed at all times, than to understand exactly how their neighbours are situated.

Mr. Tufnell's slapdash and prejudiced attack on the system of boarding-out children‖ as practised in Scotland, and to some extent in England, has naturally given great offence. Mr. Skelton, the Secretary of the Poor Law Board in Scotland, feels bound to treat Mr. Tufnell to what in that country is called a "good heckling," and certainly does not mince matters. He feels bound to say that in Mr. Tufnell's "indictment directed against the Poor Law authorities in Scotland, the strict and absolute adherence to facts which should characterize official documents has not been observed." The facts which Mr. Skelton sets forth would seem to justify his assertion that the boarding-out system gives very good results in Scotland.

At first sight the title of Miss Yonge's book seems to suggest that it is rather out of date. *Christmas Mummers*¶, however, is only one of seven stories, and they are all good stories, in Miss Yonge's well-known style, and fit for any time of year.

Nothing is more exhilarating than a sojourn in the Highlands in good weather, with agreeable friends and plenty of sport, and it is natural to find a record of such experiences brimming over with frolicsome good nature and animal spirits. What, however, sportsmen who take to literature are in some danger of forgetting is that it is difficult to reproduce the atmosphere of their own exhilaration for the benefit of readers at a distance. A joke may be an excellent joke in a particular company at a particular moment, but it is wonderful how it evaporates when bottled for exportation. This remark applies to Mr. Abbott's *Ardenmohr***, "a record of scenery and sports in the Highlands of Scotland." It is satisfactory to see that Mr. Abbott enjoyed himself so heartily; but, after all, the telling of it is apt to flag. It is written in that cheerful, slangy, simple-minded style which is so much appreciated in sporting circles, where healthy physical exercise and a good appetite allay any troublesome craving for intellectual excitement. There are, however, some touches of "pawky" humour both in the etchings and the letterpress.

The object of Mr. George Clifford's Life Assurance Handbook* is to "restore public confidence in Life Assurance Offices." The writer describes the working of a number of offices as an illustration of the conditions under which, he thinks, absolute safety can be secured. We should be disposed to doubt, however, whether pushing and puffing are so essential to the success of a well-established office as he seems to imagine; and it is obvious that this must involve a heavy expenditure of a somewhat doubtful kind.

Mr. Bartley, who has made a special study of the Poor Law system†, and is already known by several works on the subject, has compiled a manual of the duties of Guardians, with practical examples of the treatment of typical cases. It must tend very much to simplify a Guardian's labours to have such a clear and practical guide at hand, and Mr. Bartley, besides distinctly explaining the duties, gives some sensible advice.

Mr. Rooper once spent some time in a wild corner of County Mayo, where he had some good shooting; and he has thrown some personal reminiscences of his residence there into the form of a story.‡ In these days there has been rather a surfeit of pictures of Irish life, and, though Mr. Rooper's are not without interest, they are rather too much like what one has read before about the "potheen," the pretty girls, the big salmon, and all the rest of it.

The object of *First Steps in Geography*§ is to prepare young pupils for the study of geography by giving them an interest in the accurate observation of surrounding objects, and making them understand the elementary notions and technical phrases which will afterwards have to be applied. A sound foundation is thus laid for future instruction. The work is intended for the assistance of teachers, and is adapted to the most recent revision of the New Code.

The Oxford University Press has issued what is said to be "the smallest Prayer-Book in the world."‖ It is three and a half inches in length, and weighs barely an ounce. Only a very foolish person would ever think of ruining his eyesight by reading such exceedingly minute type, especially as it is made still more indistinct by the extreme thinness of the paper. The only excuse for such a work is that it is a typographical curiosity.

Debrett's annual issues¶ are of the usual character; but the volume which deals with the House of Commons acquires a particular value from being enriched by Dr. Keneely's coat of arms, which is a magnificent combination of quarterings from the blazonings of England and ancient France *plus* those of some apocryphal Irish chieftain. We do not know whether it is guaranteed by the Heralds' College; but, as far as lions and all that sort of thing go, it is a wonderful piece of art.

For some years Dr. Dobell has been editing Reports on the progress of practical and scientific medicine**, but the extent of the subject has been found somewhat embarrassing, and he has now resolved to confine the annual Reports to a specific department, that of chest disease. The first annual volume has just appeared, and appears to be a very complete and valuable work of reference.

Major Clifford, Professor of Military Law at the Staff College, has composed a classified *précis* of the Mutiny Act and Articles of War†† for the use of military students, which presents in a brief form all the necessary information on the subject.

The *Musical Tales and Sketches* translated from the German of Elise Polko‡‡ are of rather a sentimental and vapoury cast, and the mixture of biography and fiction is very confusing.

POLITICS, LITERATURE, SCIENCE, AND ART.

No. 1,064, Vol. 41. March 18, 1876. [Registered for Transmission abroad.] Price 6d.

THE ROYAL TITLE.

THE dislike generally entertained to the QUEEN being called Empress is so strong that the CHANCELLOR of the EXCHEQUER spoke of it on Thursday as a panic. This may be a good or a bad term to use in speaking of this particular outburst of public feeling, but it at least closes the discussion as to whether the feeling is general and strong. The grounds of a panic may be mistaken, but it would be absurd to speak of a panic on the Stock Exchange without meaning that there was a general alarm among speculators. There being this strong feeling, how was expression to be given to it in the House of Commons? Unfortunately, when the strong feeling is against a Ministerial proposal, there is often no practical means of giving vent to it, except by the leader of the Opposition becoming the organ of its expression. Immediately a totally new question is raised, and the supporters of the Ministry say that, if the matter is to be treated as one involving a triumph or defeat of their party, they will sink every other thought in the determination to crush the Opposition. It became a trial of strength between Mr. DISRAELI and Lord HARTINGTON, and Mr. DISRAELI, having a large majority willing to follow him, used it, and Lord HARTINGTON was crushed. But it would not be accurate to say that the majority was composed altogether of members who voted merely to support the Ministry. There were several motives which combined to actuate the majority. There was the feeling that, having gone so far as to pass the second reading, the House was not justified in refusing altogether the title of Empress; the feeling that if the Bill was a favour to India, a favour having been offered should not be withheld; the feeling that we must not shrink from proclaiming our intention to retain supreme command over India; and, above all, the hope that somehow the title of Empress might be happily confined to India, and that we in England should never be troubled with anything to remind us that the QUEEN was anything but Queen. Whatever turn the debate had taken, it is probable that the vote would have been the same, but in point of fact the debate was very useful. The Ministry have at last, after many wandering guesses, arrived at a tolerably clear view of what they think the title of Empress of India means, why they think it should be assumed, and why the evil consequences generally apprehended are not likely to flow from it. The meaning of the title is said to be that the QUEEN is paramount sovereign in India; the reason for the title being assumed is that it is convenient that this supremacy, which is a fact, should be publicly proclaimed in order that the princes of India may know, and that all others concerned may know, their true position, and that every native of India, from the highest to the lowest, may clearly understand that, having got dominion over them, England intends to keep it. And the reason why no evils are likely to be felt in England are that the reasons for calling the QUEEN Empress can only apply to India, and are such as necessarily to localize the title. The intention to retain by the sword supreme dominion obtained by the sword cannot, it is argued with some force, be a thing which any one can consider it desirable to announce with regard to England itself or to the Colonies. The QUEEN is not taking a new title in order to describe more accurately whom she rules and where she rules, but to inform one particular portion of her subjects that she rules them in a particular way, and that this is the way in which she purposes that they shall [illegible] for an incalculable length of time.

Two questions accordingly have to be answered. Is the title Empress a correct title if confined exclusively to India? and is it expedient that, if accurate, it should be assumed? We must own that it does seem an accurate title. Emperor is an apt expression for a sovereign who is sovereign of other sovereigns. There was much discussion in the House as to the relation of the Indian chiefs to the English Crown, and it was pointed out that many of the chiefs, if not all, have accepted the position they hold under treaties with us. But there is nothing inconsistent in saying that a sovereign may by contract undertake to recognize another sovereign as his paramount lord; and, whether by custom, or by express stipulation, or by our interpretation of stipulations in which the chiefs have been forced to acquiesce, the relation of the chiefs to the English Crown has come to be exactly that of dependent sovereigns to a supreme sovereign. The nature of this dependency is very real and complete. As Mr. GRANT DUFF truly said, there is not a single Indian prince who would think of denying that the QUEEN is paramount in India. The native States are obliged to act with the Viceroy in all matters considered by him to affect India generally; none of these States are allowed to make treaties, either with foreign Powers or each other. All have to submit to our interference so far as we think proper to exercise it; and the recent instance of Baroda may remind us how very summarily the right of interference is occasionally exercised. That it is now expedient that a title should be assumed distinctly proclaiming this sovereignty, is asserted on the following grounds. It is convenient that the claim of paramount sovereignty should be made, in order that the native princes may once for all understand their position, and that when we exercise our paramount rights we should not seem to be doing something extraordinary and occasional, but something natural, regular, and necessary. When, for example, we depose a Gaikwar, or require several medical certificates to excuse the non-attendance of the infant NIZAM to pay homage to the PRINCE OF WALES, it is convenient that we should be understood not to be momentarily capricious or exacting, but to be merely carrying out a settled and accepted policy. In the next place, our dominion in India is so strange and new that speculative natives might be tempted to ask whether we ourselves really and in the bottom of our hearts think it can last. This is a doubt or suspicion from which it is thought very desirable that the native mind should be relieved, and we therefore now proclaim in a significant way that, having forced our way into India, we mean to stay there. England wishes to let all the world know that she adopts with regard to India the words of Marshal MACMAHON—"J'y suis, et j'y reste." Lastly, it is said that this significant proclamation of ours will be most acceptable to the natives generally. It is difficult of course to prove this. Lord SALISBURY said on Tuesday that the natives are politically dumb. Sir STAFFORD NORTHCOTE defined their position with more delicacy of distinction. They are not exactly dumb, nor do they exactly speak; but the word Empress is "trembling on their lips," and our apprehension or interpretation of the nascent sound may be helped by our general knowledge of the propensities of the native mind. The natives like to think that there is some one over every one else. They love to live under a strong enduring Government. If they use a title, they like it to be a good big rolling title, a title that fills their mouths when they have got over their difficulties of articulation. If they bow, they like to bow to the ground. We may choose to consider these propensities somewhat servile. It is simpler, the Government reply, to call them merely Oriental, and to recognize them. It is a most happy coincidence that we can afford the natives a peculiarly Oriental description of pleasure at the same

he incumbent on him, of bringing English opinion and English feeling to bear on Indian affairs, and the further duty which Lord CARNARVON thinks rests with every Governor of a Crown colony of making the local Government feel through the telegraph and by the issue of positive instructions that it is dependent on the Home Government, and must not usurp independence. No doubt the despatch was a severe rebuke to Lord NORTHBROOK; but then it is, as Lord SALISBURY said, his business to rebuke a Viceroy when the Viceroy does wrong.

A very different theory of the relations of the Viceroy to o Secretary of State was laid down by Lord LAWRENCE. In his opinion the Viceroy is not at all like of an ordinary Crown colony. The circumst he is placed are totally different. He has to symbonize authority in the presence of a vast multitude of Orientals who are only kept down by the awe of authority. He has to think what is best for India, to take the steps which India requires, to propose the legislation which India needs. He reports his doings to the Secretary of State, who, if he pleases, can recall him or veto his measures. As far as convenience may admit, it is no doubt desirable that, before measures are proposed by the Viceroy, he should submit them to the Secretary of State, as the Secretary of State may make some useful suggestions with his superior knowledge of English opinion and English feeling. It is for the Viceroy to determine what is the value of these suggestions. It is useful for him also to know beforehand what measures the Secretary is likely to veto, as [illegible] a waste of time; but if he thinks India local; and the [illegible] which he knows the Secretary will this may save him [illegible] it and let the Secretary veto requires a measure [illegible] ing that, so [illegible] he can, and will have a veto, it is his business to pass [illegible] their [illegible] of State rebukes him, it. He will have done all for In [illegible] greatest safeguard must clear conscience. If the Secretar [illegible] and high feeling of the Viceroy, if not thin-skinned, will not much mind; and indeed it is not likely he should be much hurt, as he is the man who knows India being rebuked by the man who does not know. Supposing peremptory instructions were sent him as to future legislation of which he disapproved, as Lord LAWRENCE disapproves of the repeal of the cotton goods duty, then Lord LAWRENCE said he should simply disobey them. This, and this only, is the way in which, as the only peer who could address them with the actual experience of Viceroyalty informed the Lords, India can be governed.

It is obvious that these two theories entirely conflict: and it is perhaps also obvious that, while Lord SALISBURY's theory can be carried out in the hands of a Secretary of State with anything like his energy and determination, it is scarcely possible that Lord LAWRENCE's theory can be carried out except under circumstances that may happen once in a century. It is natural that Lord LAWRENCE should assume that the VICEROY knows what is wise for India, because he really did know India as far as any one human being is capable of knowing it. But what can Lord LYTTON know about India? Absolutely nothing. The Secretary of State must, and while Lord SALISBURY is in office most certainly will, direct him. On the other hand, it is hard to persuade ourselves that India is really like any ordinary Crown colony, and that the Viceroy is only a gentlemanly servant at the other end of a wire with a handsomer livery than usual. The end of all reflection on the debate in the Lords is that there is something true in both theories, and that all that can be done is, by tact and patience and wise allowance for differences of view, to combine them as far as possible. It is, no doubt, very hard to do this, and Lord SALISBURY easily showed that other Secretaries, and especially the Duke of ARGYLL, had used language to other Viceroys more outspoken and peremptory than anything he had written to Lord NORTHBROOK. But mistakes are mistakes, even if other people have committed them. It is not assuming much to assume that, if Lord SALISBURY had now to write his views about the repeal of the cotton duty, he would use more moderate language. He would guard himself more closely against the appearance of dictation. Perhaps the debate will have a general and useful effect, and will incline not only the present but future Secretaries, to uphold the Viceroy as much as possible to rebuke him as little as possible, to be very cautious in bringing views of English opinion and English ideas to bear on India, and to avoid casting out all sense of responsibility in the Indian Government by the abuse of the telegraph.

THE FRENCH MINISTERIAL STATEMENT.

A MINISTERIAL statement which begins by asserting the legitimacy of the existing order of things in France may be thought to be either superfluous or useless. If the deliberate consent of a constituent Assembly and the popular ratification which is implied in the return of a large Republican majority are not at once recognized as sufficient to give the requisite validity to the Republic, of what avail will it be that the new Cabinet has added its seal? If we pass beyond the form, and ask whether the new institutions have any promise of permanence beyond those which have preceded them, the answer must be left to the future. Either way, it may be contended, the first paragraph of the statement which M. DUFAURE read on Tuesday in the Senate, and the Duke DECAZES in the Chamber of Deputies is altogether out of place. The answer is, that messages of this kind are not intended either for foreigners or for political students. They are addressed to the parties which compose the Legislature at that particular time, and, judged by this standard, [illegible] statement will not appear inappropriate. Its opening words define with great accuracy the position which its authors intend to assume with reference to the Legitimists, the Bonapartists, and the extreme Republicans. The assertion that, in human society, power cannot have a higher origin than the deliberate assent [illegible] those over whom it is exercised is addressed to the Legitimists. It separates the new Cabinet from men like M. BUFFET and the Duke of BROGLIE, who, though they were willing to accept the Republic as the best attainable substitute for a legitimate Government, still looked forward to a time when it might be replaced by a Government to which that character should attach by right and not by sufferance. M. DUFAURE declares in effect that, though a Monarchy may conceivably be substituted for the Republic, as being likely to answer [illegible] Government better under certain circumstances, the advantages [illegible] determination to [illegible] the change would be practically [illegible] nourishes are not to be literally [illegible] have another the ends of [illegible] population must come to an [illegible] for the more rational leaders can cal, not theoretical. These same [illegible] their Mussulmeaning as regards the Bonapartists. They claim [illegible] ations Republic all the popular authority which on the Imperialist theory can only be given by a plebiscite. Universal suffrage, the statement seems to say, is not essentially associated with a particular mode of taking the votes. A Government can be as effectually recognized by a Legislature the members of which have been chosen by constituencies fully aware of the issue submitted to them, as if the inquiry had taken the shape of Will you have the Republic or the Empire? To the extreme Radicals this first paragraph conveys a reminder that any defects that may have existed in the constituent powers of the late Assembly have been fully condoned by the vote of the electors. If the new MINISTER of the INTERIOR stands by the assurance which follows, and insists upon his subordinates showing their fidelity to the Government by "making the Republic understood and appreciated," the distinction between the present and the late Cabinet will soon be thoroughly understood. M. BUFFET neither understood nor appreciated the Republic himself, and his subordinates were fully sensible that any signs of doing so on their part would be the worst possible passport to their chief's favour. There is no reason to suppose that, if M. RICARD makes his wishes equally clear, he will have any difficulty in securing an equally prompt obedience. When M. BUFFET retained the Bonapartist prefects who had been appointed by the Duke of BROGLIE, there is little doubt that he might have turned them into fairly good Republicans if he had only been willing to take the pains. As it was, he preferred to keep them Bonapartists; and, when they found that no change was demanded of them, it was natural enough that they should continue to bear their own characters. But the reasons which would have made it their interest to become Republicans at M. BUFFET's bidding have lost none of their force, and will probably be found equally effectual to make them become Republicans at M. RICARD's bidding. It may be a little hard at first to have to proclaim that the Republic, more than any other form of government, needs to rest upon religion, property, and respect for labour, considering how lately they have been engaged in proclaiming that religion, property, and respect for labour are necessarily incompatible with a Republic. But they will not be long in mastering their new lesson, and any anxiety they may feel as to their power of doing so will be soothed by the reflection that the elections have shown how very little it matters whether they master it or not.

The only legacies from the late Assembly which the new Cabinet seems prepared to accept are the controversy about University degrees and the controversy about the nomination of mayors. It is a decided concession to the Left that these questions should thus be singled out for immediate legislation. The compromise arrived at by the Assembly during the passage of the University Education Bill has hardly begun to take effect, and it is certainly early to interfere with it. But the prompt activity with which the bishops have availed themselves of their new powers as regards the foundation of Universities has given a flavour of clericalism to a law which in itself was neither unjust nor injurious to the interests of education, and it is almost impossible for a Cabinet which leans in any degree on the Left to avoid professing its readiness to review the question. Under the present law the examiners for degrees are appointed by a Board in which the University of France and the free Universities are alike represented, and the least concession demanded by the Left is the excision of the latter element from the Board. It will appear to many that the narrowness of spirit which will hesitate to allow due merit to the candidates sent up from a rival University may be as powerful in the University of France as in the free Universities. Even if the security afforded by common representation on the examining Board is found inexpedient, some equally unpopular equivalent will probably have to be substituted for it unless the legislation of last year is to be altogether overthrown—a result which is scarcely to be expected when four members of the Cabinet were also members of the Cabinet which passed the Universities Bill. The nomination of mayors is a matter which has been made to seem more important than it really is by reason of the exaggerated expectations which the Duke of BROGLIE, and even M. BUFFET, entertained of the working of the present law. They always assumed that it would be impossible to manage the elections unless the Government nominated the mayors. When the elections came it turned out that, even though they had the nomination of the mayors, they were wholly unable to manage the elections, at least in any sense which affected the composition of the Chambers. The relations between the Government and the mayors are such that it may often be highly inconvenient to have the post occupied by an adversary, not merely of the particular Cabinet, but even of the form of government which it is the business of the Cabinet to administer. The Republican party are likely to feel this inconvenience quite as keenly as any of their opponents, and it may be suspected that in their hearts they are not very anxious to deprive themselves of an advantage of which they failed to deprive either M. BUFFET or the Duke of BROGLIE. But the necessity of appearing consistent compels the Left to insist on some modification of the law, and leaves the Cabinet no choice but to promise to give the subject its best consideration.

Some surprise and more regret has been expressed at M. GAMBETTA'S attitude towards the new Ministry. It seems to be forgotten that, though a politician may not resent in act the exclusion of himself and his followers from the offices to which their weight in the Legislature appears to entitle them, it is scarcely to be expected that he should not resent it in words. M. GAMBETTA probably knows as well as any man that in the present condition of France a Cabinet formed on strict Parliamentary principles is out of the question. The Executive is more Conservative than the Legislature; and the Executive, as well as the Legislature, has to be consulted in carrying on the government. But, inasmuch as the existing Cabinet is professedly formed on Parliamentary principles, it is not unreasonable that the leader of what is accepted, at all events until some decisive decision shall have proved the contrary, as the strongest section of the Republican party in the Chamber of Deputies should call attention to so direct a violation of them. And supposing, as there is good reason to suppose, that the Cabinet is genuinely Republican, it is to be desired that M. GAMBETTA should take up an attitude of criticism rather than of simple support. A time must arrive when the term Republican will cease to be a party distinction, and will become a common title, including not only the Ministerialists, but also the bulk of the Opposition. When that time arrives, M. GAMBETTA will be the natural leader of the Liberal Republicans, as M. DUFAURE, or his successors, will be the natural leader of the Conservative Republicans. Probably the immediate result of this change will be to lessen the number of M. GAMBETTA'S followers. Of late the Republican party has been almost identified with him, inasmuch as the nominally Republican Administration was suspected of cherishing a secret affection for other forms of government. Now that this is no longer the case, the differences that exist in the Republican party will become more evident, because they will no longer be suppressed in the presence of common adversaries. Timid politicians may think the change a symptom of weakness; but it will in truth be the best evidence, because the necessary accompaniment, of Republican progress.

THE AMERICAN PRESIDENCY.

BETWEEN the Philadelphia Exhibition and the Presidential election the people of the United States are provided with interesting occupation for some months to come. The Centennial celebration is the occasion of graver excitement, and its practical results may perhaps be more important. Up to the present time the promoters and managers of the undertaking have displayed remarkable energy and ability, and the Exhibition will probably be one of the most brilliant of the series, as it will be larger in all its dimensions than the displays of London, of Paris, or of Vienna. The equanimity of summer visitors, whether they are Republican or Democratic, will be but slightly disturbed by the victory or defeat which they may respectively hope or fear to experience in November. In former times the choice of a President involved both considerations of personal fitness, and on some occasions weighty political issues. The last contest of political significance ended in the election of Mr. LINCOLN by a minority, in consequence of a schism in the ranks of his Democratic opponents. The candidate himself was almost unknown; but as soon as he was elected, the most pugnacious of the Southern States seceded from the Union. His re-election in 1864 was a fitting recognition of his public services, and the only successor who has since owed his elevation to a popular vote also received his first appointment as a merited reward. The recollection of General GRANT'S exploits was less fresh in 1872 than in 1868; but he was still the most presentable candidate of the regular Republican party, and the dissident or reforming section of the party, with their Democratic allies, threw away their chance by the ridiculous nomination of Mr. GREELEY. The enthusiasm with which General GRANT was regarded for some time after the end of the war has now wholly subsided. He has on many occasions plainly intimated his desire for a third term of office; but recent scandals, though they may not have directly affected his character, have destroyed all hopes of his re-election.

The election which will take place in the autumn, and the preliminary arrangements, create the same kind of excitement with a Derby on a gigantic scale. To the community as a whole it matters little which party or which candidate is preferred, but the final decision will be a gratifying triumph to those who may have backed the winner. The interest on the impending occasion will be greatly increased by the uncertainty which prevails as to the comparative strength of the two great parties. The Democrats carried the elections in 1874, and the Republicans in 1875, and it is impossible to say how the balance of opinion has since inclined. The party which is allied with the actual PRESIDENT and with the Senate controls the votes of the numerous office-holders throughout the Union; but expectants as well as incumbents have votes; and probably the Republicans have lost ground by the exposure of the widespread corruption which prevails at Washington. The Democrats, who were formerly discredited by the connexion of their party with the perpetrators of the New York frauds, at present enjoy the more gratifying office of prosecutors; and their party in the House of Representatives is not disposed to waste its opportunity. The charges against General BABCOCK are revived, notwithstanding his acquittal; and the impediments which render it difficult or impossible to proceed with the impeachment of General BELKNAP will not diminish the indignation which has been provoked by his conduct. The Republicans have endeavoured to trace a questionable connexion between Mr. PENDLETON, who is a possible Democratic nominee, and the delinquent SECRETARY for WAR; but Mr. PENDLETON seems to have satisfied a Committee of the House that the charge is unfounded. The brother of the PRESIDENT confesses his

participation in an arrangement which may be mildly described as a job. No direct charge has yet been made against the PRESIDENT; but the easy morality of a great officer of State who has the bad luck to be surrounded by friends and kinsmen of doubtful character will not suit the present temper of the people. Two ingenious appeals to popular prejudice have wholly failed. The PRESIDENT soon found that the country was not disposed to adopt a policy of aggression in Cuba; and the agitation which he commenced against the Roman Catholic Church has been appropriated by other politicians, who will probably suspend it until the Presidential election is decided.

On the whole it has become nearly certain that the PRESIDENT will not even be proposed as a candidate for nomination in the Republican Convention at Cincinnati. The interest of jobbing politicians will be not less appropriately represented by Mr. MORTON or Mr. CONKLING. It is possible that the Republican nominee may, if he is elected, be a good President, but it is quite certain that he will not have been previously distinguished. Of those who have hitherto been mentioned, Mr. BLAINE has perhaps the best chance of nomination. As Speaker of the last House of Representatives he acquired a reputation for Parliamentary adroitness which has since been enhanced by the skill with which he took the anti-Catholic movement out of the hands of the PRESIDENT. Mr. BRISTOW, now Secretary of the Treasury, is the best financier who has held office of late years, and he may perhaps be recommended to popular approval, though not to the favour of election-managers, by the energy with which he has prosecuted the inquiry into the revenue frauds. The Cincinnati Convention will not be disturbed by feelings of personal enthusiasm for any of the possible nominees. The Democrats are almost equally at a loss for a candidate who may unite the greatest number of votes. Mr. TILDEN, Governor of New York, has acquired just credit by his vigorous repression of municipal frauds, and he has displayed much administrative ability; but unluckily he holds sound and decided opinions on the currency; and it is thought that the Democrats of the Western States will not support a candidate who is pledged to promote the earliest possible resumption of specie currency. On the other hand, the autumn elections in Pennsylvania and Ohio are thought to have shown the danger of alienating the most enlightened States by the selection of a candidate pledged to inflation. Before the Convention meets at St. Louis the managers of the party will have exerted all their ingenuity in constructing some formula which may as far as possible satisfy both the advocates of a sound coinage and the partisans of inflation.

The embarrassment which is felt by both parties in devising political issues, and the abundant leisure which is not disturbed by any demand for legislative activity, have been curiously illustrated by a late debate in the House of Representatives on an abstract proposition. The Republicans thought that they could revive the popularity which they enjoyed ten years ago by a gratuitous and unseasonable appeal to the love of national unity. For this purpose they moved a Resolution that the people of the United States constitute one nation, and not a confederacy of States; that the national union is indissoluble; that no State has a right to judge of the constitutional character of laws; and that secession or rebellion against the Union is treason. Even if all these propositions were admitted as true there would be no reason for affirming them at a time when no State and no single citizen meditates a practical contravention of the Republican doctrine. If the Democrats had met the challenge by moving the previous question, they would have furnished the best comment on the party nature of the movement. Their leaders seem to have thought it more expedient to accept the challenge of the Republicans. They declared in a counter Resolution that the Government of the United States is a Federal Union with powers defined and limited by the Constitution. The doctrine of secession was, as they reasonably contended, settled by the result of the Civil War; but they held that the local government of the several States was necessary for the maintenance of freedom. The mistake which the Republicans had committed was shown by the desertion of several members of the party, with whose aid the Democratic Resolutions were carried by a majority of more than three to one. It is not to be supposed that the Presidential contest will be affected by a transparent contrivance for the promotion of party objects; but one of the singular results of the American Constitution is that the Legislature devotes the greater part of the Session to the purpose of influencing the election of the future head of the Executive. It is not the business of foreigners to criticize arrangements which must be presumed to suit the convenience of those whom they immediately concern. Intelligent Americans are offended by the practical anomalies which sometimes affect the working of their institutions, and they dislike and condemn the corruption which seems to be an inevitable result of the system; but they find that Washington jobs and idle Parliamentary talk are compatible with order, with freedom, and with prosperity; and they are so far independent of the character of Presidents and Congresses that no nation in the world is so little troubled by contact with Government. The distribution of power among the Union, the States, and the smaller political divisions, in some degree explains the public indifference to the issues which divide and occupy professional politicians.

THE ADMINISTRATION OF THE NAVY.

ON Monday Mr. BENTINCK revived an old controversy to very little purpose. The question whether the First Lord of the Admiralty ought necessarily to be a naval officer has often been discussed, and practical expediency has always pointed to the same conclusion—that, as a rule, it is work which is fitter for a civilian than for a professional man. The evidence taken by the Committee of 1871 supplied Mr. DISRAELI with abundant materials for justifying his opposition to Mr. BENTINCK'S motion. It is true that a large proportion of the witnesses before the Committee were civilians who had held office as head of the navy, and who might therefore be suspected of regarding with some degree of personal prepossession the suitability of civilians for such appointments. At the same time there were also naval witnesses who took the same view: and indeed it is only necessary to consider the practical conditions of the question in order to see that it would be impossible to lay down the rule that the First Lord should be invariably a naval officer, and never a civilian. No doubt a naval officer who possessed all the qualifications for the post would be the best man, but then the question is, what likelihood is there of finding a naval officer answering this ideal? Lord JOHN HAY said rather bluntly in his evidence that he had hardly ever seen a naval Lord whom he thought fit to be First Lord of the Admiralty; and it must be admitted that such persons are likely to be rare. It must be remembered that this is a country in which Parliamentary government prevails, and that this sort of government is not an absolutely perfect system, and must be taken with its advantages and disadvantages. It is easy to conceive that in a despotic country the navy might at a particular time be placed in the hands of a highly competent expert exercising absolute authority as the delegate of the sovereign, and might thus be brought into a high state of efficiency. In Russia, for instance, the navy is under the brother of the EMPEROR, who has a thorough professional knowledge of his work, and is also a man of great spirit and energy. The Grand Duke CONSTANTINE no doubt suffers in a certain way from that "eternal want of pence which vexes public men"; but, on the other hand, he is not troubled by the close and jealous supervision of a House of Commons, and the necessity of satisfying popular opinion in everything he does or proposes to do. The danger of this system is that, although it may be an admirable one when it is quite certain that the right man is in the right place, and knows what he is about, it leaves room for the possibility of a rash or inefficient man being put in a position where he may do incalculable mischief. In a free country such a system is obviously impossible. The Government must do, not just what it thinks best, but what the country approves, and in all important matters must carry the country with it. Moreover, it is impossible to keep the management of the navy altogether apart from current politics. The necessary strength of the navy must be measured by the purposes for which it is to be used; and it is indispensable that the head of the department should be a member of the Cabinet and in the full enjoyment of its confidence. It is clear, therefore, that the First Lord must be, to begin with, a politician and statesman, and in harmonious accord with the Ministry of the day. But how many naval officers have a chance of qualifying themselves for such a position? In order to

excel in their own profession, they must devote to it the greater part of their lives. They cannot be in the House of Commons and engaged in the active exercise of their profession at the same time; and it is usually, and indeed necessarily, late in life before they can take a seat in Parliament. On the other hand, although a civilian in such a position is at a disadvantage in regard to technical knowledge, this is required only for a part of his duties, and can in a great measure be supplied by professional advice. There is a great deal of ordinary administrative work for which the First Lord is responsible, and which any sensible man, with good business habits, is capable of looking after. The position, in fact, which the Parliamentary head of the navy occupies is not that of an expert who is supposed to know exactly what to do from his own knowledge and experience, and to be able to decide offhand for himself on any question, but simply that of a superintendent who is appointed to look after the interests of the country and to see that its wishes are complied with. When a private person has a house built he does not place himself absolutely in the hands of the architect or builder; he lays down the conditions on which he wishes the work done, changes his mind from time to time as to what he wants, and retains a controlling power over the style and cost of the edifice. And it is the same with the navy, and also with the army. The Parliamentary head of the army need not be a soldier any more than the head of the navy need be a sailor; what is wanted is a shrewd, sensible man of business, who is a good judge of what sort of people to trust, and who makes up his mind, like a jury, on the evidence before him.

When the position of a First Lord is distinctly understood, it is easy to see the course of duty which lies before him and the dangers to which he is exposed. He ought always to bear in mind that he is only officially and not personally responsible for decisions on professional matters as to which he, as a civilian, naturally knows very little, and that all he has to do is to form an intelligent decision upon the advice laid before him by those who possess practical knowledge. The danger is lest he should fancy himself entitled to make light of professional advice, when it does not accord with his own personal judgment. Mr. WARD HUNT, for example, may or may not be fit for the office he occupies; but if he is unfit, it is not because he is a civilian, but merely because he is personally incapable of that clear perception of his duty which is necessary to save a man in such a place from constant blundering. It must be borne in mind that Mr. HUNT has never shown himself remarkable for business aptitude. When Chancellor of the Exchequer he distinguished himself by one of the most extraordinary feats of bungling ever achieved by any holder of that office. In policy the purchase of the telegraphs was no doubt sound enough; but the manner in which the financial part of the transaction was managed was an almost incredible muddle. The railways were left entirely out of account, and a ring of stock-jobbers were allowed to plunder the public. At the Admiralty Mr. HUNT has still more conspicuously and consistently displayed his want of discretion and common sense. Of course it would be absurd to hold him responsible for the loss of the *Vanguard*, except perhaps in so far as the holiday character of the cruise and the undermanning of the ships may have indirectly contributed to the disaster. Mr. HUNT'S responsibility did not begin until he had the verdict of the court-martial before him. He had then to decide how far he should adopt it, and he took confidential counsel on the question with the naval Lords. Here arose a conflict of authorities; the court-martial who had heard the case thought one thing, the naval Lords who had not heard it thought differently; and Mr. HUNT, without allowing any further inquiry, gave a hasty decision in favour of his more intimate advisers. Whether the view he took was right or wrong is a point on which different opinions may be entertained, but there can be no question that he ought to have avoided a precipitate decision dealing with the whole of a subject which had only been partially investigated, and in the teeth of the judgment of a tribunal of high authority. In dealing with other disasters since he has been in office Mr. WARD HUNT has similarly shown his contempt for the ordinary securities of judicial investigation, and has acted, like an autocrat, on his own private impressions. No public notice has been taken by the Admiralty of such cases as those of the *Alberta*—the papers as to which, by the way, are still mysteriously delayed—the *Monarch*, and the *Iron Duke* in its second escapade. It may be that in each of these cases the conduct of the officers can be fully justified; but the suppression of the usual course of inquiry is clearly a violation of what is due both to the service and the public. A wise administrator would understand the possibilities of error which surround him, and would take care to fortify himself in any decision by obtaining the opinion of the regular tribunals, and justifying his acts by open evidence. Mr. HUNT'S defect is that he does not understand the pitfalls that lie in the way of a rash, self-confident administrator, who takes too much upon himself.

As regards ship-building, it can perhaps hardly be said that Mr. WARD HUNT'S administration has been much worse than that of his predecessors, but he has certainly shown that he wants the firmness of judgment which is essential in such an office. He began his career by declaring that we had only a phantom fleet, and immediately afterwards he had to admit that our navy had a substantial existence, and required only some small repairs. This year he still retains his confidence in its sufficiency. We have lost a valuable ironclad, but it is not thought necessary to replace it, and there is to be a large addition of gunboats instead. There is no doubt something to be said in favour of the policy of, as the Duke of SOMERSET said, putting our eggs in as many baskets as possible, but there is surely a medium between ironclad first-rates and gunboats which deserves attention. The mischief of the system at the Admiralty is that it does not maintain a steady course, but is always rushing from one extreme to the other. In 1870, for instance, as Mr. REED pointed out, four ships were laid down by the then Government, which was alarmed by the outbreak of war between France and Germany, and its possible contingencies. But the war was at an end before any of these vessels were ready, and consequently the money was thrown away, because the ships were not of the kind which would have been built except for an emergency. Again, it is evident that, if the gunboat branch of the navy is so desperately in want of reinforcement, it must be because it has been neglected; and now ironclads are to be neglected in order to attend to gunboats. This fitful and capricious attention now to one thing and then to another is surely not the way to secure an efficient service. Whatever may be thought of Mr. REED'S method of calculating the strength of our own and foreign navies, the admission of the FIRST LORD that the navy of France is to that of England as seventy-five to a hundred is, considering the relative circumstances of the two countries, a subject for something more than reflection. Nor ought the possible combination of foreign fleets, which, though individually weaker than our own, would be stronger in the aggregate, to be left out of account.

LANDED PROPERTY IN PRINCE EDWARD ISLAND.

THE compulsory transfer of property in Prince Edward Island may perhaps have alarmed nervous English landowners who have become acquainted with the transaction by occasional conversations in Parliament. The precedents of which the Irish Land Act was the first are likely to accumulate with constantly diminishing regard for rules which were once deemed immutable. Every separate act of interference with property is excused, and perhaps justified, by the special circumstances of the case; but the common principle that private right must yield to real or supposed public convenience acquires additional practical importance by each successive recognition of its validity. The expropriation of the landowners in Prince Edward Island has received the more or less willing assent of Lord GRANVILLE, Lord KIMBERLEY, Lord DUFFERIN, and Lord CARNARVON. It may therefore be assumed that some measure of the kind was necessary, or that it was less objectionable than the probable results of an alternative policy; but property is a delicate institution, depending for its security on unbroken custom. In Prince Edward Island, as in Ireland, the concessions which were professedly due to reasons of practical convenience had been clamorously demanded on revolutionary and communistic grounds. Occupiers who were impatient of the existence of landlords have for some years announced that property in land was a usurpation, and that the soil naturally belonged to the actual cultivators. It is probable that they may change their minds since they have acquired their freeholds for an almost nominal consideration. The occupiers of the island will repay the debt which

the Irish tenantry by furnishing arguments in favour of Mr. Butt's agitation for the transfer of the remaining rights of Irish landowners. After a time English proprietors will be reminded in turn that their interests also are subject to the discretion of the Legislature. Some of them are prematurely inviting attack by the suicidal policy of confiscating property which happens to be excepted from the ordinary course of hereditary succession.

It must be admitted that the absentee landowners of Prince Edward Island occupied an invidious position. Lord Carnarvon lately informed the House of Lords that about a hundred years ago the land was acquired by their predecessors in title through the odd machinery of a raffle. The prizes in the Crown lottery were estates of 20,000 acres each; and the winners, who perhaps scarcely understood where their new possessions were situated, could have little intention of colonizing the island in their own persons. The actual settlers have since held their tenements at a trifling rent, which has in most cases run into arrear. The prevalence and popularity of freehold tenures throughout the continent of North America not unnaturally rendered the islanders discontented with their position; but fifty or thirty years ago it would have been useless to ask the assent of a Lieutenant-Governor of the Colonial Office to measures for the compulsory acquisition of holdings by occupiers. The establishment and growth of popular power exercised by a democratic Legislature has since changed the conditions of the controversy. One of the parties in the dispute returns all the members, while the other only held the property which was coveted by the constituency. An analogous division between the basis of taxation and that of representation has in other countries produced the results which might be expected. In Prince Edward Island the question was not as to the distribution of public burdens, but as to the ownership of all the land in the colony. Several Bills were successively passed to enable the Government to buy out the proprietors on terms so inequitable that the Colonial Minister or the Governor-General of Canada refused to assent to them. Both Lord Dufferin and Lord Carnarvon at last sanctioned in 1875 an Act which has effected the object of abolishing leasehold tenures. It appears by a recital in the preamble that, when the island was annexed to Canada, the Government of the Dominion undertook to contribute eight hundred thousand dollars for the purpose of enabling the Government of the province to buy up the leasehold lands. The Act constituted a Commission which was to assess the compensation to be paid to the owners the Governor-General, the Lieutenant-Governor of the island, and the proprietors themselves respectively nominating one of the three Commissioners.

Mr. Childers, who was appointed a Commissioner by Lord Dufferin, was obliged to return to England after making an award on the claims of ten considerable proprietors. The principles on which he adjudicated have probably been adopted by his successors; and to those who are unacquainted with the country the results seem at least to explain the loudly expressed dissatisfaction of the expropriated owners. For the freehold of 130,000 acres of land the arbitrators awarded 60,000*l*. There is no reason to doubt either their competence or their impartiality, though the losers by the transaction may be excused for including the Commissioners in the blame which they impute to the provincial Legislature, to the Government of the Dominion, and to the Colonial Minister. By the 28th section of the Act the Commissioners are required to consider, amongst other things, the price at which other proprietors have sold their land, the arrears of rent, the gross rental already paid by the tenants during the previous six years, and the net receipts of the proprietor, the number of acres held by adverse claimants, and the possibility of ejecting them, and the condition of the original grants from the Crown. As the tenants have for many years, with the concurrence of the Legislature, baffled and thwarted the proprietors by all possible means in their efforts to assert their rights, their resistance to the law is now rewarded by a proportional diminution in the compensation allowed to the proprietor. Adverse claimants are probably squatters, with no title but possession; and the undoubted difficulty of ejecting them from their holdings authorizes a further deduction from the amount of compensation. The proprietors had protested loudly against all the measures of the provincial Assembly, including the Act of 1875; but it is not surprising that the smallness of the sums awarded by the Commissioners [illegible] not as a necessary consequence of previous legislation, but as a new and distinct grievance. No objection can be made to a provision that no percentage should be allowed for compulsory purchase. Residents in England who had inherited large tracts of land in a distant colony could not be supposed to feel any sentimental attachment to their estates. It must not be forgotten that all the deductions allowed by the Act really corresponded to draw backs from the value of the property. If no transfer had been effected, the leaseholders would constantly have become more turbulent and more contumacious.

The action of the provincial Legislature was first suggested by Lord Granville in a despatch which referred to the Irish Land Act, then recently passed. The principle of compulsory interference was common to Ireland and to the colony; but the reasons which were thought to render the application of the principle expedient were as different as the economic circumstances of the two countries. The remedies were also unlike, for in Ireland proprietors have not been compelled to sell their estates, and in Prince Edward Island there are no evicted tenants to receive compensation. In one country land was scarce and dear, and it was the object of incessant competition. Prince Edward Island is thinly settled, and some of the proprietors owned large tracts of uncultivated land. The universal establishment of freehold tenures will probably promote population and prosperity. Ireland was twenty years ago over-peopled; and it has at present a sufficient number of inhabitants. It is a cause for regret that the leasehold tenures in Prince Edward Island were not voluntarily commuted some years ago, when their proprietors might probably have secured more liberal terms. A similar measure would not be applicable to England, where the accumulation of large estates, and the customary relation of landlord and tenant, result in a great degree from economical causes; but there can be no doubt that the precedent will often be quoted. The Irish Land Act passed on the assurance of the Government that the recognition of exceptional circumstances would not affect the security of property in other parts of the United Kingdom; but one of Mr. Gladstone's colleagues has often since publicly contended that the principle of the Irish Act must in consistency be applied to England. Lord Dufferin and Lord Carnarvon may be acquitted of willingness to tamper with the foundations of property; but their authority will be hereafter invoked in favour of schemes for the redistribution of land.

AMENDMENTS TO THE COMMONS BILL.

If Mr. Fawcett is well advised, he will withdraw the motion of which he has given notice with regard to the Commons Bill. Before opposing the further progress of the measure he ought to be satisfied either that the law as it stands is satisfactory, or that the Bill proposing to amend it cannot be made to effect its professed purpose. It may perhaps be contended that the best thing that can be done about inclosures is not to make them, and that this object can be as well attained under the existing Acts as under any Bill that can be introduced. The objections to this policy are that there may still be cases in which a judicious inclosure would be a public benefit; that, even if there are no such cases, there is often need for the regulation of commons, which is impossible without an Act of Parliament of some sort; and that, so long as the feeling against inclosures is not embodied in an Act of Parliament, its continuance cannot be relied on. If the watchfulness of the opponents once slumbers, the machinery for effecting them lies ready to hand. If the law is altered in the sense proposed by Mr. Cross, the decision upon each inclosure will still rest with Parliament, but the preparation of the scheme will be surrounded with new difficulties. It will be much less easy to take Parliament by surprise than it is now; and, although the change may seem unimportant when Parliament is not likely to be taken by surprise, it may not be unimportant at some future time when Parliament has other things to think about. As regards the Bill itself, it may be true, as Mr. Fawcett's notice of motion says, that it "does not give adequate protection to the interests of the rural labourer, and does not "provide proper securities against the inclosure of those "commons which it is desirable to preserve in their unin-"closed condition for the use and enjoyment of the people." But the question on going into Committee is not so much whether a Bill already contains all that ought to be in it,

as whether there is a fair probability that, before it leaves Committee, it can be made to contain all that ought to be in it. Mr. FAWCETT will not deny that the Commons Bill contains many useful provisions, and Mr. CROSS has declared his readiness to introduce any further provisions that can be shown to be conducive to the object he has in view. If there is to be legislation on the subject at all, it is not likely to take place under more favourable circumstances than when a Bill, which is admitted to point in the right direction, is in charge of a Minister who is honestly anxious to make it as perfect as possible.

Of the various amendments which appear in the Notice Paper, the most sweeping is that which Mr. COWPER-TEMPLE proposes to move on the second clause. As the Bill stands, it provides for two things—the regulation of commons and the inclosure of commons. Mr. COWPER-TEMPLE wishes to see it restricted to the first of these objects, and with this view he proposes to insert words forbidding the Inclosure Commissioners to entertain an application for the inclosure of a common either in whole or in part. To justify this amendment Mr. COWPER-TEMPLE must show, not that it is not expedient to inclose many commons—a process which would give him no difficulty—but that it is not expedient to inclose any. This is tantamount to saying that there is no common land in any part of England over which cultivation may beneficially be extended. This may be true as regards the neighbourhood of London or of other great towns—and when we say neighbourhood, we use the word in its largest sense, as applying to all waste spaces which lie within the limits of a long day's excursion—but there are probably cases in Yorkshire and the other Northern counties to which it is far from being yet applicable, cases in which judicious inclosure need not in any way injure the landscape or detract from the usefulness of the common land to the scanty population of the district. In the South, again, it is not always true that a common is either ornamental or useful. It may be simply a marsh which yields nothing except malaria, which is incapable of regulation, and which must consequently be either inclosed or left alone. There is no objection to making such changes in the Bill as will show unmistakably that regulation, not inclosure, is the object which the Legislature has most at heart, and the object to which the Commissioners are on all occasions to give precedence. But unless Mr. COWPER-TEMPLE is able to make out a very strong case indeed, this particular amendment ought not to be adopted. This objection does not apply to the words which Mr. FAWCETT proposes to insert in the preamble. As it is drawn, the clause recites that it is expedient to give further facilities to the Commissioners to deal with commons without inclosing them. Mr. FAWCETT would preface this by a recital that "it is no longer expedient, as recited by the General "Inclosure Act 1845, to facilitate the inclosure of com-"mons." This is no more than the truth. There is nothing in the Bill to make inclosures easier. All the new provisions are directed to making them less easy than they are by existing law, though not, owing to accidental circumstances, by existing practice. There can be no harm therefore in making the preamble of the Bill say plainly that, though powers for inclosing commons are incidentally included in it, it is not the intention of the Bill to make inclosures more numerous.

There are two notices of Mr. SHAW LEFEVRE'S which meet the objection that the Bill as it stands does not deal comprehensively with the whole subject. It provides a machinery for making inclosures, but it does not provide that no inclosure shall be effected without this machinery. Some of the worst inclosures have been made, not by the Inclosure Commissioners, but by private owners acting in defiance of law but in a comfortable assurance that no one will incur the cost of a lawsuit in order to stop them. Mr. SHAW LEFEVRE proposes to enact that, after the passing of the Act, any inclosure of a common existing at the time of such passing shall be unlawful unless sanctioned by Parliament under its provisions; and by another amendment he makes the remedy cheap and simple, by providing that any inclosure of a common or of any part thereof shall, unless sanctioned by Parliament, be deemed a public nuisance. If these provisions are inserted in the Bill, the whole law of the subject will be within the four corners of the Act. It is plain that when a machinery for effecting inclosures is provided by law, the prohibition against effecting them by any other means can hardly be made too precise or too stringent. In the present state of the law there is a standing temptation to effect inclosures by the simple process of setting up fences and notices to trespassers, in the belief that no one will be found with sufficient public spirit and a sufficiently long purse to appeal to a court of law for an order to get the fences taken down and the notice-boards removed. When the act of inclosing, except through the intervention of the Commissioners, is made a public nuisance, the uncertainty which now surrounds an appeal to the law courts will at all events be removed. It would be a useful addition to Mr. SHAW LEFEVRE'S amendment if the Commissioners were directed, on having the existence of any such nuisance brought to their knowledge, themselves to take proceedings for its abatement. This would be a perfectly appropriate function for Commissioners charged with the protection of public interests, and many persons would be found to give the Commissioners notice of an illegal inclosure who might not be ready to take even summary proceedings against the authors of it on their own account. Another amendment appears in Mr. SHAW LEFEVRE'S name, the object of which to provide that it shall not, as now, be fatal to the proof of the customary right of the inhabitants of a village to the use of the village green that it can be shown to have been used by other persons as well. Nothing can be more absurd than a law which allows the destruction of a village green because the benefit of it has been extended beyond the actual residents in the village. It would be as reasonable to declare that Hyde Park should be built over because it had been proved that country people as well as Londoners occasionally walked in it. Still, absurd as this reasoning is, it seems to be well-ascertained law, and, being such, it ought plainly to be dealt with in any Bill which professes to deal with the whole subject of commons inclosure. There are several amendments of smaller moment on the Notice Paper, chiefly referring to the public meeting which the Assistant-Commissioner is directed to hold for the purpose of ascertaining the local feeling about a proposed inclosure. Some of these relate to the time at which the meeting shall be held, and others to the publicity of the notices given of it. Mr. MACDONALD proposes that a poll of the inhabitants of the parish in which the common is situated may be demanded by any inhabitant who is dissatisfied with the result of the public meeting, and that the vote shall be taken by ballot. We cannot but think that this provision would in a great majority of cases involve a simple waste of money and labour. Where there is no real feeling on the subject among the inhabitants the poll would be a mere form; where there is such a feeling, sufficient means for the expression of it, and for bringing that expression to the knowledge of Parliament, seem already to be provided.

Two important points remain which are not yet touched by any of the amendments of which notice has been given. One is the absence of any instruction to the Commissioners to take care that the compensation given for rights of common shall, when possible, be similar in kind to the rights which are surrendered. It is all very well to give a labouring man a bit of garden ground, but he cannot keep a cow in a garden as he can on the common, and the loss of milk for his children is not made up by the power of growing a few cabbages. The other is the omission to give the authorities of large towns a *locus standi* in case of inclosures at a distance. It has been suggested, for example, that in the case of all proposed inclosures in Surrey or Kent, notice should be given to the Corporation of London. How necessary some provision of this kind is may be seen from the last Report of the Inclosure Commissioners. They have not in the least repented of their intention to inclose Wisley Common, a scheme which would involve the destruction of one of the most beautiful bits of landscape within easy reach of London, and the narrow interpretation they have hitherto placed upon their instructions makes it probable that they will renew the proposal even under the Commons Bill. Wisley has become a leading case in commons' inclosure, so that there is not much fear that any provisional order affecting it would be confirmed by Parliament. But, if it had not been rendered famous by former controversies, it would stand in great danger from its distance from any considerable town, and this risk would be averted by the necessity of giving the Corporation of London notice of every proposed inclosure in Surrey.

QUEEN OR EMPRESS.

IT was hard for the more philosopher to dispute with the master of fifty legions; and it is in some ways almost as hard to dispute with a Leader of the House of Commons or with a Leader or ex-Leader or *quasi*-Leader of Opposition. He cannot indeed throw his adversary to the lions, or bid him go and spend the rest of his days in a desert island. But he can do what for the purposes of argument is much the same; he can carry on the argument on his own terms. He can enter on a question which cannot be adequately discussed without going deep into historical arguments, and he may go just as deep into them as his own knowledge enables him, and no further. When he gets to the end of his own tether, he can dexterously imply that anybody who goes further must be a pedant or a dreaming antiquary. And if he does so, he is sure to be rewarded by a laugh. For the House of Commons, like all other assemblies and all individuals, if it does not exactly like to be complimented on its own ignorance, at least likes to be congratulated on the uselessness of the knowledge which it does not happen to possess. He may thus convey the comfortable impression that both himself and the House have hit upon the exact amount of knowledge which becomes them, that any more would be pedantry to be laughed at, while any less would have been ignorance to be ashamed of. In the debate a week back on the proposed title of Empress of India Mr. Disraeli used this art to perfection. He talked about the Antonines, because the House is conventionally supposed to have read Gibbon. He talked about Spenser, because the House is conventionally supposed to have mastered the polite literature of England. He just touched on Henry the Eighth and Charles the Fifth, with a hint that, in speaking of them, he had reached the utmost amount of knowledge that could be deemed decorous; "those might be considered antiquarian illustrations, and he would not dwell on them." Now whether antiquarian illustrations should be dwelled on in debating any question or not depends wholly on the nature of the subject. On some of the points which came before the House that same evening, Knightsbridge Barracks for instance, or Irish Workhouse Teachers, or even the Tichborne Claimant, "antiquarian illustrations" might well be quite out of place. Even on such questions an "antiquarian illustration" might possibly add point to some saying or other; but it could not supply any serious argument. But here Mr. Disraeli starts a question the whole force of which has its roots in the past, and then decries the only mode of investigation which can throw any light upon it. Here are two titles, one of which has, for at least fifteen hundred years, been deemed superior to another title. Mr. Disraeli has to maintain the paradox that it is not superior to it. Conscious that the witness of history is against him, he has to evade the witness of history; and very ingeniously he does it. "I deny that any Imperial dignity is superior to the Queenly title, and I defy any one to prove the reverse." Here comes in the appeal to what is mistakenly called loyalty, and that appeal is of course met with a cheer. Mr. Disraeli is of course "happy to hear that cheer." Now, as it is hard to refute a sneer, it is equally hard to refute a cheer; but neither the sneer nor the cheer gets rid of facts. Mr. Disraeli's defiance is something like the summons at the confirmation of a Bishop, where all objectors are invited to come forward, "and they shall be heard"; and yet, if they do come forward, they are not heard. The plain fact is that the title of Emperor is, and, ever since it came to denote sovereignty at all, always has been, held to be superior to that of King. No defiance, no sneering at "antiquarian illustrations," can get rid of the fact. Mr. Disraeli's own speech is one of the proofs of that fact. If Empress is not a higher title than Queen, what can be the motive for proposing that the Queen should take it? He implies that to assert that Empress is a higher title than Queen is disloyal, or something or other, towards the bearer of the lower title. Mr. Disraeli does not seem to understand that there is often more real dignity in a lower title than in a higher one. The Lord of Coucy was only Lord of Coucy; but he did not wish to be Count or Duke. A man who holds a barony conferred by Edward the First might think twice before he exchanged it for a dukedom conferred by Mr. Disraeli.

We have spoken so often of these questions that we think that we may assume in our readers some notion of the meaning of the word Emperor. We need not go through the whole story, from Augustus and Diocletian to William of Prussia. We assume that our readers have knowledge enough to smile at the odd little scraps of history which are all that Mr. Disraeli has lighted on. We feel sure that they will join with us in a general inward merriment at the moral certainty that, if Mr. Disraeli had known that there had been a long line of Emperors of Britain in early times, if he had known that the Act of Henry the Eighth and the phrase of Spenser are merely links, and not the last links, in a long chain, he would have found out that "antiquarian illustration" might be good for something. Mr. Disraeli may, before he speaks next time, have heard of a "Cyning and Casere totius Britanniæ"; he may even have got up the great dispute about Βασιλεύς and ῥήξ. If so, we shall be sure to hear something about it; the boundaries of Parliamentary knowledge will be enlarged for the nonce. But let us take Mr. Disraeli as he is, within, to quote his own words, "the range of a limited experience of which he may be proud." The talk about the Antonines is hardly worth refuting; it is perhaps enough to say that in their days the Emperor was still in form a republican magistrate, and also to remind Mr. Disraeli that Marcus was succeeded by Commodus. But Mr. Disraeli presently shows that the study which he gives to Gibbon is not extended to the proclamations which must have been sometimes put out by his own advice. "The Queen," he tells us, "is not her Royal Majesty. The Queen is described properly as Her Majesty. Therefore the clumsy periphrasis of 'Royal and Imperial Majesty' could never occur." Mr. Disraeli does not seem to know that to speak of "Her Majesty," unless her name or title has gone before, is, common as the phrase is, an ungrammatical vulgarism. The proper description is "the Queen's Majesty," "the Queen's Most Excellent Majesty;" and it is not a frivolous question to ask whether that formula is to be changed for "the Queen and Empress's Most Excellent Majesty." Again, a King is called Majesty; an Emperor, to mark the higher position which he claims, is called "Imperial Majesty." If Mr. Disraeli has ever travelled in any part of the Austro-Hungarian monarchy he must have often seen the letters K.K. or I.R., or even their full form, "Kaiserlich-königlich," the very formula which Mr. Disraeli says cannot occur. Officers in various branches are now well pleased to write R.N., R.E., R.A. after their names. It is not a frivolous question to ask whether they are to change them for something answering to the K.K. and I.R. of the compound monarchy just spoken of, and further whether it is to be I.R. or R.I. Then we plunge into Mr. Disraeli's little bit of general history:—"In times which will guide us in any way upon such a subject, I doubt whether there is any precedent of an Emperor ranking superior to a crowned head, unless that crowned head was his avowed feudatory." Mr. Disraeli, who has read Gibbon, may also perhaps have read Macaulay; if so, he may have lighted on passages speaking of "The Emperor, first in rank among Christian princes," "Cæsar in his solitary majesty," phrases which we trust need no explanation to any reader of ours. One smiles when Mr. Disraeli goes on to take what he calls "the most remarkable instance of Imperial sway in modern history." "The most remarkable instance" is of course the thing itself, the Empire handed on from Diocletian to Charles the Fifth, or, in the phrase of Mr. Disraeli, "when the Holy Roman Empire existed, and the German Emperor was crowned at Rome and was called Cæsar." We smile at Mr. Disraeli's grotesque confusions, and go on to what he seems to think a great discovery—namely, that "In those days there were great Kings; there were Kings of France, Kings of Spain, and Kings of England," and, Mr. Disraeli adds, "they never acknowledged the supremacy of the head of the Holy Roman Empire." "Never" sounds a little rash to one who has read the history of Richard the First; but nobody doubts the general truth of the assertion. Those Kings did not admit the supremacy of the Emperor; in the case of Henry the Eighth, quoted by Mr. Disraeli, and in a great number of other cases, they formally or implicitly denied it; but that denial is part of the case against Mr. Disraeli. People do not go out of their way to deny what nobody has asserted. The supremacy of the Emperor had to be denied, because it was asserted, because, while nobody doubted that the Imperial dignity was higher than the Royal, while nobody doubted that Cæsar was "Princeps terræ principum," it was expedient to have it understood that he was not practically "Mundi dominus." So again Mr. Disraeli's more modern Russian case tells equally against him. The Russian princes, on taking the title of Emperor, were required by other princes to declare that they did not thereby claim any special precedence. Why this pains about the matter, but because it was understood that, without such a disclaimer, the title would imply precedence, because such precedence was actually allowed to the one ancient and lawful bearer of the title? Still we should like to know something more clearly about the period of history when, as Mr. Disraeli so kindly informs the House, "several female sovereigns flourished in Russia." Mr. Disraeli's date is 1745, a most mysterious year certainly, and one specially interesting to female sovereigns, as it was that in which a Queen of Hungary and Archduchess of Austria in her own right became also Empress Consort of the Romans. What we do not quite understand is how in that year the Empress Elizabeth could have been "influenced by the circumstance that the first Congress of Aix-la-Chapelle was about to meet." Now the hearts of Kings, as the writers of Henry the Second's day are rather fond of reminding us, are inscrutable, and probably the hearts of Empresses are inscrutable also; so it may be that Elizabeth in 1745 was influenced by the circumstance that the Congress of Aix-la-Chapelle was going to meet in 1748. Smaller people would have been more likely to have been influenced by the circumstance that the Congress of Dresden was going to meet in that very year 1745. Then how about the first Congress of Aix-la-Chapelle in 1748, when most people know that an earlier peace was concluded there in 1668? To be sure Mr. Disraeli is not sure of all this, but thinks it only probable. If so, the probability is of that kind which we admit in the case of things which are too strange not to be true.

In short, Mr. Disraeli first asserts that the title of Emperor is not higher than that of King. He then quotes a few of the endless cases which prove that it is. From these he infers that the two titles mean the same thing; and lastly, because they mean the same thing, he proposes that one should be, if not taken instead of, at least added to the other. There is a tale of a Greek philosopher who said that life and death were the same to him; he was asked why then he did not kill himself, and answered "Because they are the same to me." When the plain question is put to Mr. Disraeli, If Empress and Queen are the same thing, why take the trouble to add one to the other? he first goes off into talk about Spenser, nuggets, and lovees, and ends by saying that "the change whose purport the Queen has allowed him to disclose will add splendour

even to her throne and security even to her Empire." If Empress and Queen are the same thing, what fresh splendour or security can be given by calling the Queen Empress?

We turn from the Leader of the Government to him who must still, whenever he chooses to act as such, be looked on as the real Leader of the Opposition. Every Englishman must go along with the eloquent words in which Mr. Gladstone asserted the dignity of the ancient and historic name of Queen of England. But, when Mr. Gladstone gets to the historical discussion of the two titles, he is even more unlucky than Mr. Disraeli. He is, as reported, unlucky to that degree that, if he were an ordinary member speaking on a Wednesday, we should give him the benefit of the judgment of charity, and believe that what is put into his mouth was due to the reporters, and not to himself. But when a member like Mr. Gladstone is speaking on a question like this, we are bound to suppose that some attempt is made to make the report correspond with the speech. It is amazing when we read:—

> If I take the Kingship of the Emperor of Austria when he was King of the Romans and also King of Hungary, I find that he was never heard of as King of Hungary or King of the Romans, except in the days when he was crowned with the iron crown in the Cathedral of Milan. He was called Emperor of Austria, and in that title the Kingship was swallowed up.

Whether this comes from Mr. Gladstone or from a reporter, we will not insult our readers by enlarging on the singular chain of confusions which it implies; we will only suggest that the sentence would not be a bad one to set in an examination for the candidates to work out. But what follows is, if possible, more astounding still. "The King of Prussia, when he became German Emperor, ceased, I believe, to be King of Prussia—whether he is so technically or not, I cannot say—and his Kingship also became entirely absorbed." This really takes away our breath. Is it possible that any one, whether Mr. Gladstone or a reporter, can have a moment's doubt as to "Wilhelm Kaiser und König" being just as much King of Prussia as he ever was? Are not the Empire and the Kingdom which is a part of it perfectly distinct? Is there not a Parliament of the Empire and a Parliament of the Kingdom, and is not the popular branch of the Parliament of the Empire elected by universal suffrage, while the Parliament of the Kingdom is not? In this case, it is not Emperor but King which is the absorbing title. Emperor has not absorbed King, but King has absorbed Duke, Margrave, and other smaller names. Then we are told that the title of King is hereditary and the title of Emperor is elective. "If we except Poland, there is no other very strong case we can quote historically of the elective character in conjunction with the title of King." We really need not go about to prove that nearly every kingdom in Europe is a very strong case to the contrary; it may be enough to ask how Mr. Gladstone supposes that the Emperor first became King of the Romans, and to remind him of the long line of English Kings who came to their crown "as men chose them thereto." There is however this difference between Mr. Gladstone's speech and Mr. Disraeli's; both the sound and the unsound parts of it are evidently natural, while Mr. Disraeli's is evidently got up. But it is a little disheartening, when a question arises which can only be discussed on strictly historical ground, to see the foremost men on each side of the House of Commons displaying so small an acquaintance with the history of their own country and of the world in general as was displayed in the debate on the second reading of the Royal Titles Bill.

LONDON AND THE MANOR OF LYLLESTON.

THE westward progress of the Gallows, from Smithfield to Paddington, would enable us, if we could trace it, to solve some obscure points in London geography. Until they got as far as St. Giles's Pound, near the junction of Tottenham Court Road with Oxford Street, they retained their early title of "The Elms." There were "Elms" in many places besides London. In some the name has lingered on, though its origin is forgotten, and many a suburban villa derives, in all probability, its genteel appellation from the former presence of a gibbet on the site. It was at the Elms in Smithfield that Wallace, Fraser, and Athol suffered. At St. Giles's the Cobham rioters were hanged, in the reign of Henry V. But at the execution of Mortimer in 1330 we first find the gallows at Tyburn, and henceforth we hear no more of the Elms. They had acquired a more enduring title when the popular ear connected Tyburn with the modes of execution chiefly in vogue. Nor is it surprising that when the gallows were removed westward the name moved with them; and so we have a new Tyburn, not in the manor of Tyburn, but in the manor of Lylleston, and not by the burnside, but on the summit of the neighbouring hill. Lylleston, no doubt, had little anxiety to be identified with Tyburn, and acquiesced silently in the misapplication of the name, withdrawing, for its own part, towards the north-west; so that while, in the beginning of the fifteenth century, the old original Tyburn became St. Marylebone, the manor of Lylleston became Lisson Grove, a name now only remembered in a comparatively remote corner of what was once all Lylleston. But the gallows did not rest there. Crossing the "road to Edgware," they migrated again, and this time found for themselves a third Tyburn, in a real brook, which, rising near the church at Paddington, flows south into the Park; and though it is said to have been generally dry, the course of the stream is clearly marked by a depression on the Bayswater Road, where the cemetery which contains the remains of Laurence Sterne and many other great men is concealed behind a kind of overgrown vestry. This was the last Tyburn, the Tyburn of modern history. Here it was that Hogarth's "Idle Apprentice" met his fate; here ninety-nine years ago Dr. Dodd was hanged for forging the signature of the young Lord Chesterfield. During the last years before Tyburn, as a national institution, was abolished, the gallows were taken down and set up on each occasion, at a spot near the foot of the Edgware Road; the beams of which the fatal triangle was formed being kept between whiles at the "Carpenters' Arms," an inn which still remains, though sheriffs and juries no longer dine there after the executions as in the good days of old. The strangest sight perhaps that the hill ever witnessed was the posthumous dishonour done to the bodies of Cromwell, Ireton, and Bradshaw after the Restoration, of which an eye-witness has left some particulars. Mr. Thomas Smith, who wrote a curious little book on the history of Hyde Park, quotes from a manuscript diary the information that Cromwell's cere-cloth was green in colour and very fresh. Bradshaw's body had not been embalmed, but was simply wrapped in a winding-sheet, and though the nose had perished, the writer says, "I knew his face," going on to mention that the fingers and toes were pulled off by the mob and handed round, and that he had some of them in his possession "Ireton," we read, "hung like a dried rat."

It is curious now, when all the natural features of the region have been disguised, to see how completely the old names have perished also. Few people would think of identifying Tyburn with the districts round Cavendish Square and Portland Place, and fewer still would have an idea where to place Lylleston on the London map. But, by a curious train of events, Tyburn has become a name of historical importance, and Lylleston has so utterly disappeared that even such a learned man as the late Mr. Lambert Larking, in his volume on the Hospitallers, published in 1857 by the Camden Society, seems not to have known where it was, and puts "(Littleton?)" to the word in his index. Yet Lylleston is really the site of what most of us know as Tyburn, and Tyburn itself has become St. Marylebone. To distinguish the two manors it is necessary to go back to Domesday itself, and to thread a maze of subdivisions so complicated that even the painstaking Lysons gave up the attempt. Lisson, or Lylleston, is the western half of the parish of St. Marylebone, and may be roughly described as the portion which has Duke Street, Manchester Square, and Baker Street on the east, and Edgware Road on the west. In reality its eastern frontier was marked by the bourne or brook which has given its name, first to Tyburn, and afterwards to St. Mary "le Borne," and which, rising on the south-western slope of Hampstead Hill, runs close by Lord Hertford's villa in the Regent's Park, crosses the road opposite Sussex Place, and reaches High Street a little south of the cemetery. The road from Edgware, on the other hand, following, as it did, the direction of the Watling Street, is perfectly straight, until it reaches Hyde Park, where its further progress towards the Thames is now stopped. Two hundred years ago the greater part of the manor was void of buildings, and though we have not equal information regarding both the northern and the southern districts into which it was early divided, we know something of the gradual increase of the buildings. The manor was one of those marked in Domesday as "terra in elemosina data," and was in the occupation of one Edeva, who held it of the King. It was worth sixty shillings, and was assessed for five hides. It would be interesting to know how it came to the Hospitallers, and when. But in 1338 it was among the possessions of the Priory of St. John at Clerkenwell, and contained, as we read, twenty acres of meadow, with a hundred of wood, and was worth ten pounds. It was then occupied by "Dominus Willelmus de Clyf" for the term of his life, and "unum mesuagium" is spoken of as upon it. So far, it seems to have been undivided. There was much wild land. There was some farm land; and the manor-house very probably stood where, with a different name, it still stands. There is no mention of the gallows, but when we get another and later account of the manor, they had evidently been long set up in the south-western corner. In 1512 the Prior of the Order, "Lord Thomas Docwra," granted to John Blennerhasset and Johan his wife a lease for fifty years of a farm which comprises the whole of what is now the Portman estate. The farm is very fully described, and has never since been divided. It is called a "parcel of the manor of Lilestone, in the county of Middlesex, late in the tenure of Thomas Hobson, under the annual rent of 8*l.*, payable at their house in Clerkenwell," and consisted of six fields, besides twenty acres of "Furse Croft" and two closes called "Shepcott Hawe," which may be translated into the bushes by the sheepfold. The names of the six fields are the most valuable. From them we learn, not only that people were hanged in the neighbourhood, but that they were there hanged in chains, and that, for the rest, the district resembled the neighbouring districts of Hyde and Marylebone in that it was devoted to field sports. It was sometimes said a little later that Henry VIII. could pass from his palace at St. James's to Highgate through hunting grounds; and we can well understand it when we read that, besides the Great Gibbet Field and the Little Gibbet Field, this estate contained a place for badger-baiting, the Brock stand, as well as a Hawk Field and a Tassel Croft, where probably falcons were trained. The exact situation of each of these divisions cannot now be ascertained. The two Gibbet Fields were probably towards the south-western corner; the furzes and hawe beyond a depression, almost amount-

ing to the dignity of a ravine, which ran east and west a little to the northward of what is now Upper Berkeley Street.

Of Thomas Hobson, the tenant before Blennerhasset, we know little, except that he leased much land in this part of London. Certain it is that the two greatest estates now in the parish, those namely of the Duke of Portland and of the Viscount Portman, as well as a piece of the Regent's Park, all belonged to him, and had he but foreseen their future importance, we might now have among our dukes a name upon which so far little lustre has been shed, though it is not wholly unknown to fame. The Cambridge carrier of a later generation, the owner of the dog whose pride occasioned its violent death, the man who let horses to undergraduates, and insisted on their always taking the one which had rested longest and stood next the door (whence "Hobson's choice"), might, if old Thomas Hobson had known better, have figured with Seymours and Bentincks among our most ancient nobility. But the chance of founding a great family was seized with much greater foresight by the Chief Justice, Sir William Portman. He first bought the lease from Blennerhasset's executors, and after the dissolution bought the reversion of the freehold. This reversion had been sold or given by Philip and Mary to one William Morgan and another, having fallen to the Crown on the dissolution; and so when Sir William's lease ran out he became the owner, and the two hundred and twenty acres, including Great Gibbet Field and Little Gibbet Field, became the Portman estate. To trace the further descent of the farm would be only tedious; but, in order to understand the significance of the names which have so completely superseded those of the Great Gibbet Field and the rest, we may note that the male line of the Portmans failed with the great-grandson of Sir William, on which the estate went to William Berkeley, whose mother, a Spelo, was niece of the last of the Portmans. The Berkeleys however, did not inherit at once, as the estate was bequathed first to one of the Seymours, a descendant of the Protector Somerset. Thus we have Berkeley Street and Seymour Street, and, from the original name of the owner, now assumed by the Berkeleys, we have Portman Square, which was begun about the year 1760. Previously "Great Berkeley Street" ran from Manchester Square to the Edgware Road, and the square was not completed for upwards of twenty years. Most of the houses have been built since the middle of the last century, and two Adam Streets and two Quebec Streets supply us both with the name of the architect and an approximate date, though fashion did not incline to the new district until the monthly show at "Tyburn" had been abolished in 1783. Orchard-Portman and Bryanston in Dorsetshire, the country seats of its possessors, give their names to various blocks of building, and though the Board of Works have "abolished subsidiary names," and one of the Adam Streets has disappeared, it was easy a few years ago to distinguish the boundaries of the estate by the names at the corners. The present value of this farm it would be impossible to estimate correctly, but it may be worth while to observe that the eight pounds which was Hobson's rent for the present Portman estate would, if multiplied by twenty, only bring a sum equal to what is now paid for a moderately good house on the same land; and there are probably as many as fifteen hundred such houses on the estate.

The Portman estate, however, forms only a part of the whole manor. The house and park about it had a very different history, and one by no means so simple as that of the manor farm. The grounds were divided and subdivided. A part once marked by Lyon Place, a "subsidiary name" in Edgware Road, was purchased by Lyon, the founder of Harrow School; but the greater portion of the shrunk manor of Lylleston, then known as Lisson Grove, together with the manor-house, was in 1792 the property of a certain Captain Lloyd of the Guards. He sold it in lots, and the number of owners was indefinitely increased, though a great part of the estate, and the manor-house itself, passed into the hands of a Mr. Harcourt. He rebuilt the house in a handsome style, and it still exists, though its original name is long forgotten. The usefulness of Queen Charlotte's Lying-in Hospital might be impaired if it were still called Lylleston Manor House; but a future biographer may find it a convenient way of mentioning the birthplace of some one who has risen in the world. The park and mansion have thus lost their ancient character; the house has become a hospital, and the park a labyrinth of crowded and squalid dwellings; while the farm, when it had for centuries been identified with all that is disreputable in our annals, and had been, so to speak, repudiated by the manor, and forced to change its name, has now become the site of a quarter hardly less fashionable than the neighbouring Grosvenor district. If the name of Tyburn survives at all, it is neither in the original Tyburn, nor even in Lylleston, the later Tyburn, but in Tyburnia, the more aristocratic part of the parish of Paddington. The "unum messuagium" of 1338 has been turned into the thousands of houses, the hundreds of streets and squares, which reach from Manchester Square to the Edgware Road. An iron tablet in the Park railing is all that remains of the turnpike. Tyburn Lane has become Park Lane, and Tyburn Road Oxford Street. The modern inquirer will endeavour in vain to identify Great Gibbet Field with Portman Square, or Shepcott Hawe with the site of Quebec Chapel.

WALT WHITMAN.

A STRANGELY impudent agitation has just been started with regard to what is called "Walt Whitman's Actual American Position." Whitman, it may be explained, is an American writer who some years back attracted attention by a volume of so-called poems which were chiefly remarkable for their absurd extravagance and shameless obscenity, and who has since, we are glad to say, been little heard of among decent people. It now appears that, although there is a small *coterie* of persons in this country who are not ashamed to confess their liking for Whitman's nastiness, his own countrymen have universally repudiated him. "The real truth," says an American journal, which has taken up the subject apparently in the interest of Whitman, "is that, with the exception of a very few readers, Whitman's poems in their public reception have fallen still-born in this country. They have been met, and are met to-day, with the determined denial, disgust, and scorn of orthodox American authors, publishers, and editors, and in a pecuniary and worldly sense have certainly wrecked the life of their author." "No established publishing house will publish his books. Most of the stores will not even sell them." "Repeated attempts to secure a small income by writing for the magazines during his illness have been utter failures. The *Atlantic* will not touch him. His offerings to *Scribner* are returned with insulting notes; the *Galaxy* the same. *Harper's* did print a couple of his pieces two years ago, but imperative orders from head-quarters have stopped anything further. All the established American poets studiously ignore Whitman." We are of course sorry that Whitman, or any other man, should be in sore distress, but we must say that we are very glad indeed to hear that his writings are unsaleable, and that no respectable publisher or editor in America will give him countenance by printing his contributions. This fact, if it is true, shows that the moral sense of the American public is, after all, not quite so much deadened as some recent events might lead one to imagine. If the *New York Herald* will not have anything to do with Walt Whitman, it is a proof that even the *Herald* draws the line somewhere. We can only regret that the same view is not taken by all publishers on this side of the ocean, and that there is one firm at least in London which is not ashamed to advertise a "complete" edition of Whitman's works. We have no desire to pry into the details of Whitman's private life. The description which he gives of himself in his writings as "disorderly, fleshly, sensual," and fond of loafing, is not perhaps to be taken in a literal sense; and in any case we have no desire to speculate as to how far his private life may have been imprudent or irregular. The important fact is that he has found it impossible to get a living by his writings, which are everywhere shunned and rejected. Considering the character of these writings, this seems to us a very natural and desirable result, and it is difficult to understand why people should be expected to buy an article which disgusts them. Some of Mr. Whitman's friends and admirers in London have, however, worked themselves into a state of theatrical indignation with regard to the treatment of this great man by his unappreciative and ungrateful countrymen. Mr. Robert Buchanan, who has made himself the mouthpiece of this extraordinary agitation, not only claims for Whitman "literary immortality," but exalts his "ineffable goodness" and "beneficence," and declares, in a passage flavoured with a touch of blasphemy which we prefer not to quote, that "only this last consecration of Martyrdom was wanting to complete our poet's apotheosis." Mr. Buchanan, being himself a poet, naturally chafes against the restraints of ordinary prose, and we are treated to a wonderful picture, in the highest style of fine language, of a "golden eagle sick to death, worn with age and famine, or with both, passing with weary waft of wing from promontory to promontory, from peak to peak, pursued by a crowd of prosperous rooks and crows, who fall screaming back whenever the noble bird turns his indignant head, and which follow frantically once more, hooting behind him, whenever he ascends again on his way." This is all very fine no doubt in its way, but it may be thought to be hardly a fair description of the case of a dirty bird which is shunned on account of its unclean habits. Mr. Buchanan also breaks out into furious vituperation against all American publishers and men of letters, whom he abuses in the most vulgar terms; and warns the American nation collectively that its "honour will be tarnished eternally by the murder of its only remaining prophet." Mr. Buchanan concludes by what is really an insulting appeal to his own countrymen, as "loving and revering" this apostle of beastliness, to give him "a substantial proof of the honour in which he is held here in the heart of England."

From the height of this rhapsodical outburst it is a sad descent to the prosaic facts of the case. It is of course open to any one who admires, or is simply sorry for, Whitman to subscribe for his support; but it is difficult to understand why those who dislike his flagrant indecencies should be denounced because they do not feel inclined to give him any encouragement. Mr. Buchanan himself, though he does not scruple to rank Whitman with the Saviour, and declares that his teaching is "as Heavenly manna," thinks it necessary to "disclaim entire sympathy with Whitman's materialistic idealism, which seems to go too far in the direction of illuminating the execrable." Mr. Buchanan does not explain exactly what he means by "execrable," but in any sense such an admission goes far to justify the distrust and loathing with which Whitman is regarded both here and in America. Mr. Buchanan holds that "these great experiments in poetry" are "destined to exercise an extraordinary influence on the future of religion as well as poetry," and this, he

says, "no one who has read his works will deny." Public opinion, however, both here and in America, has expressed itself very decisively as to these great experiments; and there is very little chance of Mr. Buchanan or any of his associates bringing the world round to a different view. It is no doubt true that there are many people who have never read Whitman's so-called poetry all through, but enough is known to show that it is an attempt to make animal brutality and indecency pass for poetry. No doubt the present effort to revive curiosity on the subject will be a useful advertisement to any bookseller who happens to have a stock of Whitman's garbage on hand. It must be remembered, however, that his earlier works have been before the public for some twenty years, and that during the whole of that time the opinion originally formed of them has been steadily sustained, and, if possible, intensified; and there is, we imagine, very little danger of this judgment being now reversed by friendly puffery and agitation, even when such great authorities as Mr. Buchanan supposes himself to be take up the matter. There are, no doubt, questions both of art and philosophy on which public opinion at times goes astray; but in the present instance the elementary instincts of mankind are sufficient to settle the question. There would indeed need to be a very remarkable change both in the moral and intellectual constitution of educated people before such writings as those of Whitman could be accepted as, in any sense, honest literature.

When Mr. Buchanan screeches about "literary outlawry," "murder," and "official persecution," he is obviously only talking nonsense. We have no desire to say anything in disparagement of American publishers, but they are no doubt not absolutely exempt from the weaknesses of other tradesmen; and we suspect that, if there really were a market anywhere for Whitman's wares, he would have no difficulty in finding some one to retail them for him. It is reasonable to assume that American publishers and editors know their own business, and that they have sufficient reasons for having nothing to do with Mr. Whitman. He has chosen to identify himself with unsavoury things, and whatever he might now write, his name would be a taint to any respectable periodical. The fact is that it was only the indecent exposure which Whitman made of himself in the first instance that attracted passing attention to him as a sort of psychological monstrosity. Apart from his scandalous eccentricities, his writings are poor stuff, and the affectation of deep philosophy is easily seen through. The assumption that a man who sets himself to outrage public decency should be gratefully supported by public charity is certainly a very curious one. Mr. Buchanan asserts that his idol has many worshippers in this country, but we venture to say that this is a part of his delusion; and we may add that those who are so unfortunate in their tastes as to belong to this sect would perhaps act prudently for themselves in not proclaiming it too loudly. The conclusion would seem to be that the "illumination of the execrable" is not a remunerative business; and so far the lesson is a useful one, and may be taken to heart by any other writers who have a weakness that way. There is also, however, a general principle underlying Mr. Buchanan's letter which deserves notice. He appears to imagine that society is bound, as a matter of course, to contribute to the maintenance of any one who chooses to set up as a man of genius. The genius may be less apparent than some other characteristics, but society is bound all the same to accept implicitly the claimant's own assurance, and that of a few sympathetic friends, that he is a genius, and to provide for him accordingly. This, we fancy, is a favourite idea with a certain class of poets, who have usually reasons of their own for holding that their incomes ought not to be dependent merely on the popularity of their works and the respect in which they are held by those who know them. Instances can no doubt be mentioned of great poets who were not sufficiently appreciated while alive; but, on the other hand, it would be rather hazardous to undertake to provide for every one who, believing himself to be a poet, could not get a living by his works. We should then have a fine flock of hard-up "golden eagles" eager to take advantage of public charity. If the appeal on behalf of Whitman were based simply on his age and indigence, we should not think ourselves bound to say anything against it. But the plan proposed is to help him to circulate his writings, and thus implies approval of them. It is satisfactory to believe that agitation for such a purpose is likely to prove as futile as it is audacious.

MONTALEMBERT'S LAST WORDS.

OUR readers may recollect that we referred some weeks ago to a violent attack made in the Ultramontane newspapers, both English and foreign, on Dr. Döllinger and Mr. Gladstone, for an alleged breach of honour and good faith. They were charged with publishing private papers of the late Count de Montalembert, which happened to have fallen into their hands, in defiance of the wishes, and even the urgent request, of his natural representatives, and to the injury of his reputation. "Indecent," "insulting," "scandalous," "blackening character," were among the polite epithets lavished on the "distinguished" culprits. We were able to state at the time that Mr. Gladstone had nothing whatever to do with the matter, and we ventured to surmise with tolerable confidence that, if Dr. Döllinger was really concerned in it, he had good reasons for acting as he did, and had violated no confidence. The mystery is cleared up now, and it turns out as we suspected—first, that Dr. Döllinger had as little to do with the publication as Mr. Gladstone, and, secondly, that it took place in accordance with the express directions of the illustrious author himself. The famous paper—for such it has now become—*L'Espagne et la Liberté* is now in course of publication in the *Bibliothèque Universelle et Revue Suisse*, and the editor prefixes to the first part of it, in the number for January, an explanatory notice. When the article was refused admission into the *Correspondant*, Montalembert sent copies of it to several friends, among whom was Father Hyacinthe, and a letter addressed to him on January 17, 1869, expressly authorized its publication after his death. This authorization was never revoked, although the two friends were in constant and affectionate intercourse to the last. Father Hyacinthe accordingly wrote after Montalembert's death to his family and executors to ascertain their intentions about the paper, and they replied that it would appear in one of the volumes of his posthumous works. He therefore took no further steps himself, but after waiting five years he has naturally judged it quite time to carry out Montalembert's directions, which it had become pretty clear would otherwise remain a dead letter. This article is, as the editor remarks, "in some sort his political, literary, and religious testament." And we may add for ourselves that it acquires a still further interest from its direct bearing on the present circumstances of Spain. Only the other day the *Times* quoted from the *Voce della Verità* an article on the collapse of the Carlist insurrection, embodying, in language sufficiently unequivocal, the very principles which it was Montalembert's aim to combat and denounce in these, his almost dying words. It speaks of the suppression of "*Christian principles* identified in Carlism," of the Alfonsists as monarchical traitors, "opposing a bastard Christianity to Catholicism," and of the failure of "the two Christian Monarchies" (of Henry V. and Charles VII.) in France and Spain. We give one short extract:—

> In Spain, who believes in pacification after the defeat of Charles VII.? The religious act which the Madrid diplomatists celebrated in Rome on Sunday last in the church of Santa Maria di Monserrato, instead of a *Te Deum*, should have been a *Miserere*. The great misfortunes of poor Spain commence now.

What Montalembert thought of the position of Don Carlos and Isabella will appear presently. But he takes a more comprehensive view of Spanish affairs, and traces the evils under which the country is now suffering to causes long anterior to any modern quarrel of rival claimants for the throne.

We are bidden at the beginning to contemplate the "grand and prodigious spectacle and lesson" of what was once the first nation in the Christian world, now enervated, debased, poisoned, dishonoured by a long course of spiritual and temporal despotism—the absolute monarchy and the Inquisition. The writer recalls with enthusiasm the "rude and robust adolescence" of its heroic age, which four centuries of despotism have destroyed. For up to the end of the fourteenth century the power of the Inquisition was hardly felt, and Jews and Moors were left in peace. The eight marvellous centuries which went before, whatever their occasional faults of pride and cruelty, present a noble spectacle on the whole, in marked contrast to the subsequent period; "jamais l'ombre du valet ni du courtisan. Toute bassesse y est inconnue, impossible." "Spain up to the nineteenth century was a confederacy of republics, rather municipal than feudal, of which the Kings were but the presidents, each having its own laws, usages, rights, spirit, and distinct individual life. There was life and independence everywhere." It was the prototype of that English Constitution which Montalembert so ardently admired:—

> Strange and wholly forgotten as it is, and though it seems almost incredible, it cannot be denied that the Spanish preceded by a century the English themselves in the understanding, acquisition, and practice of all public and civil liberties. A parliamentary royalty, restrained and controlled, that is, by the national assemblies, when already lost in France and scarcely sketched out in England, was universally recognized in Spain, when the Black Prince came to fight with our Duguesclin. The English historians, with Robertson at their head, are the first to avow it.

But on this glorious past there supervened the most lamentable transformation the world has ever witnessed. "And for what cause? The abdication of an entire people in favour of its masters, and the too intimate union of the altar and the throne." It was when the monarchy absorbed all power, with the aid of the Inquisition, and the victorious Church abused its victory by proscribing first Jews, then Moors, then Protestants, then all discussion, research, or liberty, that all was lost. The once noble nation degenerated into a race of persecutors and slaves. Without at all adopting the modern dream of an absolute separation of Church and State, the author thinks even that a thousandfold preferable to the absorption of either power by the other, and their mutual identification and "*exploitation*." But for more than three centuries the Inquisition, "created for the service of God and their Highnesses," as the first Grand Inquisitor said in 1484, was the scourge of Spain and the horror of the Christian world, an irresponsible secret police, superseding even episcopal authority. Catholics indeed have abundant reason to curse its memory, but not—the author thinks—contemporary democrats, whose cause it has served, and whom it has supplied with a precedent; the Inquisition was the model of our modern terrorists. This monstrous institution became the vampire which at last swallowed up all society, and never ceased to live till it had left nothing to destroy. The period of despotism began with Charles V., "who enthroned Cæsarism in the freest of all countries, and infected the whole of Europe." And to this evil father succeeded a yet more evil son, Philip II., who consummated his work. "The soul of Spain was petrified in his bloody hands; henceforth it only survived in a state of intermittent

sleep, broken by *autos-da-fé*." And the condition of its subject States was, if possible, worse. We may take as an example Guzman, Viceroy of Naples from 1637 to 1644, who boasted that he had not left four families in a condition to make a good meal. The destruction of all intellectual life naturally followed the destruction of all public and civil life. "Ignorance and stupidity became the one way of salvation." Material decadence followed on moral; the country became depopulated and sterile, and at last, "army, marine, commerce, industry, agriculture, population, science, literature, arts, influence, all disappeared together." There is not such another example of national ruin in history. From the sixteenth century Spain has had no great statesman, general, or prince: in the eighteenth she had not even an artist or author worth naming, while France, England, and Germany were in the zenith of their glory. The Marquis of Argenson, Foreign Minister of Louis XV., after examining the condition of Spain, speaks of a "corrupt Court, courtier ministers, greedy women, *maîtres et intrigantes*"; of a cruel and superstitious piety, whole provinces without inhabitants, and winds up his description, "Un roi espagnol n'est que le chef d'un serail dévot." At last came Napoleon and Murat, and the Inquisition terminated its shameful and hideous career by wallowing in the dust at their feet; it published an edict, the day after the rising of Madrid and the atrocious massacre of innocents, covering the French with eulogies, and stigmatizing its countrymen as "seditious, treacherous, and rebellious."

And here Montalembert pauses in his gloomy retrospect to inquire what are the hopes of a recovery of Spain. Every one acknowledges the fine qualities of the people, misgoverned and corrupted as they have been. They are good, courteous, affable, hospitable, full of natural grace and dignity, sober, frugal, and high-spirited; and the poison of tyranny has not here, as in the East, tainted the sources of life. He therefore hopes for their recovery, "with the fervour of Christian charity and liberal fraternity," but does not venture to predict it. There is indeed no incompatibility between the masculine and free spirit of the people and their religious faith, which has, in truth, imparted to it a fresh energy and ardour; the fault lay in the too close alliance between the Church and the absolute monarchy. As to the quarrel between the rival dynasties, the fact happens to be that Isabella represents the ancient Spanish right, and Don Carlos a novel right, the sole creation of monarchical omnipotence; though, by a strange caprice of destiny, she has been taken to represent modern ideas, and Don Carlos all the superannuated and retrograde interests and sympathies of absolutism, and he has accordingly had the support of the partisans of spiritual and temporal despotism all over Europe. The Salic law is no part of the genuine monarchical traditions of Spain, as it was in France, but was introduced by a mere arbitrary and autocratic act of Philip V., in contravention of those traditions, and consequently on true Legitimist principles Isabella has a better claim than Don Carlos. Not that her fall had anything to do with these considerations one way or the other. She lost her crown because her conduct had produced a moral revolution in the heart of her people, but there was as little to admire or respect in her enemies as in her supporters. It was a mistake, the author thinks—and he did not live to see it remedied—in sacrificing her to proscribe her whole family. We may presume therefore that, were he still among us, his sympathies would be with Alfonso.

It is however chiefly in the interests of religion that Montalembert took up his pen, and not to advocate the claims of this or that particular dynasty, and he accordingly animadverts with a very just severity on the Ultramontane view of the situation, which, as we have already seen, is especially enamoured of what he has shown to be the fatal vices of the political and ecclesiastical government of Spain. It is rather amusing, however, to find the *Catholique de Bruxelles* of September 26, 1868, applying to Isabella's sovereignty the very term applied by the *Voce della Verità* in March 1876 to Don Carlos, who had not then come into the field. "Si Isabelle succombait, l'Espagne serait perdue pour le Catholicisme, perdue pour la cause de l'ordre en Europe, et le dernier gouvernement Catholique aurait disparu du vieux monde." As though, remarks the author, Belgium was not a Christian Government, or England, "which for thirty years has reigned a woman who wears the most glorious (*resplendissante*) crown of the modern world without a breath of calumny having ever tarnished her fair fame": and then follows a long and eloquent passage contrasting the reigns of Victoria and Isabella. Montalembert sees nothing to find fault with in the programme of the revolutionary Junta of Madrid in October 1868, though it includes "liberty of worship," which the Ultramontanes indignantly denounce as incompatible with Catholicism, bidding Spain choose between the two, for both together she cannot keep. "And pray, why not? O great and little prophets!" asks their critic; and he challenges them to name a single country in the world where liberty of worship has injured Catholicism, unless it be Italy, where the question is complicated by other and exceptional considerations. On the contrary, speaking as a politician and a practical man, he feels sure that it has gained immensely by this liberty in France, Belgium, Holland, England, Ireland, Germany, and Switzerland; and he denies that this liberty is an invention of Protestantism; "it is the instinctive outgrowth of the modern spirit [illegible] nerve in passing [illegible] matter of history. The Reformers of the sixteenth century, one and all, as we have more than once had occasion to show, proclaimed the principle of intolerance in the most emphatic terms, and acted upon it whenever they had the power. Montalembert, by the way, quotes with warm approval what was, when he wrote, a recent observation of our own (*Saturday Review*, Oct. 17, 1868), that "Sweden is now left alone in her glory as the one persecuting country in Europe." Liberty of worship, he says, is like the printing press; "it may be used for good or evil, but one cannot part with it." Catholics may detest and abuse it, if they choose, instead of taking advantage of it, but they will be obliged to rest content with "a Platonic enmity." That liberty of all kinds may be grossly abused is not at all denied, and there is a severe and powerful criticism, not without a good deal of justice, on the illiberality of Liberals, specially as exemplified not in the professions but the practice of the Spanish Government in 1868. We have no room, however, for any further extracts. Our main object has been to give our readers some notion of the contents of these remarkable papers, which they will find well worth perusing in their entirety. We may perhaps have occasion to return to them hereafter when the series is complete.

SERVANTS.

THE letter to the *Daily Telegraph* in which Mr. Charles Reade, with his accustomed mingling of force and extravagance, lately proposed a simple remedy for an evil state of things which has long existed, has, as might be expected, produced innumerable replies. Mr. Reade, referring to the death of a sempstress by starvation, headed his letter with the striking phrase "Starvation Refusing Plenty," and said that he had observed the world to be full of "live counterparts" who could never find each other out, in spite of the advertisement sheet, which he regards as "an incalculable boon to mankind." This institution, according to him, has done much to bring together "counterpart individuals," but has failed to bring together two counterpart classes consisting of, "say, two thousand honest, virtuous, industrious young women, working hard and half starved," and "at least twenty thousand other women holding out plenty in both hands, and that plenty rejected with scorn by young women of very little merit," or accepted only under certain vexatious conditions. This statement seems a little obscure, but Mr. Reade went on to "speak more plainly," and to assert what is undoubtedly true, that it becomes more and more difficult as time goes on to obtain good servants, and that masters and mistresses are very often the victims of oppression. There is nothing new in this; but since the days of Mr. Leech's "Servantgalism" pictures the matter has fallen more or less out of notice. And there is of course another side to the question which Mr. Leech's keen and just observation did not pass over. All of us know a household or two where the inattention and insolence of servants are clearly enough marked, where an autocratic power is wielded by a butler to whose whims habit induces the whole house to submit, or is divided between him and a long-established upper housemaid who is at no pains to conceal her resentment at the trouble given by the presence of visitors. In such houses the mere inquiry whether the master or mistress is at home is regarded as an insult, and you are made to feel that you experience a signal mark of condescension in receiving an answer to it. Other servants of this class, which may be regarded as the worst, may be seen any evening pushing and scrambling, regardless of anything but their own convenience, to call up carriages at the end of a play. For the unmannerly behaviour which characterizes this class of servants there are invariably faults on both sides to account. Want of consideration leads their employers to regard servants as necessary adjuncts of human life, but as having no part of their own in it, and natural self-assertion leads the servants to draw attention to their existence by making things as unpleasant as they can to their employers and their employers' guests. Thus the relations of master and servant develop into an endurance, on the one side, which is patient from mere laziness of all kinds of discomfort, and an ever-growing tyranny on the other.

It is not of this kind of service that Mr. Reade's letter treated, but it will, we think, be found that the same selfishness among employers which fosters the conduct we have spoken of in the better-paid class of servants operates as a reason against "half-starved sempstresses" entering a service which, according to Mr. Reade, offers every comfort of life in return for very moderate exertions. It is to be feared, however, that he has represented the conditions of service rather as they ought to be than as they are. "It is true," he says, "that a female servant cannot run into the street whenever she likes. But she sometimes goes on errands, and takes her time. She slips out eternally, and gets out one evening, at least, every week. . . . She comes out of a single room, where she pigs with her relations, and she receives as remuneration for her services a nice clean room all to herself." The letter went on to state, what seems to us fair enough, that there is no reason why servants' wages should be raised in proportion to mechanics', as in the latter case the price of provisions has to be considered, while in the former it has not; and it concluded by saying that the pay of a housemaid in kind and money amounts to about 70*l.* a year. There may, no doubt, be housemaids' places corresponding to the attractive description which Mr. Reade has given, but it is doubtful whether a girl who came, as he delicately puts it, from "pigging with her relations," would be capable of filling them. A number of indig-

nant denials that this state of things prevails in the houses whence servants come has naturally enough been sent to the paper where Mr. Reade's letter appeared, and there have been as many denials that either the accommodation or the liberty given to servants in most houses is as desirable as his statements would make it appear. Again, in the slight glance which he has given to the question of character, he has, we must think, greatly exaggerated the ease with which situations can be obtained. Three thousand houses, according to his letter, are open to a young woman "who can prove that she is not a thief." His argument would seem to be that three thousand masters or mistresses have grown so tired of the difficulty of finding good servants that they are ready to take any girl who can prove that she is honest, no matter how little she may know of the duties to be expected from her. We doubt, however, whether the difficulties are so great as to have led to this result. In the ideal household of Mr. Reade's letter it is likely that people would be extremely careful in ascertaining the capabilities of any servant they engaged; and honesty does not necessarily imply an acquaintance with housemaid's work, or even the power of acquiring it. Where servants are well treated, it is presumable that their work is well done, and, however anxious the mistress of a house may be to relieve the distress of an honest sempstress, she may find it impossible to spend time in teaching her a new calling. There are, unfortunately, many people among the class that employs well-paid servants who are, from a variety of causes, extremely careless in giving characters to servants who are leaving them; and experience of this has rendered others proportionately careful in inquiring about the character of servants who apply for places. When a guarantee of all desirable accomplishments is only accepted with searching scrutiny, it is not likely that a girl who can prove nothing in her favour beyond honesty will be received with acclamation. Besides this, it might not be the easiest thing in the world for a sempstress, however admirable her character, to procure a testimony which should ensure her being accepted as an honest servant.

It seems to us that Mr. Reade, in handling his "counterparts," has mixed up two classes. There is a class of people, no doubt, who want servants and who will not be too strict as to the characters of those whom they engage; but it is not among them that servants will find the comforts which Mr. Reade imagines to be held out in every direction. The places which can be obtained with comparative ease are not attractive enough to make the wholesale conversion of sempstresses into housemaids which he proposes at all probable. They are places filled by the drudges whom many men who have lived in lodgings, especially at a University, where this unhappy kind abounds, must have noticed and pitied. The girl who fills such a place as this is emphatically a maid-of-all-work. Employed by tradespeople whose stock of courtesy is entirely reserved for their customers, she is expected, besides doing nearly all the work of the house, to be ready at all times to attend both to her master and mistress and to their lodgers. Her temper is tried in every way from morning till night; if she succeeds in getting through her duties well and cheerfully under great difficulties, she gets no sort of humane recognition for her services from her employers; and if a lodger rashly addresses a kindly word to her, she will probably be accused of shameful conduct in "carrying on" with him. If she is so ill advised as to fall ill, the reproaches addressed to her for her uselessness and the trouble she gives will make her quickly repent. It is small wonder that many servants of this class should be hopeless slatterns, and no wonder at all that the two thousand honest, virtuous, industrious young women of Mr. Reade's letter should not be anxious to fill their places. On the other hand, we need not be surprised if the "twenty thousand other women holding out plenty in both hands" are not all of them ready to take entirely untrained servants into their houses.

A good instance of what is not unfrequently thought and expected of servants has been given by a writer who, answering Mr. Reade's letter, quoted this praise of a servant, presumably of all-work, by a mistress:—"She has been with me nearly a month, and I never saw her equal for work. She never sits down except to her meals, and the day we washed she didn't have a thing but a glass of beer." The same writer explained that she had never had any difficulty in getting good servants, and, according to the account given of her household, this can be easily understood. She suggests, among other things, that a servant is driven into temptation when she is made "to walk about the streets, or sit in a public-house if she is too tired to walk with her sweetheart," because young men are on no pretence allowed in the house. Her letter, which seems to us more to the point than anything else which has appeared on the subject, ends by saying, "Let mistresses try kindness and friendly sympathy. I have done so, and found it answer." There is much truth in this, if it does not go quite to the root of the matter. We are not prepared to deny that the spirit of absurd conceit and encroachment which Mr. Leech ridiculed in his pictures of "Servantgalism" exists now as much as it did then. There is, indeed, an undue tendency to self-glorification among all who sell their manual labour. But in the case of servants we are disposed to believe that this is frequently fostered by the want of humanity of which we have spoken, and that in a house where "kindness and friendly sympathy" (which of course should not degenerate into spoiling) are exercised towards servants there will not be any great difficulty in filling vacant places; though there may be very great difficulty indeed in preventing vacancies from arising oftener than could be wished. In fact, it is really less difficult nowadays to get good servants than to keep them. Two or three years of a good place are usually as much as the capricious restlessness of the modern domestic can bear; and the mistress is exceptionally fortunate whose "kindness and friendly sympathy" have succeeded in producing an attachment that will be proof against the inveterate love of change for the sake of change.

HELIGOLAND.

ON Tuesday evening the House of Lords had a debate on India, the greatest, while on Monday evening it had turned its attention to Heligoland, the smallest, possession of the British Crown. As the number of persons who know where Heligoland is may perhaps be limited, we will mention that it is an island, or rather group of islands, in the German Ocean, twenty-five miles from the mouths of the Elbe, Weser, and Eider. The main island is divided into the cliff and the low land. The cliff is a rock rising to an elevation of 90 to 170 feet above the level of the sea. The summit is a tolerably level plain, about 4,200 paces in circumference. The lowland adjoining has two good harbours. The circumference of the whole island does not exceed three miles. In former ages it was of much greater extent. It has been during many centuries much consumed by the waves, and lately it has been eaten up by rabbits. It was anciently the residence of a chief of the Sicambri, and the seat of worship of a Saxon deity. When the English took possession of it in 1807, during the war with Denmark, it became the depôt for goods which were smuggled into Continental ports; the low land, which had been an uninhabited down, was covered with warehouses; and the population of the island increased to 4,000. More recently it has been a favourite site for gambling-tables, where perhaps the worship of the Saxon deity was continued. On the conclusion of peace in 1814 the English retained possession of the island, probably for the sake of its double harbour, and for the advantage which it offers for defence in having two wells of good water. The English erected batteries and a lighthouse. They placed there a governor and a garrison, but levied no taxes, and did not interfere with the internal government. It is of course under the superintendence of the Colonial Office, and Lord Carnarvon, who is indefatigable in the business of making things pleasant all round with colonists, has not neglected to propitiate the descendants of the Sicambri.

We are indebted to Lord Rosebery for calling our attention to this interesting colony by moving for papers relating to Heligoland. It has been said that by the capitulation of 1807 the ancient rights and liberties of the inhabitants were secured to them, and Lord Rosebery desires to ascertain what those ancient rights and liberties precisely were. It is believed, however, that every householder was entitled to be summoned to a council before any taxation could be imposed on him. Things remained almost unchanged until 1864, when Heligoland, like larger colonies, behoved to have a Constitution. By an Order in Council of that year a Legislative Council was created. It consisted of twelve persons summoned by Royal Warrant; and when questions of taxation were involved, twelve burghers were to be added to the Council by election. By this time, probably, some zealot desires to introduce representative government into the island, and we are quite prepared to hear that the recent plague of rabbits is ascribed to the want of Parliamentary institutions. It appears that in 1866 the Governor reported that the Constitution was working admirably, and two years afterwards it was abolished. If it be true that, while the inhabitants had not paid the taxes imposed on them, the public debt which had amounted to 750*l.* was reduced to 600*l.*, we can only say that charity should begin at home, and we should like to have such a beautiful Constitution among ourselves. We decline to adopt the suggestion which may possibly be offered that the debt was reduced out of the profits of the gambling-table. The Duke of Buckingham, when he was Colonial Secretary, is said to have gone in uniform in a man-of-war to Heligoland, and taken away its bauble of a Constitution. The German newspapers, which naturally take a lively interest in the descendants of the Sicambri, have lately called attention to this alleged grievance, and they complain that, whereas we are always preaching liberty to other Governments, we have summarily abolished the Constitution of one of our own dependencies. Lord Carnarvon, in answer to Lord Rosebery, remarked that the Heligolanders are a sensitive race, as indeed are most of the races with which he is brought into official contact, and he feared that the production of the capitulation of 1807 would wound the susceptibilities of the dependency. Considering that this capitulation is, as he says, an historic document, and that its contents must be perfectly well known to those who were affected by it, Lord Carnarvon's anxiety is perhaps excessive. It may be remembered that Napoleon had by the Peace of Tilsit converted Russia from a dangerous enemy into a subservient friend. Our Government apprehended that he and the Emperor Alexander would employ the Danish fleet against us, and so we determined to seize it ourselves. Whatever may be thought of the justice of this resolution, there can be no question of the vigour with which it was executed. A fleet and army was immediately despatched; and, whereas the battle of Friedland was fought on the 14th June and the Peace of Tilsit concluded on 9th July, the surrender of the Danish fleet was exacted on the 7th September. As a branch of these operations, a small squadron was sent to Heligoland, and while our admiral was preparing to storm the place with his marines

and seamen, a flag of truce arrived, and next day was signed the capitulation which Lord Rosebery now wishes to have produced. Thus the island, which was much wanted as a refuge for our cruisers in these dangerous waters, became a possession of the British Crown, and our traders, we may be sure, promptly utilized its commercial capabilities. The hope which we had founded on the stubborn courage of the Russian armies was dissipated as soon as Napoleon's military genius had full scope. But not even by his splendid victory at Friedland, nor by the confederacy which followed it, could he abate the pertinacity of our resistance. Whatever came of our allies we were never disappointed in ourselves, and it may be doubted whether the vigilance of our cruisers or the activity of our smugglers caused greater irritation to our enemy. It would have been better if we had not imitated the petty spite he showed. When we employed our naval power in cutting off supplies of drugs from Napoleon's confederates, Sydney Smith ridiculed our great scheme for closing, as he said, the ports and the bowels of Northern Europe.

It was against an earlier confederacy of the same kind that Nelson battled in 1801. Twice within seven years Copenhagen heard the thunder of our guns, and the capitulation of Heligoland commemorates our second attack on the nation with which we have now to close a tie. Yet Nelson wrote that the Danes were the brothers, and should never be the enemies, of the English. They might, however, be pardoned in those days for thinking that we had a way of dissembling our love. If, as is likely, the Heligolanders have now German sympathies, they may not feel any particular irritation at looking back at our attacks on Denmark, and at any rate they know their own history. Lord Carnarvon tells us that the capitulation did not confirm ancient rights and liberties. The island is now, he says, in a state of contentment and satisfaction, and he implies that it does not regret the Constitution of 1864. If its people are happier than they were when they could pay off debt without collecting taxes, the Colonial Office has something to be proud of. They may be prosperous; but if they are contented they deserve to be described, in the indignant language of agitation, as wretches whom no sense of wrongs can rouse to vengeance. Their community is probably about as big as one of those "populous places" which lately exercised the sagacity of magistrates at Quarter Sessions. The Colonial Secretary, correcting Lord Rosebery, stated that we supplied Heligoland with a Constitution soon after it came into our possession. It had a Legislative Council consisting of six nominated members, with whom six others were to be associated under certain circumstances. The connexion between the island and Denmark in those days was much closer than it afterwards became, and we regret to learn that, as a result of or contemporaneously with this Danish connexion, it was impossible to recover debts or to enforce legal processes in the island, gambling tables were set up, and, as Lord Carnarvon delicately puts it, "great difficulties arose" as to wrecking and salvage cases. The descendants of the Sicambri seem to have thought that of all slaves the most base is he that pays, and it may be plausibly conjectured that the Saxon deity who was worshipped on the island was identical with Mercury. The Constitution of 1864 is described as "a change in the direction of local self-government," and it may be admitted that the islanders of that day did need an increase of self-government, but in a moral, not political, sense. An extension of the franchise was granted, and there are enthusiasts capable of believing that universal suffrage would cure a propensity to wrecking and gambling, and promote a law-abiding and debt-paying frame of mind. However, that experiment failed, as experiments have failed in larger colonies, and then the Duke of Buckingham went to the island, as above described, and abolished its Constitution with the happiest possible results. Another speaker, being free from official regard for susceptible Sicambri, remarked that at that time it was impossible to serve a writ, and that Heligoland wanted not so much a Constitution as a constable. In fact, it was a sort of Whitefriars with sea air: and even Lord Carnarvon seems to admit that an English officer called Receiver of Wrecks was quite as important in the new system as the Lieutenant-Governor or his Council. So far as could be possible under the authority of the British Crown, this island seems to have approximated to the condition ascribed by a witness in the case of the *Lemme* mutineers to (we think) Isle de Rhé. "I told them it was a Republic, and there were no police, and they had better go ashore." Self-government, in the sense of keeping your hands from picking and stealing, was obviously the want of the islanders, and they have now acquired it. Lord Carnarvon does not directly question the assertion that this island was a Paradise under the lamented Constitution of 1864; but he rather seems to suggest that it was something else, and he positively states that the public debt has been further reduced since the advent of the Wreck Receiver. In fact, there has been rather less liberty and rather more law. The debt of Heligoland does not, so far as we know, figure prominently in the transactions of the Stock Exchange, and the possessor of a few hundred pounds might probably constitute himself sole creditor of this dependency of the British Crown. Lord Carnarvon omits to notice the alarming prevalence of rabbits, and we fear that a Colonial Secretary in uniform on board a man-of-war would produce small impression on them. But we could at all events turn out a few foxes on the island.

THE COASTGUARDSMAN, PAST AND PRESENT.

AMONG the most agreeable objects that enliven the shores of our island are the groups of cottages occupied by the coastguard. Picturesque one can scarcely call them, for the architecture is simple to baldness, and suggestive of Government contracts kept down by close competition; and yet they have generally the picturesqueness of comfortable contrast with surroundings that are often bleak and inhospitable. Dating from the days when our coasts were regularly picketed and a blockade was methodically established against the enterprise of the free-traders, we come upon them in every variety of situation. Now they are arranged bastion-wise on a commanding eminence in the suburb of some seaport or watering-place, in a snug, compact little square with a tall flagstaff in the centre. Again we stumble on them unexpectedly, sheltered in the recess of some "gap" or "chine," where a little stream comes trickling down to the sands, through the deep cleft that time seems to have worn in the chalk cliffs. Most frequently they are perched on the crest of the line of sand hills, with a broad look-out in all directions over "promontory, cape, and bay." And often they form a conspicuous landmark on some flat stretch of grass-grown sand, where the slow shelving shore is intersected by a labyrinth of changing channels, and where mud banks submerged by the rising tides are a perfect paradise for the clamorous sea-fowl. But, whatever the situation, the general effect is almost invariably the same. They are substantial and weather-tight; suggestive of cheery shelter in bright interiors when the wind is howling through the shrouds of the flagstaff, driving the sand and gravel in flying scud along the beach, and churning and grinding the pebbles in the surf with dull, monotonous roar. There are low flat roofs with projecting eaves, and small, strongly secured casements, and the gleam of their spotless whitewash catches any sunlight that may be going. In the neatly palisaded little gardens that stretch before the doors a hard and not unsuccessful struggle is always going on with the unfriendly elements, while the shell-strewn walks are invariably kept in the most perfect order. As you approach them of a warm summer afternoon you are conscious of the briny breeze being just tainted with a faint amphibious smell of tar. It may not be so balmy or romantic as the resinous odours that breathe from the pine-woods of Bayonne or Arcachon, under the fiercer rays of the sun of Gascony; but it is decidedly wholesome, and rather savoury than otherwise. The promiscuous use of pitch and tar gratifies the nautical affections of the inmates. Everything is paid, caulked, and seamed, from the keels of the white-painted boats that are hauled up bottom upwards to the felt-covered shingles over the outhouses, and the frames of the cottage windows, and the palings of the enclosure. Everything, even to the concealed refuse heaps, is trim and shipshape, showing the presence of an easy discipline and the predominance of habits of tidiness and order.

As for the occupants of these oases in the wilderness, the lines would seem to have fallen to them in very pleasant places. The sturdy women are blooming in the redundancy of vigorous health, and the chubby children who are tumbling about on the sand are in as sleek case as turtles or porpoises. Even were less attention paid to sanitary details, it would be difficult for the most perverse ingenuity to make these breezy places unwholesome. Ordinary ailments can scarcely lay hold of constitutions enjoying a perpetual air-bath, where brine, oxygen, and iodine are the chief ingredients; and the most remote association with disorders of the nerves would be on the face of it absurdly impossible. The husbands and fathers of the little households are just what one might expect in men who lead the most salubrious lives in the world and have as few cares as may be. Unless you are of unusually robust make yourself, you are disposed to envy them their stalwart frames, their broad shoulders, their deep chests, and the solid under-limbs on which they roll themselves along. Their easy uniform of dark woollen jersey, with broad collars flung back to let the breezes play round the muscular throat, looks the very picture of serviceable comfort. You can tell at a glance that life sits lightly on them, nor are their duties by any means onerous. They have to keep a bright look-out in the day-time for nothing in particular, which comes very naturally to them; for they have got into the habit of gazing into vacancy. Now and then they are taken out for some gentle exercise in the long boat of the station, and take a leisurely pull along the coast which has a good deal of the character of a pleasure trip. They have some night patrolling to do, which is very much a matter of form, now that smuggling has become a thing almost unheard of. The night walk may not be always agreeable, when they have to face wind and rain in broken weather, or swallow down mouthfuls of the damp sea fog that is swathing everything in a watery mantle. Those heaps of white stones which mark out their beats along the southern chalk cliffs are suggestive of promenades that must often be dreary, and occasionally have a dash of danger as well; for a blunder in their bearings might precipitate them down a depth of a few hundred feet among the shingle and seaweed on the beach below. But on such weather-beaten headlands they have shelter-houses erected where they may seek temporary refuge in the wildest nights, and on the whole these solitary nocturnal walks must be a rather agreeable variety in their existence. No human lot is perfect, however, and the drawbacks to theirs are its routine and monotony. They may, indeed, look forward nowadays to an annual cruise in one of Her Majesty's ships, when they enjoy complete change of scene and revive their old nautical associations. And occasionally, when vessels are in distress on the

coast, they have the excitement of putting out to the assistance of the crew, on working the patent rocket apparatus that is to establish means of communication. But, as a rule, they are driven to betake themselves to desultory lounging, in which, with incessant practice, they become highly accomplished. Occasionally this habit, conspiring with circumstances, tends somewhat to demoralize them. The experienced visitor to famous points of view in the vicinity of popular watering-places learns to sheer away as he sees the preventive man standing off and on with an elaborate air of attention to everything except the stranger advancing in his direction. For when the unwary wanderer comes within easy hailing distance, the look-out is apt to bear down suddenly and grapple him. Then the customary observations as to the weather are followed by the friendly tender of the telescope, and you know that before you may pursue your way you must pay your shilling if you care not to be considered shabby. But the coastguard watch in less frequented places is usually a well-informed local guide, of frank but by no means obtrusive manners, with a fair share of intelligence and possibly a store of professional traditions. He will not only explain the geography of the neighbourhood, and enlighten you as to aquatic matters generally, but he will confide to you as you grow friendly how time hangs heavy with him, and will indulge in half-grumbling reminiscences of those good old times when the duties of the preventive guard were no sinecure.

And indeed there were few lives more active, exciting, and unpopular than theirs when import duties were excessive, and lucky smugglers made rapid fortunes. The sympathies of the whole adjacent country were against them. Half the country people were employed from time to time in running illicit cargoes, and made a very profitable thing of it. Those were the days of hard drinking, and farmers almost openly encouraged a trade that dropped kegs of cheap Hollands and runlets of pure French brandy at their very doors. As for the women, of course—to say nothing of their romantic sympathies with daring law-breakers—they were all in favour of the men who filled and sweetened the cheering tea-cup that would otherwise have been altogether beyond their means. Even gentlemen holding His Majesty's commission of the peace were said to connive at the "fair trade" for a consideration, and to express no surprise at the production of mysterious casks that had been concealed in out-of-the-way corners of their premises. There were certain depôts in dry caverns, in remote farmsteads or sequestered barns, the secret of which was religiously preserved, although it was the common property of highly questionable characters. There were codes of signals which could be clearly read by all but the preventive men, and which gave notice of danger or of a favourable opportunity as the case might be. The officer in charge of the station had his faculties preternaturally sharpened, and could scent something wrong in the most natural incidents. The wreaths of smoke rising from a heap of burning weeds might convey a warning to some expected vessel. A fishing-boat putting out to sea, engaged apparently in its lawful business, might really be bound on a similar errand. Then it was the business of the day watch to scan carefully each craft that appeared off the coast, and his natural vigilance was stimulated by the prize-money that might fall to his share. Then the nocturnal promenade was no mere formality. The thicker the night, the more likely that something might be going on under cover of the fog; and the ear of the look-out was always bent to distinguish, amidst the murmur of the waves, the sound of suppressed voices or the plash of muffled oars. Nor was the walk by any means free from personal danger, and indeed it was seldom taken in solitude. For, even apart from the inveterate animosity existing between the smugglers and the preventive men, those were days when deeds of violence were common, and the life of a man was of little account compared to the safety of a cargo that might be worth hundreds or thousands of pounds. If he chanced to fall over the cliff by accident, everything might be settled satisfactorily before he was replaced. For, when a smuggling lugger stood in for the coast, there were plenty of ready hands to help to discharge her cargo, and unless the men of the nearest preventive station got assistance from elsewhere, there was little left to them but to look on helplessly. Boats from the nearest fishing hamlets swarmed in about the smuggler. Strings of horses, in charge of people armed to the teeth, made their way to the coast from the inland farms. The contraband goods were made up in kegs and bags of convenient size for easy landing; they were transferred from the ship to the boat, from the boat to the beach, from the beach to the pack-saddle, with incredible celerity; and, when the mounted caravans set themselves in motion, those who had assisted at the landing hastened to vanish as they had come. On these occasions the smugglers scored a trick in the game, and the coastguard had nothing for it but to wait their turn of revenge with redoubled vigilance. More frequently, however, they succeeded in spoiling sport, for it paid the smuggler amply to run one cargo in three. The Government people would keep such a sharp look-out that, oftener than not, the friends of the free-traders could only help them by signalling danger, and the richly freighted lugger had to put up her helm in despair, perhaps with one of the revenue cutters in hot pursuit. Or, what was better still, the enemy was surprised in the very act of unlading, and a valuable capture was effected. Of course a successful exploit of this kind was by no means all pleasure and profit. The smugglers, with their friends disguised by blackened faces, were sure to show fight if they had any chance. As they were busy in the bay and the unlading was going briskly forward, their sentinels would give the signal of alarm, and the long galleys of the coastguard would be seen pulling fast inshore, and stealing like wolves on their prey from round the nearest headland. The attacking force would have free play with its muskets and carabines if it came within [illegible], and the attacked had to consider that their enemies on the water had probably allies on the land in the shape of Excise officers backed up by soldiers. So the next act in the drama was a *sauve qui peut*, conducted with more or less order, and covered with a lavish use of firearms and cutlasses. Very possibly the victors had to count the dead and pick up wounded; and thus the romance and excitement of those days were spiced with a very sensible element of danger. But if the modern coastguardsman may be tempted to regret those vanished times with their fun and their prizes, it is matter of congratulation for the country that he has to reserve his energies nowadays against the chance of their being required by the Admiralty for purposes of national defence.

THE PERILS OF CIVILIZATION.

IT is said that, by the progress of medicine, and the better appreciation of sanitary laws, the average duration of life is gradually being extended; but, on the other hand, it is impossible to shut our eyes to the fact that the advance of civilization also tends to the introduction of many new perils. The use, for instance, of dynamite for homicidal purposes is probably only in its infancy. Some crude experiments have been made, but in the course of years the nature of the apparatus required will, no doubt, be better understood, and widely extended. Railway accidents are another illustration of the deadly effects of improved mechanics; and in another sphere even such a small invention as roller-skating has apparently added largely to the number of broken bones and injured spines which were formerly confined to the comparatively small class who seek amusement in the hunting-field. It may be thought, however, that people who go out of their way to meddle with dangerous chemicals, or to seek sport in dangerous exercises, have only themselves to blame if they come to grief. But walking about in the streets is not altogether a matter of taste; for most people it is a necessity, and the perils which are thus encountered are not counted, but are of the kind which cannot be avoided. The misanthropical van-driver and the bloodthirsty butcher-boy are familiar dangers of the streets; but there are also other perils of a serious kind to which people are constantly exposed, but of which they have no suspicion till some shocking accident brings them under notice. An instance of this kind occurred the other day, when a man had his throat cut by some telegraph wires which had been blown down. The wires had been stretched across a street, and, having been blown down by the gale, formed a loop over a gateway through which the deceased had to drive an omnibus. His neck was caught in this noose, and the tissues of the throat severed, so that he died instantaneously. Such a danger as that of an iron instrument coming down in this way, as from the skies, and cutting the throat of a person in the street, is one against which it is impossible for the threatened victim to guard; and it is obvious that all who happen to pass that way at the critical moment are equally jeopardized. Any one who in going through London chooses to lift his eyes can see for himself the risks to which he is thus exposed. Sir John Hawkshaw, the eminent engineer, has pointed out with emphatic conciseness what is likely to happen from the present method of carrying telegraph wires across the streets. Galvanized wire, he says, in a smoky atmosphere, does not last more than a dozen years, and the first indication of decay will probably be the falling of the wires upon the passers-by; and the weight of the wires, and the height from which they will fall, will be generally sufficient to kill and maim those upon whom they fall. Sir John added that he did not happen to know who might be made responsible for such accidents; but Lord John Manners has since admitted the responsibility of the Post Office for postal wires, and that, as far as possible, they ought to be carried underground. Some five hundred and fifty-four miles of wire have, it is said, been laid in this way during the last two years. In the meantime, however, Sir J. Hawkshaw's suggestion that, if wires are to cross the streets, they should do so at right angles in the shortest way, instead of, as at present, being extended obliquely to a distant point on the other side, commends itself to common sense, for the existing system is, as he justly observes, ingeniously contrived to do the greatest amount of mischief to the greatest number. It may perhaps be said that there has been only one isolated and exceptional case of danger to human life from this cause; but it must be remembered that this plan of stretching wires across the streets is of comparatively recent date, and that the time is now arriving when the wires are becoming weak and brittle. No doubt there is some system of inspection; but the question is whether this inspection is sufficiently close and careful. The wires which killed the omnibus-driver the other day had, it seems, been up for six years, and had not long since been passed as sound for a further term. Nothing is said in the report of any evidence having been given as to their actual condition.

Probably few people would have suspected that, if the telegraph wires happened for any reason to come down, the accident would produce such fatal effects; and it may be admitted that in the present instance there was probably

something exceptional in the way in which the loop was formed in which the unfortunate man's head was caught. Even, however, if the falling wires did not kill, they would be likely to inflict severe wounds; and the commotion which such an incident would produce amidst the traffic of a crowded thoroughfare, especially if it happened in the day-time, would in itself constitute a serious danger. Moreover, the gravity of the question is increased by the large extension of this system of erecting telegraph-wires along the roofs which has taken place in recent years, and is continually going on. Not only the Post Office, but various Companies and private persons, make use of wires in this way, and, if the practice continues, it may soon be expected that over a great part of London there will be a closely-woven meshwork of wires stretching across the chief thoroughfares. It may be doubted, therefore, whether any modification of the present system, such as laying down a rule that wires must be carried across the road only at right angles, will be sufficient to meet the difficulty; and whether these dangerous constructions on the tops of houses will not have to be absolutely prohibited. It is stated that during the recent gales a great many poles were thrown down, and the wires twisted and blown about in all sorts of fantastic ways. Here we have a source of danger both to roofs and chimneys as well as to people in the streets below. It is easy to conceive the wires getting entangled with a stack of chimneys, and pulling them down with a sudden haul, and in such a case there would be a great risk of the wreck of the chimneys going through the roof into the house beneath, or into the street. It appears that a large part of the telegraphic intercourse of London is already carried on by underground wires; and this system has many recommendations. The wires are not exposed to the weather as those are which are elevated on the tops of houses; and they can be more readily got at and mended when out of repair. Along the lines of railway and in country districts the poles and wires are of course less inconvenient and dangerous; but even there they are apt to be the cause of mischief by being blown down upon the rails, where they may form a serious obstruction of traffic, as indeed happened on Sunday last when the Empress of Austria was returning from Windsor to London. In the large towns, however, there can be no doubt that over-house telegraphs are very much out of place, and those who erect them must not be surprised to find a strong protest raised against their continuance.

There is an objection to any reform in this way which is pretty sure to be raised, and which involves an important principle in regard to the rights of the public. It will no doubt be said that to substitute underground communications for those which are now carried aloft would throw a very heavy outlay on those on whom the obligation devolved; and it may be assumed that, to some extent, this would be the case, though there would be a saving in the rent paid for passing over houses, and probably in the cost of maintenance and repairs. Admitting, however, that it would be costly and troublesome, we have to ask whether in such a case the public has not the first and paramount right to consideration. This is the usual cry of the Railway Companies when any urgent reform in their system is pressed upon them. "What!" they exclaim, "you expect us to have carriages of uniform construction, a strict correspondence between the level of carriage doorways and of landing-places, improved signals, efficient brakes, and so on; but just think of the expense, and the effect on our dividends!" When it is proposed that the railways should double their lines because they have more than doubled their traffic, the same plea is heard again—"Oh! but this would be so expensive for the Companies." The answer is that Companies have no right to subordinate the safety of the public to their own private pecuniary interests. It is impossible to admit that anybody has a right to endanger the lives of the community in order to make a large profit. What would be said if a man got leave to build a bridge for the use of the public, and it was so rotten and ricketty that people were always tumbling through and being drowned? Would it be an excuse to say that the proprietor could not make a handsome income for himself if he kept the bridge in such a condition as would be perfectly safe? A Railway Company which cannot do its work without slaughtering so many people every year just because it does not choose to pay for an efficient staff, a highway roomy enough for its traffic, and plant of the best kind, has no right to exist at all, and the same principle applies to all other public enterprises. It is not a question of how many people may be allowed to be killed in a year in order to put money into other people's pockets; the question begins at an earlier point, and is simply whether anybody is to be killed at all if it can be avoided. After the opinion expressed with regard to telegraph wires by so high and practical an authority as Sir John Hawkshaw, it can hardly be contended that the public is bound to submit to this artificial and unnecessary peril for the convenience of the people, whoever they may be, who use this means of communication. The proper place for the telegraph wires in a densely populated town is underground, and if that is expensive, it is only one of the natural conditions of the business. The Tramway Companies already monopolize a considerable share of the public thoroughfares, and if we are to have large lumbering waggons blocking up the roadway, and a maze of telegraph wires woven overhead, and threatening at any moment to fall down and maim or kill the people in the streets, the ordinary perils of London life will be seriously augmented. And this brings us to another question which also demands attention—that is, the necessity of having the under part of at least the chief thoroughfares so arranged that it may be possible to lay or repair telegraph wires, gas-pipes, water-pipes, and so on, without having the whole traffic obstructed for an indefinite period of every year. The complete realization of this dream is probably remote, but some attempt ought to be made to carry it out; and, at any rate, the public ought not to be kept uneasy by telegraph poles and wires in windy situations.

DEGREES IN MURDER.

A BILL has been brought into the House of Commons reciting that the various offences which are legally characterized as murder differ greatly from each other "in heinousness and atrocity," and it is not just that the same punishment should be alike applicable to all. We of course entirely agree that the law is in this respect imperfect, and we should like to see—what we do not see—a Bill that would amend it. The apportionment of punishment must always be to some extent discretionary, and it is impossible to formulate in rules all the considerations which may properly influence a criminal judge. The sentiment of early ages is expressed by Shakspeare in reference to Iago, and there are still, perhaps, persons capable of regretting that such a monster of wickedness as the contriver of the Bremerhaven explosion could at most be simply hanged. But if you can only hang for the worst homicide, it seems to follow that you ought not to hang in cases distinctly short of extreme guilt; and, indeed, our law attempts to meet, although not very satisfactorily, what may be taken to be a prevailing sentiment. The distinction between murder and manslaughter has been called "an indulgence shown to the frailties of human nature"; and it has been said that, if two happen to fall out upon a sudden, and presently agree to fight, and each of them fetch a weapon and go into the field, and there one kill the other, he is guilty of manslaughter only, "because he did it in the heat of blood."

In a case which occurred rather more than a century ago a jury found that Taylor, "being a sergeant in the first regiment of our Lord the King of foot,' was in a taphouse or alehouse in Lambeth, and was there drinking with another soldier and a gardener, being all three Scotchmen, and Edwards and Pepper were there likewise drinking in another box in the same room, and Edwards, without any provocation given by Taylor or his company, said of them, "They are Lord Bute's countrymen." The conversation proceeded thus:—"Do you know any harm of them?" "No, nor any good." "Yes, in the last war they did great service to their country by fighting the savages in America." "It was fit one savage should fight against another." When Edwards said this, Taylor struck him with a small rattan cane, and the gardener struck Edwards with his fist. Edwards, who was a servant of the house, then fetched other servants, and Taylor was bidden to pay for his liquor and be gone. Smith, who was neither master nor servant, thereupon intervened, called Taylor "rascal," and as Taylor was going away laid hold of him by the collar, and said he should not go without paying, and threw him down against a settle. Taylor then paid, whereupon Smith again laid hold of him by the collar, and shoved him out of the room into the passage, whereupon Taylor said "that he did not mind killing an Englishman more than eating a mess of crowdy." Smith and Edwards then violently pushed Taylor out of the alehouse; whereupon Taylor instantly turned round, drew his sword, stabbed Smith, and gave him the wound of which he died. The Court declared that this finding of the jury could only amount to manslaughter; for "words are not sufficient provocation, but blows are provocation sufficient to lessen the crime into manslaughter." The Court said further that the case was stronger (in favour of Taylor) than many of the cases where it had been determined to be only manslaughter.

We are told that in early times the killing of any man through malice prepense was by degrees called murder and punished with death. But by the common law "clergy" was promiscuously allowed as well in cases of murder as of manslaughter before certain statutes of King Henry VIII., by which "clergy" was taken away from murder *ex malitiâ præcogitatâ*. This practice of allowing "clergy" prevailed in the last century, and accordingly we find that Taylor, sergeant in the First Regiment of Foot, fell on his knees at the bar and prayed the benefit of his clergy, and was burned in the hand and discharged. By the practice which then prevailed of finding a special verdict, the jury submitted the facts to the Court, and left the Court to say whether malice prepense was proved, or, in other words, whether the killing was murder or only manslaughter. Now the judge explains to the jury, as well as he can, the distinction between these two terms, and leaves the jury to decide which they will apply to the case before them. The judge carries in his mind more or less of the charges of his predecessors in similar cases, and expresses what he remembers with more or less accuracy and lucidity. As to some cases it will be easy to say on which side of the line they fall; as to others it will be very difficult. But in many cases a narrative has to be constructed on the imperfect recollection of witnesses of a number of circumstances which preceded and attended the killing, and the jury have to decide on the whole between the two alternatives presented to them. This practice may, or may not, be capable of improvement; but we do not think it will be improved by a Bill which proposes to enact that murder in the first degree is unlawful killing, "with deliberate intent so to kill, or [illegible] malice afore-

thought." Suppose that, Taylor being drunk and disorderly, the master of the ale-house and his servants put him out with no unnecessary violence, and he instantly turned round and mortally stabbed one of them. Again, suppose that they used more or less of unnecessary violence, and he did the same thing. The suddenness of the impulse is evidently not the criterion, because it would be exactly the same in the three cases of no unnecessary violence, of little, or of much, and so we are not much helped by looking for "deliberate intent." The term "malice aforethought" has been always used, and in the case of the Scotch soldier the Court looked to the degree of provocation, and finding it considerable, decided that he was only guilty of "feloniously killing" Smith, or, in other words, that "malice prepense" was wanting. It may be doubted whether anything is gained by this or any other adjective. There have been, or at least the "mad doctors" tell us that there may be, cases of killing by sudden momentary impulse which they call uncontrollable. If such a case did occur, the killer would be, or at least ought to be, hanged, and he could not be hanged without being found guilty of killing of "malice aforethought." Yet he may have taken no more thought than a man does who takes a "snap shot" at a rabbit.

Cases of homicide under the influence of drink are unfortunately frequent, and the law deals with them on the whole satisfactorily, although judges are not always happy in explaining the grounds on which they proceed. It is commonly said that drunkenness is no excuse for crime, but it would be easy to show that this principle is not practised quite so uniformly as it is preached. In the too common case of a man of brutal savage nature who, under excitement of liquor, beats, kicks, jumps upon, and perhaps kills, a woman, it may be fairly said that, if the man's nature were not brutal and savage, drink would not excite it to this violence. But suppose a man in a drunken fury sets fire to a neighbour's house, and the indictment for arson charges him in the usual form that he did this "with intent to injure" his neighbour, and there is no evidence of the intent beyond the act. It would be easy to produce cases in which this has not been held sufficient; and yet, as a general principle, a man must be supposed to intend the natural consequence of his act. A man went into another man's house, and "was very abusive," and a constable was desired to turn him out. While the constable was taking him off the premises, he stabbed the constable with a fork. He was "something the worse for liquor." Being tried for stabbing with intent to murder, Baron Alderson said, or is reported to have said, after observing that intoxication did not alter the nature of the offence, that, "with regard to the intention, drunkenness may perhaps be adverted to according to the nature of the instrument used. If a man uses a stick, you would not infer a malicious intent so strongly against him, if drunk, when he made an intemperate use of it, as you would if he had used a different kind of weapon." It is hard on a judge that, after the lapse of forty years, he should be made answerable for all that appears of his dicta in the reports. But if Baron Alderson had heard any one else say this, he would probably have asked why sober men as well as drunkards should not have the benefit of the distinction between a stick and a fork. He could not have meant to say that in lighter cases drink may be an excuse or palliation, but when it comes to killing or wounding, the law must show unmitigated severity; and yet that is nearly what he is made to say. In another case, where a dictum of a learned judge was cited to the effect that in a charge of murder, on the question whether the act was premeditated, intoxication might be taken into account, the Court said, "there would be no safety for human life if that were law"; and it certainly is not law. We are not a logical, but a practical, people; and although it might be argued with much force that murder by contrived poisoning and murder in drunken fury imply different degrees of wickedness, we should answer that we must hang for the latter, and we can only hang for the former. But, if this be so, the comparative "heinousness and atrocity" of murders seems scarcely to furnish ground for legislative action.

A case tried this week at Maidstone may serve as a test of the value of the Bill. It appeared that on the evening of Saturday, 8th January, the prisoner and a woman with whom he cohabited were on their way to a barn outside Margate, where they sometimes passed the night. They visited three drinking-houses, and they had, at one house, according to the evidence, "five half-quarterns" of gin, which Lord Coleridge, from a mistake easily made in reading the figures of his own notes, stated to the jury as "five and a half quarterns." The mistake was corrected, and thus the quantity of gin alleged to have been consumed was reduced by more than half. It is, however, always difficult to attain exactness on these points, and it would be dangerous to pay much heed to arguments from the prisoner's condition some time after the woman's death to show what his condition was before her death. When we are told that a prisoner "had been drinking, but was not drunk," we can form our own judgment as to his condition. He seems to have been possessed with a sort of madness for which drink was the only apparent cause. If he beat and kicked the woman in a drunken fury, he only followed the example of other men to whom the law has been more merciful than it is likely to be to him. But why did he tear off and carry away her clothes? Supposing him to be capable of thought, he would perceive that suspicion would point to him as the person last seen with her, and no marks upon her clothes could possibly be more damning to him than his making away with her clothes to prevent examination of them. But, assuming that the prisoner was at 9 or 10 o'clock that night when the woman came by her death considerably under the influence of drink, the killing, *if* he killed her, as the jury believed he did, would still be murder. *If* the victim had been a man we might suppose a quarrel and a struggle, and here the quantity and effect of the drink taken become material. But it is difficult to frame any hypothesis on which there could be provocation by a woman sufficient to negative the legal presumption of malice—in other words, to reduce the crime from murder to manslaughter—and besides, the man did not suggest anything of the kind. Lord Coleridge, in answer to the argument that the prisoner was too drunk to have the deliberate intent to kill, said that he must hold that this was not material, assuming that the prisoner committed these acts of violence; and here he spoke correctly the language of the law. It may be added that, if ever there could be a time when this class of murder might be treated leniently, the present does not seem to be that time, but quite otherwise. The Bill to which we have referred comes to this; that murder, as it has actually been defined, shall be murder in the first degree, and murder which is not murder in the first degree shall be murder in the second degree. The old distinction between murder and manslaughter is quite as rational as this gradation of murders, and has the advantage of being familiar. Unless something more effectual can be done to amend the law of homicide, it had better be let alone. Until human thought and language shall attain perfection, which now seems distant, it will be necessary to leave a large discretion to judges or Ministers of State.

REVIEWS.

WILLIAM OF CANTERBURY.*

WITH a yearning second only to the yearning with which we have longed for Dr. Dasent's long-promised sagas, have we been longing for an intelligible edition of the vast mass of materials which have gathered round the quarrel between Henry the Second and Thomas of Canterbury.. Those only who have tried to master the subject in the edition of Dr. Giles know how great is the lack. Any editor might set about his work with one great advantage; he must do it comparatively well; human imagination cannot go so far as to conceive an edition worse done than those of Dr. Giles. We are therefore inclined to welcome anything of the kind from Mr. Robertson or from anybody else. We might possibly think that so great a subject should have been entrusted to the greatest scholar, and that no hand save that which drew Henry should be allowed to touch Thomas. But, without descending to the depth of Dr. Giles, the work might easily have fallen into much worse hands than those of Mr. Robertson. Mr. Robertson is described in his title-page as Canon of Canterbury, so that he may be supposed to have some local knowledge of and interest in his subject. And some years back he put forth a work on the subject itself, whose alliterative title caused some mirth among scholars, but which was plainly the result of solid work. "Becket, a Biography," as the lettering of Mr. Robertson's book ran, showed in a curious way how well a man may understand the details of a subject without in the least understanding the subject itself. Mr. Robertson showed himself equally removed from the class of blunderers and from the class of historians. He was minutely accurate in detail; only Henry and Thomas were both of them too great for him to take in. Some may think that for an editor accuracy in detail is enough, and that it does not much matter whether he understands the general subject or not. Some years back we might have been inclined to think so too; but our standard of editorship has been raised by the great volumes in this same series. Still we believe that Mr. Robertson may do very fairly, if he will only keep himself from joking, even at Dr. Giles. We would give him one other warning. He says in the beginning of his Introduction that

> In a work produced with the aid of public money it would be improper to obtrude opinions which might offend the convictions either of those who regard him [Becket] with a religious veneration or of those who estimate him very differently.

Mr. Robertson does not seem to understand that there are those with whom everything is not a matter of theological controversy. There are those who can admire two great men, each honestly engaged in a great struggle, without personally committing themselves to the position of either.

The volume now before us, the first of Mr. Robertson's edition, gives us a large proportion of strictly original matter. It contains first the full text of the Life of Thomas by William of Canterbury, which has hitherto been published in a fragmentary form only; and it contains also a collection by the same writer of the miracles of the Saint, which, as far as we know, has not been printed at all before. The Life is one of those which went to form the Quadrilogus of Lupus (Christian Wolf) and the fragments which are used there were printed by Dr. Giles in his second volume. Here we have the work complete, and it is well worth having. In Roger of Pontigny we have the Life of Thomas written by a foreigner who knew him in exile. In Edward Grim we have it written by a man who was English in every sense. In William

* *Materials for the History of Thomas Becket, Archbishop of Canterbury.* Edited by James Craigie Robertson, M.A. Vol. I. London: Longmans & Co. 1875.

FitzStephen and Herbert of Bosham we have the witness of men who were English "natione," whether they were or were not English "genere." In William of Canterbury we have the Life written by a foreigner dwelling in England. Mr. Robertson is clearly right in setting down William as a stranger, neither an Englishman in the strictest sense nor a man of Norman descent born in England. When he comes across English words and names, he writes like a man who had just picked up a little English and thought it rather hard. He complains of the barbarous names which he has to put in his story, and he alone among the biographers of Thomas gives us a complete English sentence. Roger of Pontigny doubtless never heard Thomas and his companions speak anything but French or Latin. The biographers who wrote in England were so used to hear English, French, and Latin, all spoken according to circumstances, that it never came into their heads to say which tongue a man spoke at any particular time. To William, as a stranger, an English sentence was a curiosity, and he copied it down as such. By so doing he gives us a very valuable piece of testimony in the history of language. When Hugh of Morville's mother—Mr. Robertson has shown that it should be mother and not wife—brings her false charge against Lithulf (Ligulf?), she speaks English:—

Quod cum faceret, patria voce exclamavit ad præsentem virum, "Huge de Morevile, ware, ware, ware, Lithulf heth his swerd adrage." Quod Latine sonat, "Hugo de Morvilla, cave, cave, cave, Lithulfus, eduxit suum gladium."

Every MS. writes the words differently; but there is the fact; the mother of Hugh of Morville, a man whose Norman descent cannot be doubted, speaks English to her son. She may herself have been of English descent; as to that we have no evidence. But it is clear that her son understood English, and in any case the story is a witness to the thorough fusion of Normans and English in the time of Henry the Second. Either Hugh of Morville's father had married a woman who was English in the strictest sense, or else by his time a woman of Norman descent spoke English more naturally than French. The witness is about equally valuable either way, and we no doubt owe it to the fact that the man who recorded it was not an Englishman in any sense. While on this subject we may also notice that William speaks of Edward Grim in a marked way as "Anglicus natu, Edwardus nomine." In another place he calls the Bishop of Norwich "Episcopus Helmaniensis." This must, of course, as Mr. Robertson says, mean Bishop of Elmham; but the archaism is odd, and it looks like the way in which a stranger might speak who had been getting up the antiquities of the land in which he had settled. On the other hand, we may mention that either Mr. Robertson or the writer of his manuscript has wiped out a small piece of witness to the fusion. On page 108 we find "Willelmus filius Aldelinæ," as if it were the name of his mother; but it should without doubt be "Willelmus filius Aldelmi," a man whose name is found over and over again in the history of Henry. Of the descent of William the son of Ealdhelm there can be no doubt, and his high position under the Angevin King is a point of importance. It may be worth noting that William of Canterbury, in settling in England, had taken his fill of the fables which everybody in England except William of Newburgh was greedily swallowing down. In page 55 he has something to say about Belinus and Arthur, and he has so far identified himself with the land of Arthur that he speaks of "arrogantia nostra" with a clear reference to inhabitants of the Isle of Britain. Lanfranc, it must be remembered, went further still, and spoke of "insula nostra" and "nos Angli."

William, then, was a monk of Christ Church, but of foreign birth, and his personal knowledge of Thomas began only in the last days of the Archbishop's life. He had been admitted to the monastery during the Archbishop's exile, and he was ordained deacon by him in the Ember-week before his death. Of his two books, the whole of the second is given to the events which followed the return of Thomas to England, while the whole of his former life is comprised in the first, which is certainly the longer of the two. The part of the story for which William is specially important is his very full narrative of the transactions which went on at the court of the young King Henry after the return of Thomas to England. It is among these transactions that William the son of Ealdhelm comes in, a grand turning round of Thierry's romance, where the man of undoubted English descent appears as one of the opponents of the supposed "Saxon" champion.
